tion was reduced by one-half, thus doubling the vulcanizing output without extra heat or pressure. The theory of catalytic action, according to M. André Dubosc, an eminent French chemist, is explained as follows. He found that when a typical organic accelerator derived from an amine, such as hexamethylene tetramine, was mixed with sulphur, placed in a sealed tube; and heated to 135°-145° C., not only carbon sulphide or hydrosulphuric acid but also sulphocyanic acid was evolved. At the vulcanization temperature, sulphocyanic acid separated, yielding hexavalent sulphur and cyanhydric acid. While the same temperature was maintained, this acid combined in the presence of ordinary divalent sulphur, producing unstable sulphocyanic acid which by dissociation again furnished hexavalent sulphur. M. Dubosc holds that cyanhydric acid is the true active agent in such catalysis, the practical effect of which is the transformation of ordinary divalent sulphur into hexavalent sulphur. Assuming that vulcanization is the saturation by sulphur of a double bond in the rubber molecule, then by saturation of two such bonds the speed of the reaction between sulphur and rubber should be doubled, and by saturation of three bonds the speed would be tripled. Saturation is accomplished with hexavalent sulphur generated during vulcanization through catalysing action of cyanhydric acid, evidently the true accelerator, and corresponding to Dr. Spence's "active principle." While a single molecule of rubber reacting with ordinary divalent sulphur will saturate only one double bond, hexavalent sulphur in vulcanizing may saturate three double bonds belonging to rubber with which it is in contact and during its polymerization, which M. Dubosc explains thus: (1) In the case of an aggregate of rubber molecules, the end molecules, which have a double bond, will be broken and give a molecule of rubber of which the four valences will be saturated. The aggregate will have its polymerization increased by one molecule and its resistance to break will be modified in a slight degree only. (2) In the case of vulcanization with hexavalent sulphur, saturation of the terminal free valences of three physical aggregates of rubber will take place. Polymerization will therefore be three times as great as that produced with ordinary vulcanizations, because it acts on three aggregates instead of one. Resistance to break, dependent on polymerization, will therefore be much increased and its theoretical tripling has been demonstrated experimentally. This theory would appear to apply not only to the amino (NH₂) or imino (NH) groups, but also to the nitroso compounds discovered by Peachey. Nitroso bodies decompose during vulcanization and generate cyanic acid. The latter, influenced by sulphur, yields sulphurous anhydride and sulphocyanic acid. The acid dissociates and leaves hexavalent sulphur, and the liberated cyanhydric acid again functions as a catalyser.

The most important organic catalysers are: (1) Aniline, extensively employed to quicken the combining of rubber and sulphur in vulcanization, particularly in the manufacture of tires and tubes, and obtained through a series of chemical transformations from coal-tar. It is an oily liquid boiling at 184.8° C. Special precautions are taken to carry off its noxious fumes and prevent contact of the oil with the skin of the workers. (2) Carbon bisulphide with aniline, diphenylthiourea or thiocarbonyl, melting at 154° C., used for quick-curing stocks. (3) Carbon bisulphide with dimethylamine; effects vulcanization within 15 minutes at 135° C. (4) Carbon bisulphide with either dimethylaniline, tetrahydropyrrole or dimethyl X methyl trimethylene amine. (5) Ammonium borate; effective but not practicable. (6) Aldehyde ammonia; melts between 70 and 80° C.; a very useful catalyser. (7) Quaternary ammonium bases; patented, rapid accelerators with aldehyde ammonia, para-phenylenediamine, sodium amide, benzylamine and naphthylenediamine. (8) Accelerene; widely used and powerful English catalyser. Used in one-third to one-half of 1% reduces vulcanizing period to one-third of normal, and with quick repair compounds to one-eighth. It owes its activity to the presence of the nitroso group and adds notably to tensile strength of goods. (9) Para-phenylene-diamine; a very poisonous catalyser melting at 140° C., and subliming at 267° C., used with synthetic rubber. (10) Tetramethylenediamine; a substance formed from decomposing animal matter such as fish; called also putrescin. (11) Hexamethylene-tetramine; known also as hexamethylenimine and formalin; an accelerator largely used; caution is required in its use as it is not only very soluble in water but vaporizes freely, irritating the exposed skin of the workmen. (12) Piperidine or aminopentane; a liquid easily miscible in water, boiling

at 105-7° C. and smelling like pepper and ammonia. A prototype of the more recently discovered organic catalysers, it was brought out in 1912 for use in making synthetic rubber, but was soon found to be of remarkable value for vulcanizing hard and soft natural rubber, cutting down the curing time three-fourths. (13) Methyl piperidine; an active catalyser boiling at 107° C. (14) Quinoline; a good accelerator, boiling at 240° C. and with a strong, disagreeable odour; little used. (15) Quinoline sulphate; a catalyser yielding good-looking, well-vulcanized rubber. (16) Hydroxy-quinoline; regarded as a valuable accelerator. It melts at 76° C., boils at 266-6° C., and is soluble in alcohol and volatile with steam. (17) Quinowol; a catalyser of special value to users of litharge, such as rubber-footwear manufacturers. It cuts the vulcanizing period one-half. (18) Oxidquinoline and oxidquinoline sulphonic acid; the latter gives good acceleration but porous rubber. (19) Oxiquinoline sulphide; a catalyser that can be used in practically every kind of vulcanizing; regarded by some as too rapid. (20) Anthraquinone; a catalyser used in batches containing rubber substitutes and cutting curing-time three-fourths. (21) Antipyrine and (22) naphthylamine; act like anthraquinone. (23) Urea formalilide, (24) thioformanilide and (25) guanidine are useful catalysers.

The Manufacture of Rubber Goods.—The manufacture of rubber goods begins with the tearing of the rubber into shreds, passing it between corrugated rolls and washing out the impurities. A stream of water flowing over the rolls carries off a large part of the dirt, while the rolls flatten the rubber into a thin sheet. The sheets require drying, after which they are ready for mixing with sulphur and other substances into what are called compounds. Compounding is done either on a machine called a masticator or in a mixing mill which kneads the mass until it is homogeneous. The rubber is next run into sheets, cut into various shapes, built up over forms and lastly baked or vulcanized. Hard rubber is handled in much the same manner except that after vulcanization it may be turned, shaped, buffed and polished. A list of the uses to which rubber is put would, if complete to-day, be only partial to-morrow. The main lines of its use may be briefly indicated as follows:—mechanical rubber goods; pneumatic and solid tires (*see* Tyres); moulded work; drug-gists' and stationers' sundries; dental and stamp rubbers; surface clothing; carriage cloth; mackintoshes and proofing; boots and shoes; insulated wire; hard rubber; cements; notions; plasters. Such a list, not of articles manufactured but of special lines, some of which include hundreds and even thousands of different articles, is sufficient to indicate the great variety of uses to which rubber is put.

In the period 1910-20 not only was progress shown in such chemical discoveries as catalysers but the mechanics of rubber manufacture was revolutionized. For example, for many years rubber, after being cleaned by washing, was dried in airy lofts, often hanging for a year to "age." With the growth of the business came hot dryers, bringing the drying-period down to weeks and sometimes days. Eventually the vacuum dryer came into use and a few hours sufficed to extract the moisture. More than 250 fillers and compounding materials are used in rubber manufacture. Their purpose is chiefly to enhance or supplement certain qualities in which rubber may be lacking. For example, powdered asbestos in quantity makes a compound that is heat-resisting, as in packings and brake linings. Most of the above materials have been known for years. The successful use of organic plastics such as glue is of recent accomplishment, as is the preparation of elaterite in plastic form, known as mineral rubber and largely used.

The Pressure Cure.—From the time of Goodyear, rubber footwear was vulcanized by the dry heat cure, that is, in closed rooms filled with hot air. This was very slow, entailing some seven hours of heating. Furthermore, only rubber containing a considerable amount of litharge could be used for this type of cure. The colour was always black, and variety in compounding and stocks was impossible. The discovery of the pressure cure by Augustus O. Bourn, of Providence, R.I., in 1901, however, practically revolutionized the business. In this process the goods were confined in large boiler-shaped shells. These were filled with hot air under pressure and the air from the inner surfaces removed by a vacuum process, the result being that vulcanization was hastened and a great variety of tough compounds, as for example those used in tire treads, were at once available. Rubber and fibre soles are coming in again, with a far better product. This is a compound of rubber and finely shredded cotton fibre. It is superior to leather in waterproof

qualities and in wear. It finds a large market in medium-grade footwear but has not been accepted by makers of the best grades of leather shoes. To a large degree the rubber heel has also displaced leather in medium-grade footwear.

Balloon Compounds.—With the interest in pilot and dirigible balloons stimulated by the World War, came marked progress in rubber compounds used in their manufacture. Of these the most notable were cements of vastly increased tenacity; ingredients and surface coatings that remained unaffected by the sun's rays, and compounds practically impermeable to gases and inflation. As a successful application of the last-named may be cited the gas-proof masks evolved by rubber chemists, that effectually protect the wearer from poison gas and have a wide field of use in many of the perilous industries of peace. Bathing suits and bathing caps of rubber, beautiful in texture, colours and ornamentation, are recent accomplishments. This is due to the production by chemists of colours unaffected by heat and sulphur. Rubber fills a large place in sports, but most of the goods supplied have been familiar for decades. An exceptional and novel use is rubber thread in golf-ball manufacture. The standard ball was for years made of solid gutta. In 1898 Coburn Haskell of Cleveland, O., invented a golf ball with a small ball of rubber as a core around which was wound rubber thread under tension. Outside of this was moulded a thin cover of gutta percha. The ball because of its long flight soon took the place of the "guttie" and helped enormously to popularize golf.

Hard Rubber.—Electric batteries employed in motor cars for lighting and starting and for a host of commercial uses resulted in a great demand for hard-rubber battery jars. Formerly made by a slow hand process, the invention of building and moulding machines greatly added to the quality of the product and the ability to meet the trade demands. The production of hard-rubber bowling balls, better than the lignum vitae, and of aeroplane propellers, better than laminated wood, points the way to the use of hard-rubber lumber, as nearly all the fine hardwoods are successfully imitated.

RÜCKER, SIR ARTHUR (1848-1915), English physicist, was born at Clapham Oct. 23 1848. Educated at Clapham grammar school and Brasenose College, Oxford, he became professor of mathematics and physics at the Yorkshire College, Leeds, in 1874 and professor of physics at the Royal College of Science in 1886. This post he held until 1901, when he became principal of the university of London. He received the Royal medal of the Royal Society in 1891, was one of its secretaries from 1896 to 1901, and was knighted in 1902. He died at Newbury, Berks, Nov. 1 1915.

RUFFEY, PIERRE XAVIER EMMANUEL (1851-), French general, was born at Dijon (Côte d'Or) on March 19 1851. He entered the École Polytechnique in 1871 and two years later was appointed *sous-lieutenant* in the artillery. He became a lieutenant in 1875 and a captain in 1878. In 1879 he went through the staff course at the École de Guerre, to which he later returned as professor of artillery. He was promoted major in 1891, lieutenant-colonel in 1897 and colonel in 1901. He served with the expedition to Madagascar, and in 1905 was made a general of brigade. In 1910 he was promoted general of division and in 1913 he was made a commander in the Legion of Honour. On the outbreak of war in Aug. 1914 he commanded the III. Army, but a month later, after the Longwy battles, he was removed from the command of his army, being succeeded by Sarrail. Thereafter he was not employed in an active command at the front, and in Jan. 1917, having already attained the age of retirement, he ceased to hold any appointment. General Ruffey, during the last years before the World War, had persistently advocated the increased employment of heavy artillery with the field army, and it was perhaps due to him more than to any other leading personality that the French Army was able to adapt itself so readily to the use of the new arm.

RUMANIA (see 23.825).—Before 1913 Rumania had an area of about 50,702 sq. m.; and by the treaty of Bucharest (Aug. 7 1913) it received from Bulgaria an addition of 2,069 sq. m. in the Dobrudja, which formed the departments of Durostor and Caliacra. By the treaties following the World War, this area was more than doubled, the additions consisting of the Banat (11,000 sq. m.), Bessarabia (17,146 sq. m.), Bukovina (4,030 sq. m.), Crisana (8,038 sq. m.), Maramuresh (6,258 sq. m.) and Transylvania (22,312 sq. m.), making the total area of the kingdom 122,282 sq. miles. Thus during the period 1910-21 Rumania, from being slightly smaller than England, became somewhat larger than the whole British Isles. In shape Rumania is nearly circular, with a perimeter of about 1,850 miles. The Carpathians and Transylvanian Alps, which formerly separated Rumania from Austria-Hungary, run in a sickle-shaped curve from near Mt. Pietros to the Iron Gates, and almost down the centre of the country, which takes in the Transylvanian plateau and extends westwards into the Hungarian plain. Bessarabia forms a continuation of the plain of old Rumania. The territory corresponds roughly to the ancient Dacia, and the new Rumania constitutes a satisfactory ethnological unit, while its physical boundaries are, except in some parts, more defined by natural features than would appear from small-scale maps.

Population.—The Rumanian people form the great majority of the population, which was estimated in 1920 at 17½ millions, males being about 100,000 in excess. Apart from the alien elements of mediaeval or earlier origin many foreign stocks are represented in the territories which form new Rumania, and throughout the 19th century Jews driven from Poland penetrated far into the country, particularly into Moldavian towns. But no one of these heterogeneous elements numbers one-tenth of the population, and the very high rate of natural increase among the Rumanians, the common use of the Rumanian language and the wide toleration which prevails in matters of religion, all tend to unification.

The National Orthodox Church had in 1918 a membership of over 9½ millions, and the Greek Catholic, Roman Catholic and Protestant churches each nearly 1½ million. Jews numbered about 830,000, Mahomedans 44,000 and Armenians 17,000.

The chief towns are Bucharest, the capital (estimated pop. in 1919 400,000), Jassy (80,000), Galatz (60,000), Braila (60,000), Kolozsvár (60,000), Ploesci (50,000), Craiova (46,000). Kishinev, the capital of Bessarabia, has a pop. estimated at 125,000.

Government and Administration.—The Senate consisted in 1920 of 170 members, of whom 82 represented the old kingdom, 45 Transylvania, 24 Bessarabia and 19 Bukovina. The Chamber of Deputies had 347 members; old kingdom 168, Transylvania 112, Bessarabia 51 and Bukovina 16. The Constituent Assembly elected in May 1920 was charged with the adjustment of the constitutions of the old kingdom, Transylvania, Bessarabia and Bukovina. In the elections of June 1920 the returns of parties were:—People's party 215, Federal Democrats 34, Bessarabian Peasants 25, Transylvanian Nationalists 21, Socialists 19, Independent Democrats 6, others 12.

For administrative purposes Rumania is divided into 735 districts and 129 urban and 5,735 rural communes.

Education.—Education continued to make progress although a large proportion of the population was still illiterate and compulsory school attendance was difficult to enforce. There were in 1920 19,374 schools with 1,612,763 pupils. Universities were founded at Cluj (Kolozsvár) in 1919 and at Cernaúti (Czernowitz) in 1920.

Finance.—The national debt of Rumania at the outbreak of the World War amounted to 2,086,008,329 lei. This increased during the war by 2,910,012,500 lei and subsequent increases brought the total to 11,148,408,330 lei as on April 1 1920, of which 3,986,008,330 was funded and 7,162,400,000 lei unfunded debt. To this was to be added about 10,000 million lei as Rumania's share in the national debts of the states added to her territory by the various treaties of peace, and at least 5,000 million lei required for the withdrawal of Austrian kronen and Russian rubles. The deficits of the war years were largely covered by a "National" loan (1916), a "Unirea" loan (1919) and Banque Nationale loans, and a loan against Treasury Bonds. The revenue and expenditure for the financial year 1919-20 were respectively 1,148,408,330 lei and 4,127 million lei. About one-third of the revenue was obtained from indirect taxes and one-third from State monopolies and public services.

There were in 1919 notes of the National Bank of Rumania amounting to about 4,431 million lei, notes of the General Bank of Rumania (issued by the Germans) 2,172 million lei, more than 8,000 million Austrian kronen and about 1,000 million Russian rubles. When the krone and ruble are replaced by Rumanian notes the equivalent paper circulation may be taken at 11,500 million lei. The National Bank had in gold 315 million lei in Moscow, 80 million in Berlin and 98 million in the Bank of England; adding to this drafts and other interest-bearing resources abroad, the guarantee of the notes was nearly 34 %, a high percentage compared with the notes of most banks of issue in other countries.

Agriculture.—Four-fifths of the population of Rumania are engaged in agriculture. About 40 % of the land under cultivation consists of holdings under 25 ac. and 50 % of farms of 250 ac. or more. Far-reaching measures of agrarian reform were begun in 1917, and large areas had in 1921 been expropriated and transferred to the peasants. Of the 34 million acres which made up Rumania after the Peace of Bucharest in 1913 (2 millions of which consisted of rivers or lakes) about 12½ million acres were under cereals; 500,000 under pulse, vegetables and various industrial plants; 400,000 were vineyards and orchards; pastures covered nearly 3 million acres and nearly 1½ million acres were meadowland. Wheat and maize are the principal crops, the former being produced chiefly for export and the latter for home consumption. Maize is the characteristic crop of the small holder in the hill regions, while most of the wheat is produced in the larger farms in the plains. The methods of agriculture are in many parts still very backward; by the development of irrigation in the plains and the abandonment of the fallow system, production could be largely increased. Table 1 shows the area under cultivation and the production (in tons) of the principal crops in the years 1914, 1915, 1919 and 1920.

TABLE 1.

	1914		1915		1919		1920	
	Acres (thousand)	Tons (thousand)	Acres (thousand)	Tons (thousand)	Acres (thousand)	Tons (thousand)	Acres (thousand)	Tons (thousand)
Wheat . . .	5,216	1,248	4,703	2,408	2,949	1,320	2,096	630
Maize . . .	5,092	2,701	5,205	2,743	4,838	2,597	4,051	1,773
Oats . . .	1,056	367	1,064	371	594	207	971	425
Barley . . .	1,404	644	1,371	758	584	257	1,054	460
Rye . . .	208	49	188	75	218	87	184	52

The cultivation of industrial plants is little developed. The vineyards produce in good years as much as 66 million gallons of wine. Plum trees take the place of the fig tree in Mediterranean countries. The tobacco and beetroot produced barely suffice for local needs.

The number of domestic animals was greatly reduced during the war: in 1920 it was estimated that in the new Rumania there were less than 5 million cattle and 11 million sheep. The breeding of horses was again becoming important, particularly in the Banat and the Nistru (Dniester) valley.

Forests.—Rumania has nearly 19 million acres of forest, of which 6½ millions are in old Rumania, 5½ millions in Transylvania, 1½ millions in Maramuresh and 1½ millions in the Banat. A great deal of timber is required locally for building and there is a considerable export from Piatra and Galatz, but the development of the immense timber reserves had only made a beginning before the war.

Minerals.—The useful minerals occur chiefly in the hill districts; petroleum is by far the most important. The production of petroleum amounted in 1914 to over 1½ million tons, placing Rumania fourth in the list of the world's oil-fields. Oil has been chiefly obtained in the region between the Ialomitza and the Bistritza, the main wells being in the districts of Prahova, Dambovitza, Buzeu and Bacau and especially in Prahova; but there are strong indications that the fields are much more extensive. A line of three pipes from the oil-fields to Constantza, carried over the Danube by the Cernavoda bridge, was completed shortly before the war. The wells and oil refineries were wrecked by a British mission in Oct. and Nov. 1916 to prevent their falling into enemy hands, but during the occupation they were largely restored and a new pipe-line was laid through Bucharest to Giurgevo on the Danube. The production was 517,500 tons in 1917, 1,214,000 tons in 1918, and 920,000 tons in 1919. Considerable importance is attached to discoveries of natural gas, of which it was estimated in 1920 that the annual available supply is 2,500 million cubic feet.

Salt, which is a Government monopoly, is mined at Targu Ocna, Ocele Mari and Slanic.

About 4 million tons of lignite are produced annually, chiefly in the region between the Danbovitza and the Ialomitza. Small quantities of coal (less than 400,000 tons in all annually) are mined near Oravitz in the Banat. The exploitation of iron (400,000 tons annually), copper, lead and manganese has been begun. The gold mines in the Aranyos valley are the most productive in Europe.

Manufactures.—The development of manufactures in Rumania scarcely began before the 20th century. The chief industries are

petroleum refining, sugar manufacture, flour milling and saw milling. Bucharest, Braila and Galatz are the most important centres. In 1915 there were 1,149 industrial establishments employing 58,871 workmen and having invested capital of 805,472,618 lei. It has been estimated that water-power amounting to 150,000 H.P. is available, but in 1912 less than 9,000 H.P. had been brought into use.

Imports and Exports.—The total imports and exports for the years 1911–5 and 1919 are given in Table 2.

TABLE 2.

	Imports and Exports (000's omitted).					
	1911	1912	1913	1914	1915	1919
Imports . . .	£ 22,790	£ 25,516	£ 23,601	£ 19,970	£ 13,186	£ 143,318
Exports . . .	£ 27,669	£ 25,684	£ 26,828	£ 17,897	£ 22,581	£ 4,116

Before the war exports were chiefly to Belgium and Holland, and cereals formed the most important articles. In 1919 more than half the value of exports was made up by petroleum. Of imports in 1911 29 % in quantity and 15 % in value came from the United Kingdom, 25 % and 24 % respectively from Austria and 19 % and 32 % from Germany. The chief imports in 1919 were cereals and cereal by-products (220,149 tons; value 362 million lei) and manufactured articles. Exports to the United Kingdom were valued at £2,742,000 in 1919 and £3,227,000 in 1920, imports from the United Kingdom £5,385,085 in 1919 and £7,121,555 in 1920.

Communications.—Rumania had in 1913 2,586 m. of national roads, 3,066 m. of departmental roads, 22,000 m. of communal and village roads and about 7,000 m. of unmetalled tracks. The main roads are well constructed and maintained, but the communal and village roads are not well adapted for traffic and are often impassable at certain seasons.

By the Treaty of Versailles the Commission of the Danube is composed of representatives of France, Great Britain, Italy and Rumania alone. The Pruth, the only important waterway in Rumania besides the Danube, is navigable for ships of about 600 tons as far as Jassy. In 1919 Rumania had 158 merchant vessels aggregating 71,158 tons, including 17 steamers of 29,441 tons. The number of vessels entered at Rumanian ports in 1919 was 10,546, total tonnage 2,991,095 tons.

The railway system is inadequate. Four main lines of standard gauge radiate from Bucharest and a number of transverse lines cross the plains. The Carpathians are crossed at three points. There were 2,200 m. of line open in 1914 and 7,240 m. in 1920. The gauge of the Bessarabian railways differs from the others. Many new lines were in course of construction or were projected in 1921.

HISTORY, 1910–21

The Balkan War.—The war which broke out in the Balkan peninsula in 1911 as a consequence of the Italo-Turkish conflict and the Albanian risings demanded the anxious attention of the Rumanian government, now headed by J. Brătianu in place of Sturdza, whom ill-health had compelled to withdraw finally from political life. Rumania's official attitude towards the conflict of 1911 was strictly neutral, public sympathy being manifestly on the side of attacked Turkey. Towards the end of the year the Liberal ministry was obliged to resign. Rather surreptitious methods had been employed to pass a measure providing the church with a new constitution, which established a Supreme Consistory of the Protestant type, representatives of the priesthood sitting side by side with the bishops—this being the result of recent episcopal scandals of a private nature. The new convention with Austria-Hungary had sacrificed the vital interests of the Rumanian herdsmen of Transylvania, accustomed to feed their flocks and herds on the Rumanian slopes of the Carpathians and on the Wallachian plain. An endeavour had been made to regulate the internal distribution of petrol; and at the last moment the Minister of Finance, Costinescu, introduced a scheme for a progressive income tax, which was not adopted by the succeeding Liberal administration.

There were two candidates for the succession: on the one hand M. Take Jonescu, who, having left the Conservative party in consequence of a long-standing feud with the leader of its younger members, the rich landowner Nicolas Filipescu, had then formed a Conservative-Democratic party, which the longing of all classes for a new era had rendered remarkably successful at by-elections; on the other P. P. Carp, whom the death of G. Cantacuzène had placed at the head of the Conservative party. Promising a long programme of reforms, including an administrative transformation (the districts to be merged in "regions" of greater size administered by captains), it was the latter who

obtained the King's call to office. Among his colleagues were T. Maiorescu, N. Filipescu, and one of the country's foremost writers and orators, the lawyer B. St. Delavrancea.

The new Government far from satisfied the hopes of the public. The Minister of the Interior, Alexander Marghiloman, long regarded by Carp as his future successor, was chiefly preoccupied with assuring his party, despite its unpopularity, of a majority at the polls. To this end no pains were spared. Directly Parliament met, a virulent campaign was opened against the Liberals, beginning with an attack on their new economic policy (inspired chiefly by Vintilă Brătianu, brother of the leader of the party), which aimed at combining the interests of private capital with those of communal and state capital in such great transport concerns as the electric tramways of Bucharest. The Liberal opposition, numerically small, left the Chamber, and combined with Take Jonescu in a furious campaign for the overthrow of the Government. At the same time J. J. Brătianu, influenced by the Socialists, and by a Bessarabian "Poporanist" (peasant party) who had gained a high position in the party, raised the long-abandoned question of universal suffrage, and definitely pledged himself to the considerably milder policy of a single electoral college, with, moreover, only literate electors—the intention seeming rather to be that of weakening the spirit of independence of the first and second electoral colleges, whose sympathies were tending towards new formations like the National Democrats. Efforts were made at the same time to retain the votes of the rural school-teachers.

The Carp Government did something to ameliorate conditions of life for the peasantry; and N. Filipescu strove to improve the army, which had received scant attention of late years. In the matter of the Rumanian ecclesiastical schism—a quarrel between the Bishop of Roman and the Metropolitan Primate Athanasius—both protagonists were persuaded to resign and quit the field.

It was at this moment that the Balkan Confederation went to war with Turkey, whose European possessions they intended to share among themselves. Not only had no support been sought from Rumania, but certain clauses provided for the event of war with both that country and Austria-Hungary. At the outset, in Nov. the Rumanian Government professed complete unconcern with what was happening beyond the Danube. The rapid successes of the allies, however, and above all the Bulgarian victories of Kirk Kilissé and Lule Burgas, opened the eyes of neutral spectators to the danger of a new imperialism in the Balkans. From Austria-Hungary came formal proposals of military collaboration, in order to prevent the victors from realizing the expected profits of their astounding success, and General Conrad von Hotzendorff arrived at Bucharest, charged with this express mission.

But already the minds of a new generation, educated in the consciousness of a Rumanian moral unity which should necessarily produce practical results at the first great European upheaval, were totally opposed to the continuance of the policy inaugurated in 1884. After a visit from Francis Joseph himself to Bucharest in 1900, the Crown Prince Francis Ferdinand made his appearance at Sinalia, hoping to strengthen ties that were daily growing looser. The Hungarian Government, of which the Crown Prince pretended to disapprove, none the less pursued its denationalizing policy, imposing, with the full rigour of the Apponyi law, which monopolized nearly the whole of primary education with the study of Magyar, an examination in that official state language even on pupils belonging to Oriental religions or to the Greek church. The Emperor-King rejected the representations of the church of Sibiu on this subject. Political prosecutions even of women, roused public feeling among the Rumanians of Transylvania. Efforts were made, under cover of seemingly democratic intentions, to turn against the Rumanians a project of Hungarian electoral reform then in preparation; and the electoral contests of June 1910 were of unusual brutality (cf. the present writer's pamphlets: *Les Hongrois et la nationalité roumaine en 1900* and *Les dernières élections en Hongrie et les Roumains*, Vălenii-de-Munte, 1909–10). The idea of Rumanians marching shoulder to shoulder with the soldiers of

Hungary was received with almost general indignation (cf. the writer's pamphlet: *Les Roumains et le nouvel état de choses en Orient*, Valenii-de-Munte, 1912). The necessity for a policy based on the existence of 13 million Rumanians, even though they inhabited three different countries, impressed public opinion more and more; and whatever may have been the Government's first intention, it began to realize its difficulties.

In the autumn the Bulgarian minister Danev, all-powerful at that moment, visited Rumania and offered to procure Bulgarian renunciation for ever of all claims to the Dobrudja—where, indeed, Bulgarians formed but a minority of the population—and also the modification of the frontier by flattening salient angles to the advantage of Rumania. His proposals were not accepted. "Compensation" was demanded for the huge territorial gains realized by the neighbouring state; and a formidable agitation for this broke out all over the country. M. Take Ionescu, with whom after the Court of Cassation's verdict in favour of the Tramway Co. an alliance had been made in a new ministerial grouping, with Maiorescu as president of Council, went to London to promote an arrangement, but was unsuccessful. The case was submitted to the Conference of St. Petersburg, which assigned Silistra to Rumania (April).

The mere delimitation of this territory raised many difficulties; and soon after the discussions between the Bulgarians and their allies, the question presented itself anew in different conditions. At that moment Carp, supported by Filipescu, was conducting a violent campaign against the Government, which had "lowered the dignity of Rumania," of which Silistra would then be "the tomb." The Government was called upon either to resign or to declare war on Bulgaria. Maiorescu obtained a parliamentary victory in the debate on the convention of St. Petersburg. But when the Serbians were treacherously attacked by the Bulgarians, and Bulgarian schemes for a Balkan hegemony became obvious, the idea of military intervention beyond the Danube had to be accepted. Russia, whose representative at Bucharest, Tchekov, manifested Rumanian sympathies, advised in that sense, Serbia just then enjoying the support of the Russian Cabinet. In June the Rumanian army, 50,000 strong, crossed the frontier, occupying on one side the northern Dobrudja as far as Kavarna; and on the other side advancing in an irresistible rush upon Sofia by Vratsa and Hanie. The exhausted Bulgarian soldiers deserted *en masse* and the Rumanians sent them back to their homes.

As the Rumanian troops, commanded by the Crown Prince, drew near the Bulgarian capital, the Tsar Ferdinand despatched an telegram to King Charles asking for peace. Negotiations were immediately begun at Bucharest between Rumanians, Serbians, Greeks and Bulgarians. Peace was concluded in August: as regards Rumania, she obtained the territory which she had already occupied in the Dobrudja; and, furthermore, her rights of protection over the Rumanians in Macedonia were recognized. *Question of Rumanians in Macedonia.*—In that region, isolated from the national soil, all through the Middle Ages sturdy local Rumanian communities had persisted, with forms of autonomy respected by the Turkish Government. Besides the shepherds, whose flocks covered the plateaux of the Pindus (see Wace and Johnson, *The Nomads of the Balkans*, London, 1913), there was an industrious urban population of artisans and traders, who spread, moreover, into towns in other parts of the Balkan peninsula. Later the activity of these "Koutzovlaks" turned towards Austria, and their colonies advanced from Budapest, Vienna, and Trieste to London and even to Philadelphia. Meeting with the Rumanian intellectuals of Hungary they initiated a new national programme, and in 1830 revived the ancient traditions with Bucharest. The Rumania of Charles I. not only welcomed them as brothers, but created, chiefly through the agency of their leader, the Apostol Mărgărit, a complete system of Rumanian education in Macedonia, including a *lycée* at Monastir, and a commercial school at Salonika. The Porte was persuaded to differentiate the Rumanian communities of that region from the Greeks of the patriarchal organization, and from the Bulgarians of the Exarchy residing at Constantinople.

There lacked but one element, absolutely essential (granted the local conditions); namely the national bishop. He had been promised to the Rumanian faithful by the Treaty of Bucharest; but the clause had never been applied, as much through the Rumanian Government's own negligence as through the ill-will of the new Serbian and Greek masters of the situation.

Germany hailed Rumania's success as a means of retrieving through her ally that influence which the defeat of her protégés the Turks had caused her to lose in the East. As to Austria-Hungary, the imperial and royal minister at Bucharest, Prince Fürstenberg, presented a note from Count Berchtold in which the recently concluded treaty was referred to as a simple "preliminary arrangement." This conception was energetically rejected, and the scheme for a European congress to arrange Oriental affairs "definitely" was wrecked. But it did not prevent the Tsar Ferdinand from issuing to his army an order of the day in which, speaking of "spoliation," he indicated "better days of glory" as yet to come.

Rumania during the World War.—The World War was now brewing. In the month of June 1914, under the form of a pilgrimage to universities, Turkish intellectuals came to Rumania to make soundings with a view to reconciliation with Bulgaria. One month later Austria-Hungary declared war with Serbia, on the pretext of avenging the murder of the Crown Prince and his wife at Sarajevo by a Serbian. The treaty with the Triple Alliance had only just been confirmed by the minister Maiorescu. His successor, the head of the Liberal party, who had come to power with a long programme of reforms—foremost among them an agrarian law based on the expropriation of the large landowners, and an electoral law establishing universal suffrage with the exclusion of illiterates—had never shown any intention of abandoning the foreign policy identified with King Charles' views and sympathies. Vienna felt assured that the Rumanian army, long prepared to that end, would march at her orders. The King's interview with the Tsar of Russia at Constantza, though it had caused a profound sensation in the country, raising hopes of a change of orientation, had produced no diplomatic results.

Public opinion was violently hostile to the Austrian adventure. During the Bulgarian campaign the soldiers had clamoured to be led to Transylvania; the King himself had witnessed their manifestations. In face of Italy's disclaimer of her obligations under the treaty, and England's declaration of war against the Central Powers, Charles I. and his advisers were forced to adopt the compromise of an armed neutrality, which the king hoped to break on the first opportunity.

When the German march on Paris failed, Rumanian politicians had to reconsider their position. M. Take Ionescu passed from the first idea of "loyal neutrality" to that of intervention on the side of the Allies, and in this he was supported especially by the combative energy of Filipescu. The latter did not shrink from dividing his own party, opposing Marghiloman, whose traditional Junimism favoured the Central Powers; and joining hands with his former rival, he effected a fusion with Take Ionescu. Meanwhile, popular demonstrations continued against Austria-Hungary and Germany, who by means of conventions were exploiting Rumania to feed the population of the German Empire, and whose subventioned Rumanian press was generally despised, despite the assistance given it by Carp and a few of his personal friends. At the "Lemberg moment" (the invasion of Galicia by the Russians), Filipescu had vehemently demanded rupture with Austria-Hungary.

In Sept. J. J. Brătianu succeeded in obtaining a declaration from the Allies (including the much-feared Russia) that in exchange for a benevolent neutrality Rumania should have the right to occupy those Austro-Hungarian territories which belonged to her by virtue of nationality. The sudden death on Oct. 10 of King Charles, to the last irreconcilable to a change of policy, facilitated the task of those who desired it. The sufferings of the Rumanians of Transylvania, induced to serve in the army of the Emperor-King by the lie that Rumania herself had embraced the same cause, and that her soldiers were fighting in

Galicia, together with the humiliations imposed on their religious and political leaders, increased the indignation provoked from the first by the conduct of the Germans in Belgium and invaded France. Soon after the Russian retreat from the Bukovina, moreover, rumours began to spread about the man-hunts organized by Austrian gendarmes against Rumanian "traitors."

The head of the Government, knowing the inadequacy of the military preparation and the difficulty of completing it, thought best to delay yet longer. Meanwhile Count Czernin, Austro-Hungarian representative at Bucharest, spoke to the Crown Prince Ferdinand (married to Princess Marie of Edinburgh, whose sympathies were well known, and whose political attitude and charitable activities were equally admirable) about the "miserable treachery" of Rumania if she abandoned her allies (*Diplomatische Aktenstücke betreffend die Beziehungen Oesterreich-Ungarns zu Rumänien in der Zeit von 22 Juli 1914 bis 27 August 1916*, Vienna, 1916). The irresistible trend of public opinion was pointed out to him in reply. In Parliament discussion was forbidden on the burning question of relations with the belligerent powers. Troops concentrated in view of possible events were now partially demobilized. And on the side of Austria all that was done was to offer the Rumanians of Transylvania, through the Orthodox Archbishop, "a certain consideration for the wishes of our non-Magyar fellow-citizens relative to the church-schools," and "the admission of the maternal language in direct communication with the authorities," and "modifications of certain dispositions of the electoral law."

As Rumania refused to allow the passage of munitions for Turkey, whose capital was now menaced by the attack in the Bosphorus, war on Serbia began anew in 1915. The Brătianu Government, which continued negotiations about the frontiers of the Bukovina, claiming to receive back the province precisely as Austria had taken it in 1775, and also about the frontiers of the Banat, where owing to Serbian colonization in the western districts there was no decisive preponderance of Germans and Rumanians, once more managed to hold public impatience in check. Henceforward, all the Central Powers could exact from Rumania was the passing of measures necessary for provisioning their populations. Italy's declaration of war in May 1915 served to raise still higher the popular excitement, which was now clamouring for a prompt decision in the only possible sense.

But when the offensive of General Brusilov once more reached Galicia and the Bukovina, further delay was impossible, especially as now, in the month of July, the treaty assuring Rumania of the desired territorial limits had just been signed. Russia became urgent: the Rumanian Cabinet was warned that delay would cause the cancelling of the territorial engagements. Certain illusions had been cherished with regard to Bulgaria, whose Prime Minister Radomir had formerly declared in Nov. 1894 that his country was "ready to give all the guarantees which should eventually be desired that she would not attack Rumania if the latter should take part in the general war." Now, however, Russia, who undertook to unite with the Rumanian forces when they entered Transylvania, and to march in concert upon Budapest, was asked to send into the Dobrudja troops sufficient to supervise the somewhat mistrusted neighbour who had participated with such zest in the annihilation of Serbia. Without having ever made one serious proposal, the German and Austrian ministers prepared to depart the moment Rumania's declaration of war arrived at Vienna (Aug. 28 1916).

As regards the internal political situation, the Liberal Government, which had achieved the entry into war unassociated with any of the opposition parties (for Maiorescu, summoned to the palace on the eve of the declaration, had fancied he was going to be called to power in order to prevent the rupture), did not even call the Chambers together to obtain their approval of the step. The armies were swiftly crossing the mountains by all the passes, to unite and form one single front upon a diagonal line in the middle of Transylvania. The enemy's feeble forces were everywhere retreating; but Germany had soon moved in her ally's interests, and had declared war. Bulgarians armed and led by German officers now surprised at Turtucaia a badly organized

Rumanian army, forced it to capitulate, and advanced through unresisting Silistra into the Dobrudja, which despite General Averescu's sturdy defensive was soon the prey of Marshal Mackensen; while in Transylvania itself General Falkenhayn was striking a decisive blow near Sibiu-Hermannstadt.

For the Rumanians nothing was left but the tragic duty of defending, with utterly inadequate technical preparation, their Carpathian frontier. This defensive they succeeded in prolonging until the end of Nov., when, served by the spies of the Austro-Hungarian companies for the exploitation of the forests, and favoured by exceptionally mild weather, they penetrated the valley of the Jiu, and occupying Craiova proceeded towards Bucharest, whose fortifications, constructed against the Russians in 1880 by the Belgian General Brialmont, had no longer any military value. After brilliant initial success a stand was made on the Arges by advice of the French General Berthelot, but ended in defeat. The army retreated in disorder towards Moldavia to reorganize there, sheltered behind Russian troops who had at last arrived on this new theatre of war; king, ministers, and parliament were already in the ancient Moldavian capital of Jassy, where they had to remain until the end of 1918.

A counter-offensive, carefully prepared during 1917, had already begun, and in July had opened the path through Wallachia, when the Russian defection in Galicia and the subsequent push by Mackensen, who threw all the forces at his disposal upon the Sereth for an advance upon Odessa, brought upon the new Rumanian army the great disaster of Marasesti—a battle lasting ten days and ending in complete inability for further resistance. As the disintegration of the Russian army proceeded, yesterday's allies turning into pillaging bands dangerous to the whole life of the country, hostilities were perforce suspended; and eventually it became necessary to submit to the armistice imposed by the Germans on General Stcherbachev, who had assumed the chief command on the Rumanian front, passing over King Ferdinand's right to the supreme command. Rumania, nevertheless, parleyed yet another two months before entering into negotiations that could only mean the abandonment of her rights, the diminution of her pre-war territorial possessions, and the loss of her economic independence.

Agrarian and Electoral Reforms.—Ever since in Dec. 1916 the Parliament had met at Jassy and enthusiastically approved the prosecution of the war to a finish, Brătianu had shared the burden of power with Take Jonescu and his section of the Conservative party. (Filipescu had died at Bucharest before the débâcle.) The activities of the Coalition Ministry had naturally been limited to ordinary current affairs. But in April the agrarian question once more became urgent, owing in part to the reactions on the public mind of the triumph of the social revolution in Russia. (The chief of the Rumanian socialists, a Bulgarian named Rakovski, after having been kept for some time under arrest at Jassy, had managed to escape, and was now agitating with his followers against the king and the bourgeoisie.) Influenced by the Crown, the Conservatives at last accepted the radical policy of expropriation, to be applied to an area fixed at 2,000,000 hectares.

Parliament debated the project for two months, the result being a law promulgated in July 1917, which left the original proprietors 500 hectares at most for each separate estate (absentees being completely expropriated), and assigned them a compensation in State bonds, the amount not to exceed twenty times the annual value of the property. A scheme for the communal holding by village associations of the land thus obtained was rejected in favour of the traditional individual tenure. Details of the distribution were to be fixed by law; but now, under the menace of a German occupation even in Moldavia, members of parliament were dispersing. When the triumph of the Central Powers seemed certain, and the armistice foreshadowed an early peace, the leaders of the war-party were practically forced to flee the country. A number of them took refuge in Paris, where they formed a national Committee of Claims.

Reunion of Bessarabia; Peace of Bucharest; Expulsion of Occupying Forces.—Already, however, the depredation of the

Russian Bolsheviks had obliged the Rumanians of Bessarabia to form a Moldavian Republic; the ancient Rumanian spirit had quickly awakened, thanks in part to a group of young writers who had never ceased to cultivate spiritual relations with free Rumania. An attempt to form a local army having failed, appeal was made to the Rumanian troops, who had moreover an interest in defending the stores of food in Bessarabia. The union of the Principalities was celebrated in Feb. 1919 at Chishinau, capital of the province, as well as at Jassy; and on April 9 the *Sfatul Ţării* (Council of the country), formed on the model of all the other revolutionary assemblies of the former empire of the Tsars, was to proclaim the union of Bessarabia with the kingdom of Rumania. J. J. Brătianu had already resigned (Jan. 1918) in face of the equal impossibility of either organizing resistance or signing a treaty of abdication. General Averescu, charged with the negotiations because of his military prestige, went for this purpose to Bufta near Bucharest, and found in the capital a party of violent opponents of the war led by the Germanophiles Carp and Stere. Count Czernin, irreconcilable in his attitude towards the Rumanians, rejected Germany's advice, brought him by von Kuhlmann, to concentrate solely on placing Rumania in a state of economic servitude, and proceeded to carve up in fantastic fashion the mountainous frontier of the kingdom; cutting off, moreover, the Dobrudja, whose future was to be settled between the Germans and the Bulgarians, Rumania being only left access to the sea under terms to be subsequently fixed. The Danube would become an artery for Austrian and German commerce, Vienna taking foothold at Severin, and Berlin at Giurgevo by means of "purchases" of wharves and sites on long leases. The entire export of the chief products of the country was assured to the Central Powers. Their army of occupation would have to remain for years to enforce the fulfillment of provisions, unexampled in severity, imposed on the country as expiation for its "crime."

This treaty was signed by the new Marghiloman Ministry, installed in office just after the arrival of a secret mission from the Emperor Charles acquiescing in the maintenance of the Rumanian dynasty. The king had been subjected to the extreme humiliation of having to go to a Moldavian railway station to meet Count Czernin, who had come there expressly to afford himself the satisfaction of that revenge.

The Marghiloman Ministry, whose chief certainly possessed statesmanlike qualities, struggled against insurmountable difficulties through months of unexampled suffering for the exploited and humiliated country. In the occupied territory everyone was snatching greedily at the remnants of national prosperity now in process of dispersal; the unlimited issue of paper money imposed on the country by the Austro-Germans through the Banque Générale presaged financial ruin; while economic ruin was ensured by the exportation of sheep and cattle, by the cutting down of forests, and by the dismantling of factories. The population, meanwhile, was starving, reduced to famine rations, and the morals of its working-class were being perverted by revolutionary propaganda. A Parliament elected under the pressure of enemy armies—a Parliament, moreover, composed of the worst elements of political life—often succeeded in disgusting even those who had desired to have it.

This state of things lasted until the battle-front of the Central Powers had been penetrated both on the Rhine and in the Balkans. The king then called to power General Coandă, an old soldier who had already had experience in diplomacy, together with General Grigorescu, to whom was due the chief credit for the victory of Marashti, as Minister of War. This Cabinet, without reference to Parliament, decreed a law for the expropriation of landowners, in accord with liberal ideas, and on the basis of the new constitutional text (the acts had been passed by the dissolved Marghiloman Parliament, the decisions of which had been declared null and void). But no sooner had the French troops commanded by General Berthelot arrived on the Danube, than the head of the Liberal party claimed, as initiator of a measure of public opinion, a change of Government. In a few days he entered Bucharest at

the side of the king, to inaugurate an administration which only lasted one year.

Reunion of the Bukovina and of Transylvania.—The new Liberal Government had the extraordinarily difficult task of reuniting, in one political whole, provinces which had been under the domination of different alien states. Bessarabia was already incorporated in the ancient kingdom, having completely abandoned the idea of autonomy, which had at first been supported by her leaders, Inculetz, Pelivan, and Halipa. Before the King's departure from Jassy he had received a deputation which came to offer him the Bukovina with the delimitation of 1775. Menaced by a Bolshevik agitation begun at Czernowitz by demobilized soldiers, this province had in Nov. proclaimed its reunion with the mother-country, under the inspiration of the historian, Prof. Jean Nistor, and of Jean Flandon, formerly head of the National party and of the Rumanian Political Union (his rival, Aurèle, chief of the Democrats, had compromised himself by projects for a great Austria, to include Rumania). The German immigrants, the few Poles, and the Jews had given their assent; only the Ruthenians held aloof, planted out as they had been by Austria and sedulously represented by statistical artifices as being the principal nationality in the Bukovina.

In Transylvania during the war the Magyar administration had spared no pains to reduce the number and importance of the Rumanians, over 3,000,000 in numbers, and predominant especially in the rural districts. The prisons were filled with suspects; judicial murders were the order of the day; a measure was framed to expropriate in favour of alien immigrants the widows and children of soldiers killed in action. At Bucharest the Bessarabian C. Stere performed the deplorable rôle of editing a journal which advocated the candidature of the new Emperor-King Charles to the throne of Rumania (Prince Joachim of Prussia had also been suggested). Directly Vienna and Budapest repudiated the Habsburgs and their followers, as being responsible for the defeat, a great Rumanian assembly at Alba Iulia declared (Dec. 1918) that Transylvania henceforth formed part of the kingdom of the united Rumanians, but that they promised absolute national liberty to their Saxon and Magyar fellow-citizens. The Saxons gave their adhesion immediately; but the Magyar bishops, Catholic, Calvinist, and Unitarian, did not take the oath of allegiance to King Ferdinand till 1921. A Council of Direction, presided over by Jules Maniu, took the reins, established order, and gave new national forms to Transylvanian life. The greater number of non-Rumanian officials were retained; communes kept their accustomed privileges; Magyar and Saxon schools worked unmolested side by side with Rumanian institutions both old and new.

Latest Events: The Agrarian Question.—During the few months of Liberal Government the reunited country awaited in vain its definitive constitution. The reconstruction of the devastated districts had to be attended to, and difficult diplomatic negotiations had to be conducted that should result in the recognition by the Allies of the new frontiers. Those fixed by the treaty of 1916 were drawn back in places to give the Hungarians a part of the hinterland of Oradea-Mare (Nagy-Várad, Gross-Wardein), and the Serbians a good half of the Banat—they had pressed to be given also the town of Temesvar (Temesvár).

After the end of 1918 a Bolshevik Government had been in power at Budapest, Count Karolyi having resigned rather than acquiesce in the military convention which deprived Hungary of the provinces which she had conquered and held since the Middle Ages. This Government showed from the first its intention of serving the party of revenge, and of trying to restore the mediæval kingdom. An armed attack on Rumanian territory by the greater part of the Red army led, in Aug. 1919, to a Rumanian counter-offensive, which—despite the interdiction of the Allies—arrived at Budapest in a few days; and there the Rumanians remained until the appointment of Admiral Horthy as regent. This was expected to promote the same policy of revenge by preparing the return of Charles of Habsburg.

The treaties of Versailles and of St. Germain recognized as Rumanian the territories which had belonged to the Dual Mon-

archy. Austria quickly signed what regarded her; but Hungary resisted till 1921, and then expressed her ratification in terms which left no doubt as to the sentiments animating a large part of the nation. Nevertheless, Rumania now considered it right and safe to demobilize (April 1921).

The Brătianu Government had resigned in order to avoid signing a treaty which imposed on the kingdom a system of minority rights that they would have preferred to establish by their own legislation. As a matter of fact, by two successive measures full political rights had already been granted to the Jewish population, without distinction between old inhabitants and recent immigrants; so that this "question" had finally ceased to exist.

For the first time the elections were free, under supervision of the "Ministry of Generals" presided over by Arthur Vaitoianu. They resulted in a large majority for the Peasant party (whose chief was the rural school-teacher Jean Mihalachi) and the National Democrats; the Liberals now formed but a fifth part of the total number of deputies; the National party of Transylvania, the Peasant party of Bessarabia, and the National party of the Union of Bukovinians were united in their representation; a certain number of Socialists made their appearance in this first Parliament of united Rumania. The majority parties coalesced as a "*bloc parlementaire*," and in Nov. 1920 formed a democratic Government of advanced tendencies under presidency of the Transylvanian Alexander Vaida Voevod, who at once visited Paris and London and obtained the formal recognition of a Rumanian Bessarabia (this was confirmed by his successor at the Ministry of Foreign Affairs, Take Jonescu). Measures were elaborated for a definitive solution of the agrarian question (the Mihalachi scheme, leaving landowners only 100 hectares for each estate, but granting concessions to those who had farms and agricultural installations); for the reorganization of education and administration; and for remedying the shortage of housing accommodation (scheme of Dr. Lupu, Minister of the Interior). General Averescu, who in April 1917 had founded a "League of the People," demanding penalties against the abuses of the Liberals during the war, and who had developed this organization—which contained many Conservatives and some "new men"—into a party under his leadership, now came into power, thanks to the alarm aroused at Court and in society by the Bolshevik agitations. The Socialists had promised their support to the man of the moment; and soon after his advent to power (March 1920) General Averescu concluded a pact with Take Jonescu, though without admitting that statesman's "Democratic" party (entirely Conservative but for Marghiloman's "Progressists") to a share in the administration of the country.

There ensued a régime of relentless repression. The threat of a general strike provided an opportunity to try and to condemn by court-martial the leaders of the Communists, from whom the Social-Democrats had detached themselves under the leadership of the Bukovinian Grigorovici. During the elections opponents were roughly treated. Few attempts were made to check the growing corruption of the towns. Important projects of law were hung up: that concerning the distribution of land was modified until it resembled the Mihalachi scheme in regard to the quota to be expropriated (and for the remainder, simple decrees at once put in force had, as in other cases, anticipated parliamentary decision). In March 1921 the Finance Minister, Nicolas Titulescu, having reduced to order the chaos of the Treasury Bonds, introduced a bill heavily taxing new fortunes and capital in general, while relieving the peasants and the small urban proprietors. It was hoped by this means to stabilize the national finances, and to restore the Rumanian exchange, which had fallen as low as 18 centimes in Paris. (N. J.)

LITERATURE.—The revival of Rumanian literature dates back to about the middle of the 19th century, when, owing chiefly to the awakened interest in Percy's *Reliques*, the poet Alexandri published his collection of *Folk Poems*. This, together with the *Old Chronicles*, edited by Kogalniceanu, constituted a living monument of the vernacular. Their importance as an inspir-

ing and stimulating power to the new writers was fully appreciated by Titu Maiorescu, who became the leading critical spirit in Rumanian letters. Under Maiorescu's influence a group of national writers gathered round the newly founded periodical *Convorbiri Literare*. Among them were J. Creangă, who in the *Recollections of Childhood* and other tales embodied the spirit of the Moldavian peasantry; Caragiale, who, besides a realistic drama and two volumes of short stories and sketches of unsurpassed craftsmanship, showed in his comedies *The Lost Letter* and *Stormy Night* the grotesque effect resulting from a hasty introduction of Western manners into a society still stamped with an Oriental character; and above all the poet Eminescu. The last-named, who has been compared with Leopardi, was dominated by a note of profound, penetrating, overwhelming sadness, which affected all his successors, not excepting Al. Vlahutza, a poet with a strong individuality of his own. But there is another side to Eminescu, his broad conception of the Rumanian race. It was this that impressed writers of the later generation such as Prof. Jorga, who, in his *History of Rumanian Literature*, arrived at a clearer understanding of what a national literature may be. In his own weekly, *Sămănătorul*, as well as in such other periodicals as *Convorbiri Literare* under the editorship of Prof. Mehedinți, *Luceafărul* and *Viata Românească*, was first published almost all the modern writing which reflects artistically the deeper characteristics of the Rumanian people. A corner of the humble life of Banat is described in Popovici-Banatzeanu's short story, *Out in the World*; the romantic Vlach population scattered throughout the mountainous parts of Macedonia, Epirus and Thessaly is represented in Marcu Beza's volume of short stories *On the Roads* and his novel *A Life*; Transylvania has produced the poets G. Cosbuc, Octavian Goga, and Stephen Josif. To the last-named, a Transylvanian of Vlach paternity, are due the best renderings into Rumanian of Shakespeare's *Midsummer Night's Dream* and Shelley's *To a Skylark*. Barbu Delavrancea has given to the theatre an historical trilogy. Victor Eftimiu's poetic excursion into fairyland, *Siringa ye pearls!* is founded on a popular Rumanian folk tale. And among story-writers must be mentioned Bratescu-Voineshti, Dulliu Zamfirescu, and Michael Sadoveanu. A great loss to Rumanian literature was the untimely death of the poet Cerna, who in profundity ranked next to Eminescu. (M. B.)*

RUNCIMAN, WALTER (1870—), British politician, was born at South Shields Nov. 19 1870, the son of Sir Walter Runciman, 1st Bart., a Newcastle ship-owner. He was educated at Trinity College, Cambridge, and afterwards joined his father in his shipping business, being from 1896 to 1905 managing director of the Moor line of cargo steamers. In 1898 he unsuccessfully contested Gravesend in the Liberal interest, but was elected for Oldham in 1899, although he only held the seat for a year. In 1902 he stood successfully for Dewsbury, and retained this seat until 1916. In 1905 he entered Sir Henry Campbell-Bannerman's Government as parliamentary secretary to the Local Government Board. He became financial secretary to the Treasury in 1907, president of the Board of Education in 1908, and was president of the Board of Agriculture from 1911 to 1914. From 1912 to 1914 he was also Commissioner of Woods and Forests, and from 1914 to 1916 president of the Board of Trade. On the formation of Mr. Lloyd George's Ministry in 1916 he retired from the Government.

RUPPRECHT, Crown Prince of Bavaria (1869—), eldest son of King Louis III., was born May 18 1869 at Munich. In 1899 he visited India and in 1902-3 undertook a journey round the world, of which he gave some account in his *Reiseerinnerungen aus Ostasien* (1905). In 1906 he was appointed to the command of the I. Bavarian Army Corps. At the outbreak of the World War he was commander of the Bavarian troops (the VI. German Army) and led them to victory in the great battles fought in Lorraine (Aug. 20-22 1914). In the following Oct. he was placed in command on the German front in Artois and southern Flanders, and, after having been advanced to the rank of field-marshal, was entrusted in the spring of 1917 with the chief command of the Northern Group of Armies on the

western front. Prince Rupprecht's first wife, a daughter of Duke Karl Theodor of Bavaria and sister of the Queen of the Belgians, died in 1912. In 1918 he was betrothed to Princess Charlotte, afterwards Grand Duchess of Luxemburg, but at the end of the war the betrothal was annulled. Prince Rupprecht renounced his claims to the Bavarian throne at the time of his father's abdication (Nov. 1918), and in 1919 he offered to stand his trial before a Court of Justice for State Affairs, if such a court, as had been contemplated, were instituted. In a letter written in 1917, but published only in 1921 in the press, Prince Rupprecht declared his disapproval of the foreign and military policy of Germany during the World War, and expressed the well-founded opinion that it was doubtful whether the Hohenzollern dynasty would survive the war.

It may be noted that through his mother, the Archduchess Maria-Thérèse of Austria-Este, Prince Rupprecht is the descendant of the Stuarts and might, therefore, pose as the "legitimist" claimant of the British Throne.

RUSSELL, BERTRAND ARTHUR WILLIAM (1872—), English mathematician and philosopher, second son of Viscount Amberley and grandson of the 1st Earl Russell, was born at Chepstow May 28 1872. Educated at Trinity College, Cambridge, where he took a first-class both in the mathematical tripos and in the 2nd part of the moral sciences tripos, he remained at Cambridge as a lecturer, and became well known as a student of mathematical philosophy and a leading exponent of the views of the newer school of Realists. In June 1916, Mr. Russell, who had taken a strong line against the Government, and was a "conscientious objector," throughout the World War, was fined £100 and £10 costs for making statements calculated to prejudice recruiting, and, in consequence, Trinity College, Cambridge, deprived him of his lectureship. His chief published works, on which his philosophical reputation was based up to the outbreak of the World War, were *German Social Democracy* (1896); *Essay on the Foundations of Geometry* (1897); *Principles of Mathematics* (1903); *Principia Mathematica* (with A. N. Whitehead, 1910) and *Our Knowledge of the External World* (1914). Later he published *Principles of Social Reconstruction* (1917); *Mysticism and Logic* (1918); *The Analysis of Matter* (1920) and (after a visit to Russia) *The Theory and Practice of Bolshevism* (1920).

RUSSELL, GEORGE WILLIAM (1867—), Irish writer and painter (best known under his sobriquet of "Æ"), was born in Lurgan, co. Armagh, Ireland, April 20 1867, the second son of Thomas Ellas Russell. He went to Dublin with his parents in 1874, and was educated at Rathmines school. After some years spent in an accountant's office in Dublin he joined the Irish Agricultural Organization Society in 1897 and became an organizer of agricultural societies. In 1904 he became editor of the *Irish Homestead*, the organ of the agricultural coöperative movement in Ireland, a position he still held in 1921. He published his first book of verse, *Homeward: Songs by the Way*, in 1894. His second, *The Earth Breath*, was published in 1897. *Literary Ideals in Ireland*, some essays in collaboration with W. B. Yeats, W. L. Larmine and John Eglinton, appeared in 1899; and *Ideals in Ireland*, essays in collaboration with W. B. Yeats, Douglas Hyde, Standish O'Grady, D. P. Moran and Lady Gregory, appeared in 1901. *The Nuts of Knowledge*, a book of selections of his lyrics, was hand-printed in 1903. *The Divine Vision*, his third book of verse, appeared in 1904; *The Mask of Apollo*, a book of mystical tales, appeared in the same year; *New Poems* (edited, 1904); a hand-printed selection of his verse *By Still Waters* (1906); some *Irish Essays* (1906). *Deirdre*, a play in three acts, was published in 1907. *The Hero in Man*, an imaginative musing on the character of the soul, appeared in 1909; *The Renewal of Youth*, a similar meditation, in 1911. *Coöperation and Nationality* and *The Rural Community*, two pamphlets embodying coöperative ideals, were published respectively in 1912 and 1913. *Collected Poems* appeared in 1913, and *Some Thoughts on an Irish Polity*, privately printed, in 1915. *Imaginations and Revivies*, a book of prose essays, was published in 1917; *The Candle of Vision*, prose, in 1919. He was a member

of the Irish Convention called in 1917, and his *Thoughts for a Convention*, now embodied in the 1921 edition of *Imaginations and Revivies*, appeared that year. As well as those mentioned, he published from time to time pamphlets on various social and political subjects.

As a poet he ranks among the mystics, in the sense that his verse is dominated by a spiritual conception of the universe. Of the two great poets brought to light by the Irish literary revival, W. B. Yeats and "Æ," it might be said of Yeats that he coined for the world the treasure recovered by the renewed access to Gaelic sources into what was virtually a new language in poetry, and of "Æ" that he brought into Irish literature the ancient spiritual thought of the world. His gifts as a poet are reinforced by the vision of an artist, and though in verse he attained his highest expression, his paintings convey a vision of nature as intimate and delicate as in his verse.

He embodied his ideals for the coöperative movement and his thoughts for an Irish polity in *The National Being*. In this book coöperative ideals are used, in a fashion entirely novel, for the creation of a society which would be easily malleable to human impulse and yet stable. The foundations of his state do not begin in a legislature but in the parishes of the country, the social order taking precedence of the political order. He exhibits a general dread of the highly organized state, a dread which may be to some extent an Irish characteristic, and would make the pillars of his nation innumerable coöperative societies, each with the largest freedom for economic and social development, but federated together for enterprises which are too extensive for operation by a small community alone. He would like these communities to do many things which in other countries State departments are asked by socialists to undertake. His ideas on these matters had considerable effect upon the younger generation of Irishmen as well as upon the coöperative agricultural movement in Ireland, founded by Sir Horace Plunkett, and in which "Æ" had worked so many years. His *Candle of Vision* is a record of a personal psychological experience expressed in a luminous and distinguished prose. His economic writings in *The Irish Homestead* and elsewhere, his imaginative prose writings, his verse and his painting, exhibit a unity and harmony rare in one whose modes of expression are so diverse. This probably arises because all are inspired by a conception of God and man and Nature as one single yet multitudinous being, and out of this philosophical root comes the harmony of character maintained throughout in work in such varied spheres as painting, poetry, psychology, economics and politics. (S. L. M.)

RUSSELL, ISRAEL COOK (1852-1906), American geologist (see 23.862), died at Ann Arbor, Mich., May 1 1906.

RUSSELL, SIR THOMAS WALLACE, 1ST BART. (1841-1920), Irish politician, was born at Cupar, Fife, Feb. 28 1841. At the age of eighteen he went to Ireland and settled at Donaghmore, co. Tyrone, working as an assistant in a drapery shop. In 1864 he became secretary and parliamentary agent of the Irish temperance movement, and became well known as a speaker for that cause; it was largely due to his energy that the Irish Sunday Closing Act was passed in 1878. In 1885 he unsuccessfully contested Preston as a Liberal, but in the following year was elected to Parliament for S. Tyrone. The Home Rule controversy was then at its height, and Russell was one of the most determined opponents of Gladstone's measure. His valuable work for the Unionist cause led in 1895 to his appointment as parliamentary secretary to the Local Government Board, a post he held until the general election of 1900. About 1899, however, Russell's views underwent a change, and from this time he not only gave up his advocacy of the Unionist policy in Ireland, but became its unceasing and rather bitter critic. His book *Ireland and the Empire* (1901) was largely an attack on the Irish agrarian system, and he also expressed in it his distaste for the Ulster point of view in no measured terms. He became in 1902-3 a member of the Dublin Land Conference, presided over by Lord Dunraven, which ultimately led to the passing of Mr. George Wyndham's Land Purchase Act (1903). In 1907

Russell succeeded Sir Horace Plunkett as vice-president of the Irish Department of Agriculture and Technical Instruction. In 1910 he withdrew from the representation of S. Tyrone, but in the following year was elected for N. Tyrone as a Liberal and Home Ruler. He received a baronetcy in 1917 and retired from public life in 1918. He died at Terenure, co. Dublin, May 3 1920.

RUSSELL, WILLIAM CLARK (1844–1911), English author (see 23.865), died at Bath Nov. 8 1911.

RUSSIA (see 23.869).—The history of Russia in the years 1910–21 was dominated by the revolution. The connexion between the World War of 1914–8 and that crisis is evident, but even the years preceding the outbreak of the war, both at home and abroad, must be considered chiefly as leading up to the catastrophe. The decay of the bureaucratic system of government, the entanglements of the foreign policy of the empire, the spread of extreme theories among the educated classes, the misery and discontent of the common people, were manifested by striking symptoms both on great occasions and in everyday life.

The Last Years of Tsardom.—The transition from an autocratic to a constitutional régime is a difficult problem to solve under any circumstances, and it was rendered especially difficult in Russia by the lack of political education among the people, the doctrinaire fanaticism of the intellectual leaders and the short-sighted egotism of the Government. Instead of realizing the necessity of working together and supporting one another in order to avoid a revolutionary catastrophe, the traditional rulers and the reformers were intent on destroying each other. The First Duma had ended its days in a vain attempt to appeal to the country against the Imperial Government. In the face of terroristic attacks bureaucratic circles invited the support of enlightened public opinion, but they did it in a characteristic fashion. General Trepov conducted negotiations with a view to forming a Cadet Ministry, but competent observers were convinced that his ultimate object in applying to the advanced doctrinaires was to effect an unworkable coalition which would have to be given up after a short interval in favour of a military dictatorship (Isvolsky, *Memoirs*, 201F).

The Stolypin Ministry, which was actually formed in 1906, started also with a programme of coöperation between the Government and "leaders of public opinion," and it sought an agreement with the more moderate sections of Liberals, especially with the Octobrists, the supporters of a policy aiming at putting into practice the Manifesto of Oct. 30. The failure of this attempt is a fact of historical importance in so far as it showed conclusively how irreconcilable the tendencies of the Imperial bureaucracy were with the programme of Moderate Liberalism. Our survey of the period must start with a brief account of Stolypin's policy, as its failure led directly to the events of the revolution which put an end to the monarchy of the Romanovs.

Stolypin's Policy.—The protagonist of the drama in 1906–20, P. A. Stolypin, was as fine a representative of Old Russia as the governing class of the time could muster—not a great statesman nor an original thinker, but a high-minded, patriotic country gentleman endowed with the traditional courage of his class, with practical experience in Zemstvo work and provincial administration, accessible to ideas of reform, but constitutionally adverse to radical theories. When Minister of the Interior in Goremykin's Ministry he had taken part in negotiations with the "leaders of public opinion," even with Cadets like Muromtsev and Milyukov; on assuming the premiership he tried to introduce into his Cabinet Liberals like Count Heyden, A. Guchkov, N. Lvov, but he did not insist on this combination and eventually formed his Ministry on bureaucratic lines, while relying on the support of the Moderates in the Duma.

The sanguinary repression of revolutionary attempts and of agrarian revolts was taken in hand with ruthless energy, and it succeeded in driving discontent underground and in reestablishing external order, but it cast its shadow on the constructive work of Stolypin's statesmanship. After the clash with the intractable Second Duma the electoral system was altered by the Manifesto of June 3 1907.

This *comp. d'état* secured to the Government a numerical majority in the Third and in the Fourth Dumas, while at the same time it weakened the moral authority of these Assemblies and made the Moderates more susceptible to the appeals of the Lefts.

Some of the points of the complicated electoral system introduced by the Manifesto of June 3 1907 may be mentioned. The deputies were chosen by provincial electoral colleges, only the principal landowners and capitalists had the right to vote personally in these colleges, while other citizens had to exercise their right through representatives chosen at preliminary meetings. The direct franchise was conceded to persons holding land in varying quantities in the different provinces, roughly from 150 dessiatines (about 400 ac.) to 600 des. (about 1,600 ac.), or town property of the value of 15,000 rubles (about £1,500). The preliminary assemblies were constituted separately for smaller landowners, smaller householders in the towns, the clergy, factory and workshop workmen and peasants. Electors belonging to different nationalities could be divided into separate electoral groups by ministerial decree. The elections in Petrograd, Moscow, Kiev and Odessa were to be carried out by direct suffrage.

Stolypin's counter-offensive against the revolutionary movement could not be restricted to measures of police and emergency legislation: it made itself felt in the intellectual domain.

In spite of the outward pacification of the country there was no real settlement, and the flames of political passion burst out occasionally with ominous violence. The close of 1910 was marked by an increased agitation among the students—the most sensitive and audacious element of Russian society. Harrowing tales of flogging and tortures practised on political convicts in the prisons of the North and of Siberia had reached the educational centres, and a series of strikes and indignation meetings began in all the various high schools of the empire. The professors and academic authorities did all they could to put an end to these disturbances and to ensure the continuation of teaching, and the majority of the undergraduates supported them in this respect. The reactionary bureaucrats, however, with M. Kasso, the Minister of Public Instruction, at their head, decided to use these sad occurrences in order to overthrow the self-government of the universities, conceded to these institutions by the Imperial *ukaz* of Aug. 27 1905, and to curb the rebellious spirit of the students by stern centralization. Towards the end of the Christmas vacation M. Kasso and the Council of Ministers issued decrees ordering the establishment of a strict régime of official inspection, the closing of students' unions and societies with the exception of the scientific ones, and, eventually, the direct interference of the police for the maintenance of order within the universities and high schools. As a protest against these measures, strikes and obstructions broke out again in all the establishments for higher education; lectures had to be delivered in the presence of police officers, armed constables occupied the halls and corridors of academic buildings, and wholesale arrests and deportations of undergraduates took place. In Moscow the Rector (Prof. Maniulov) and his assistants declared that they could not assume responsibility for the carrying into effect of the ministerial measures, and resigned their offices, when thereupon they were deprived of their chairs; 63 professors and lecturers tendered their resignations as a mark of sympathy with their dismissed comrades. This did not disturb the minister in the least, and he promptly accepted most of the resignations, although this involved the intellectual ruin of the oldest and most famous university of Russia. The "Pride's Purge" in Moscow was followed by a number of dismissals in other educational establishments; it was obvious that some of these repressive measures had been prompted by feelings of jealousy and revenge on the part of the minister.

The unsparing scourging of the academic corporations produced the desired effect of outward submission, but it brought the feelings of hatred and humiliation among the intellectuals to the highest pitch, and the outcasts and convicts of the university "Stories" afterwards formed the principal contingent among the embittered intellectual leaders of the revolution.

Another sign of the times may be discerned in Stolypin's legislation in respect of the Zemstvos of the western provinces (Kiev, Volhynia, Podolia, Mogilev, Minsk and Vitebsk). The introduction of a measure of local self-government would have

been in itself a boon to the population of these provinces, but Stolypin made it an occasion for a renewed humiliation of the non-Russian nationalities, strongly represented in these districts. The project of the Government disfranchised the numerous Jewish population, and drove the Poles into a position of inferiority by dividing the electorate according to national colleges and establishing beforehand the preponderance of the Russian colleges by means of an artificial scheme of repartition. The unfairness and political short-sightedness of these restrictions provoked a strong opposition even in the docile Third Duma.

In the Council of the Empire a coalition between the Rights and the Lefts led to the rejection of the bill. Stolypin did not submit in the face of such an assertion of independence. He prorogued the Duma for three days (May 14-17), and in the interval obtained an Imperial decree promulgating the law as an emergency measure on the strength of Art. 87 of the Organic Laws. In consequence of this snub administered to the Legislative Assemblies, the Octobrist Centre could no longer support the Government; the leader of the Octobrists, A. Guchkov, resigned the presidency of the Duma, and votes of censure on the Government were passed in both Houses on the resumption of their sittings. Stolypin's position was made untenable by these events. His victories meant in truth the breakdown of his programme. The Premier had again to rely exclusively on the goodwill of the autocratic Tsar as against independent public opinion, and he had to strive for that goodwill in the enervating and treacherous surroundings of Court intrigue, in which obsequious chamberlains were more expert than himself. The consciousness of failure was clearly expressed in Stolypin's behaviour after the smashing of the universities and the snubbing of the Legislative Assemblies. He looked worn in July 1911, and alluded repeatedly to his approaching resignation (Prof. Pares, in the *Russian Review*, 1912).

The *coup de grâce* came from the midst of the secret police, that had become the mainstay of the Imperial system in its struggle against rebellion. One of the agents of this organization, Bogrov, inflicted a mortal wound on Stolypin at a gala performance in the Kiev Opera House on Sept. 14 1911. The hatred of oppressed nationalities and of the humiliated intellectual class had armed the hand of the assassin, a well-educated Jew.

One part of Stolypin's activity calls for special examination, his land reform, which may be considered as the immediate introduction to the social revolution of 1917.

Defects of the Emancipation.—The agrarian revolts of 1905 attracted the attention of the Government and of society to the deplorable condition of the most numerous and important social class, the peasantry. The causes of the growing impoverishment of the peasantry are to be sought primarily in the manner in which the emancipation of 1861 had been carried out. The Emancipation Act of Feb. 19 1861, liberating the peasants from personal serfdom and giving them part of the land on certain conditions, was meant at the same time to achieve two other purposes: it tried to secure the necessary number of workmen for the landowners, who had lost the gratuitous labour of their serfs, and to ensure the collection of taxes and redemption payments. Each peasant received at the emancipation a certain quantity of land from the landowner; he had to pay for it a redemption price, the amount of which was fixed by the Government: the payments had to be completed in 45 years. The plot of land which the peasants got as their share on the transaction was called the holding (*nadel*): its size varied greatly in different provinces. "Large" holdings ranged between 2½ (about 8 ac.) and 12 dess. (33 ac.), while minimum holdings corresponded to one-half of the maximum ones. The landowner's share comprised, besides his domain land, from one-third to one-half of the land formerly occupied by the peasants, on the condition that the latter should receive no less than the minimum holding. Besides these two principal types of holdings the Emancipation Act of 1861 established also the "beggarly" or "gratuitous" holding, which was to be no less than one-quarter of the maximum one. The gratuitous holding was established by free agreement between the peasants and the landowner; in this

case the peasants had to pay no redemption, while the landowner kept all the rest of his land. On the whole the quantity of land held by the peasants had been much reduced.

The following figures for the province of Saratoff may serve as illustration:—

Peasants who held		before 1861	after the emancipation
More than the "large" holding	.	48.1	5.8 per cent
From ½ to 1 of "	.	35.8	4.8 " "
Less than ½ of "	.	16.1	52.2 " "

In 1861 688,826 peasants received beggarly holdings; they held 502,383 dessiatines. In 35 provinces 921,826 souls were assigned one-half of the large holding each and held 1,530,000, or less than 2 dessiatines per soul.

The peasants' landholdings, which were already whittled down at the time of the Emancipation, were further reduced after it by the increase of the population. A Commission for the investigation of the conditions and needs of the peasants described the diminution of the peasants' holdings in the following manner: in 1860, 4.8% decrease on the average; in 1880, 3% decrease and in 1900 2.6% decrease. Besides a portion of the arable land, the peasant lost at the Emancipation the right of using the landowner's pasturage, of cutting wood in his forests and some other subsidiary rights important in peasant farming.

The redemption payments were a heavy charge on the peasant's budget. The Agricultural Commission of 1872 found that squires had to spend on taxes less than 14.5 kopeks per dess while the peasants paid more than 95.5 k. per dess. In addition the peasants had to pay the poll-tax, the amount of which was about 4r. 45k. per soul. The same Commission states that in 3 provinces the taxes and redemption payments of the former state and appanage peasants comprised 92.75% of their net income from land, the payments of former unfree peasants 198.25 per cent. Professor Yanson calculated that in the province of Novgorod the taxation of peasants who got small holdings was, in relation to the net income of their land, 275% in the case of the peasants who owned their land, and 565% in the case of those who had to pay the land redemption. This means that the peasants had to find other sources of revenue in order to satisfy the collectors of the land tax. The Government made some attempts to relieve the peasants' tax load. The salt tax was abolished in 1880, the poll-tax in 1882. But these measures could certainly not solve the financial difficulties of the peasantry. Arrears grew rapidly to enormous proportions.

The following figures show the growth of arrears from redemption payments in the province of Tambov:—

1871—5	3%
1876—80	5%
1881—5	16%
1886—90	35%
1891—5	124%
1896	151%
1897	205%
1898	244%

Driven by land hunger, the peasants farmed on lease a large part of the State's appanages and of squires' land, but this expedient cannot be considered as an effective help in the solution of the land problem. The rent paid by the peasants to the landowners was usually very high. It is important to notice that certain plots of land, the use and possession of which was an essential necessity for the whole community, for example strips bordering on watercourses, remained usually after the Emancipation in the hand of the landowner. This gave him the power to require exorbitant rent for such land and keep the peasants in permanent fear of losing these grounds, without which village life was practically impossible. This led to continual collisions. Under such conditions the backward and extensive methods of peasant cultivation proved very difficult to reform.

One of the most important defects of the peasant's landholding before the land settlement of Stolypin was the intermixture of strips in the open fields. The land of a community lay only seldom in a compact block. It was usually divided into a number

* Persons doing the normal work of a villager.

of smaller "shots" sometimes mixed up with lands of other villages and landowners. The blocks of land belonging to the same community were again subdivided into strips, which were sometimes 2 to 3 yd. broad and some hundred yards long. Each household held a certain number of strips 20-30-50, sometimes even 100-150. The strips were scattered at a great distance from the farmyard, and the driving to them entailed a considerable waste of time and work: this hampered greatly the farming arrangements of the villagers. A peasant of the province of Novgorod calculated that he and his horse had to make about 1,548 versts (a verst is about $\frac{1}{4}$ mile) every summer merely to go to and from his field situated at a distance of 3 versts from his farmyard. But some strips lay at a distance of 15-20 v. and even more. The intermixture of strips separated from each other only by narrow balks obliged the whole community to follow the same system of cultivation, which was usually the three-fields one. The very large extent of fallow land, the poor manure produced by weak, badly fed cattle, the carelessness of the holders who were not sure of keeping their land permanently—all this had the most ruinous effect on the peasants' farming. Under such conditions, hampering individual energy and initiative, the production on the peasants' holdings was very low indeed. The average value of the gross produce in 27 provinces¹ of one dessiatine of peasants' land was 8r. 90k., while the average cost of production per dess. was 5r. 22k.; so that the net produce per dess. amounted only to 3r. 77k. The productiveness of the squire's estate was 12-18% higher than that of the peasants, but if we take into consideration that a large area of landowners' land was taken on lease by the peasants, the difference in the results of cultivation would be much greater. Mr. Yermolov puts it at about 50%.

Decay of the Peasantry.—The growing impoverishment of the peasantry during the whole period which followed the Emancipation of 1861 is reflected in the following description of peasants' life under normal conditions, taken from a memoir of the Zemstvo of Tula:—

The peasant's life is hard and unsightly even in periods of comparative welfare. Generally he lives in a cottage of 8-9 yd. width and no more than 3 yd. in height. Cottages without chimneys are still very common, the smoke being let out through a hole in the roof. The roof is almost always thatched. In many provinces the walls are covered with dung for the sake of warmth. A peasant's family, sometimes a numerous one, is huddled together in a space of 20-30 sq. yards. The floor of the cottage is almost always bare soil, because lambs, calves, pigs and even cows are put in during the cold weather. Skin diseases are very common among the population. Meat, bacon, oil, butter appear on the peasant's table only on exceptional occasions, perhaps two or three times a year; his usual fare is composed of bread, porridge, kvass, cabbage and onions.

A very characteristic symptom of the decay of the peasants' farming is the reduction of the number of horses and the increase in the numbers of horseless households. A comparison of the figures of the horse statistics in 1888 and 1893-4 proves that in 31 provinces the number of horses had fallen by 10-88 per cent. The number of horseless households had increased during the same period in 23 provinces of central Russia from 21.56% to 26.85 per cent. More than 25% of the households have no horses at all; another 25% have only one horse each.

Let us now examine a peasant's normal budget as it is presented in the remarkable work of Mr. F. A. Shcherbina (edited by Prof. A. J. Chuprov). A medium budget of a peasant was balanced at 54r. 92k. The budget of a medium peasant household consisted of the following items:—

Income from:—	
Corn on his land	16 r. 20 k.
Corn on household land	1 r. 92 k.
Straw and hay	8 r. 16 k.
Gardening	2 r. 63 k.
Cattle-breeding	9 r. 99 k.
Trade or craft	8 r. 47 k.
Sundries	7 r. 26 k.
Total	55 r. 63 k.

¹ Statistics of the Taxation Department 1903.

Expenses:—

Corn	18 r. 10 k.
Food for cattle	8 r. 45 k.
Vegetables and fruit	1 r. 30 k.
Meat	3 r. 90 k.
Rent	1 r. 2 k.
Taxes	2 r. 65 k.
Sundries	20 r. 10 k.
Total	55 r. 54 k.

Assuming that 10 puds of corn per head are the minimum necessary during one year and that 7.5 puds are sufficient for fodder, Mr. Maress calculated that 70.7% of the peasant population had less than 10 puds per head, 20.4% had between 10 and 26.5 puds per head, and only 8.9% had more than 26.5 puds per head. This means that 70.7% of the farming population could not live on the income from their land and would be reduced to semi-starvation if they could not find any supplementary means of existence. No wonder the standard of living of the great mass of the people stood exceedingly low. The following figures² enable us to form a judgment as to the comparative consumption of corn in various countries; in studying them one must remember that corn was the staple food in Russia and that meat played a negligible part in the bill of fare of the people.

Average Corn Consumption and Production, per head
(in kilograms): 1909-14.

	Pro- duction	Con- sumption
Canada	1,696	1,326
United States	1,151	1,108
Hungary	651	552
Argentina	1,322	509
Germany	417	497
France	421	480
Rumania	875	420
Russia	445	381

The state of mind produced by this situation among the peasantry may be gathered from the opinions expressed by peasant deputies in the Second Duma in the course of the debates on agrarian reform. One of the members of the Right, Prince Sviatopolk Mirski, had said that the ignorant and inexperienced mass of the Russian people had to be guided by the landlords as a flock is guided by shepherds. Kiselev, a peasant belonging to the group of toil, replied:—

"I should like the whole of peasant Russia, the whole of the Russian land, to remember well these words of the noble descendant of Rurik. . . . We have had enough of that kind of thing! What we want are not shepherds, but leaders, and we know how to find them without your help. With them we shall find our way to light, to truth, to the promised land!"

Afanassiev, a non-party deputy, an ex-soldier, said, among other things:—

"In the Japanese war I led a number of mobilised soldiers through estates (of the squire). It took us forty-eight hours to reach the meeting place. The soldiers asked me: 'Where do you lead us?'—'To Japan.' 'What for?'—'To defend our country.' They replied: 'What is that country? We have been through the estates of the Lisetskys, the Besulova, the Padkopailova. . . . Where is our land? Nothing here belongs to us.'"

The same deputy said on another occasion:—

"Work, sweat and use the land! But if you do not wish to live on the land, to till it, to work on it, you have no right to own it!"

The great majority distrusted projects of expropriation based on the idea of compensating the former landowners, as likely to lead to unfair adjudications to the advantage of the squire. Some of the leaders were calculating how much should be taken outright, without any compensation; a few demanded the whole. Pianych, a socialist, exclaimed: "Throw them all off!"

Government Policy.—In order to meet this disastrous situation the Government made attempts in three directions—the increase of the size of peasants' holdings, emigration and the improvement of agricultural methods. It would be erroneous to think that the deficiency in land could be entirely removed by new distributions from the estates of the squire and the domains of the Crown. In 1906 the distribution of land among different classes of land-

² Nordman, *Peace Problems: Russian Economics*, p. 36.

owners was as follows (*La Réforme agraire en Russie, Ministère de l'Agriculture, 1912*):—

Crown land	133,038,883 dess.
Peasants' holdings	119,067,754 dess.
Land bought by communities and associations of peasants	11,142,560 dess.
Land bought by individual peasants	12,944,154 dess.
Land of the gentry	49,287,886 dess.
Land owned by other classes	22,664,493 dess.
Land owned by various institutions	6,985,893 dess.

The enormous area of the Crown lands was mainly covered by forests or situated in the northern and eastern provinces, so that it could not be used for agricultural purposes; the surface of convenient land in the hands of the Crown was only about 3,700,000 dess. The arable land owned by the Church and different ecclesiastical institutions amounted to 1,672,000 dess. (Statistics of the Holy Synod, 1800); the appanages comprised arable land of 2,000,000 dess. If we take into consideration that a large part of the landowners' land was covered also by forests, we come to estimate the surface of the arable land owned by squires at about 35,000,000 dess. (Yermolov). The sum total that could be disposed of would thus amount to 45,000,000 dess., or about 30% of the area of the peasants' holdings; divided among the villagers it would make less than one additional dessiatine per soul. The insufficiency of the land reserve becomes even more evident if we keep in mind that about 85% of the Crown's arable land, 90% of the appanage arable land, and a considerable part of the squires' land were already leased by the peasantry. Of the 7,449,228 dess. which were sold by a newly instituted Peasant Bank to the peasants from 1882 to Jan. 1 1906, village communities acquired 25.6%; peasants' associations 72%; individual householders only 2.4 per cent.

The peasants' revolt of 1905 and the new schemes of Stolypin gave an entirely new direction to the agrarian policy of the State. The Manifesto of Nov. 3 1905 suspended all redeeming payments after Jan. 1 1906. Of the surface of 2,846,620 dess., which the bank sold directly from Jan. 1 1906 to June 1 1913, peasants' communities got 5.5%, peasants' associations 14.8%, individual owners 79.7 per cent. The peasants also acquired from the landowners, with some assistance of the bank, 4,375,163 dess. It is estimated by Oganovsky that the result of the bank activity until July 1 1910 was the creation of 45 to 50 thousand separate farms and of 130-140 thousand small compact plots, the owners of which live in hamlets.

Let us turn now to the policy of the Government concerning emigration. The law of 1889 had subjected emigration to official supervision. Those were allowed to emigrate who were able to pay the expenses of the journey and of the installation of a new household, provided their departure did not harm the remaining members of the community. No Government assistance was given to the emigrants. Permission to emigrate was refused if the local authorities considered that the emigrants could find work in the old district. Those who emigrated without an official permission had to be sent back. These regulations resulted in a great reduction of the emigration movement, which was practically closed to the poorest peasants.

The events of 1905 and the new orientation of the Government brought a great change in the emigration policy. Greater facilities were granted, and Government assistance was promised by the Provisional Rules of June 6 1906. But the growth of emigration which followed the new regulations was obstructed by a complete lack of organization. The following figures give us some insight into the working of the new laws:—

	Emigrants to Asia (in thousands)	Emigrants returning from Asia (in thousands)
1906	139.1	13.7
1907	427.3	27.2
1908	664.8	45.1
1909	619.3	82.3
1910	316.2	114.9
1911	166.5	84.4

These figures prove that the emigration policy of the Government was far from successful.

We have now to consider the third branch of the Government activity, directed towards the solution of the agrarian question. The scheme for improving agricultural methods was based on a reform of the distribution of the land. In 1861 a legal confirmation of the peasants' customary commune was considered the best means to secure the return of the money advanced by the State for redemption. The statistics of landownership in 1905 showed that 23.2% of the households and 17% of the land owned by the peasants were held by private tenure; 76.8% of the farms and 82.7% of the peasants' land were in communal tenure. The right of property was attributed not to separate householders but to the whole village community, as a juridical person. In the case of communal land tenure only the farmyard belonged to households in permanent tenure; other land belonged to the whole community, and was subject to occasional redvisions. Unfree domestic servants were assigned to peasants' communities, but did not obtain holdings: they formed in this way a village proletariat.

In the reign of the Emperor Alexander III. the communal tenure, which was regulated by the Liberation Act of 1861, came to be regarded as a political safeguard, and its decay was considered to be a national danger. The law of Dec. 14 1893 made practically impossible the transition from communal to household tenure. But the growing impoverishment of the peasantry gave evidence that the existing land system ceased to be beneficial. The special conference established by an Imperial Order on Jan. 22 1902 recognized for the first time the necessity of a fundamental change in the existing land settlement of the peasants. The majority of the Conference were of the opinion that the communal tenure and the intermixture of strips were the chief causes of the alarming condition of the peasantry.

Stolypin's Land Settlement.—The agrarian disorders of 1906 gave increased importance to the problem, and proved that the settlement of it could not be postponed any longer. In the years 1906-7 the problem of land reform excited the strongest interest in governmental circles, and played a most prominent part in the programmes of different parties and in the debates of the First and the Second Dumas. Stolypin took the initiative on the part of the Government and eventually obtained the support of the Third Duma. His scheme was directed towards a political purpose, the creation of a conservative class of small peasant owners who could be counted upon to defend the existing régime. This class had to be strong and progressive from the economic point of view, as it was clear that the improvement of the peasants' condition could be attained only by more intensive farming. As was said above, some measures had been taken to enlarge the area of the peasants' holdings without violating the interests of the squires. But the greatest part of the Government activity was directed to a complete reconstruction of relations inside the village, to the creation of separate farms and to the spread of individual ownership. The Imperial *ukaz* of Nov. 9 1906, the Land law of June 14 1910, and the Agricultural law of May 29 1911 were enacted for this purpose. The leading features of Stolypin's scheme were as follow. Each householder possessed of land in a village community can demand that his land shall be constituted a plot in individual property. A simple majority of the village assembly may convert the holdings into the land owned privately. The land has to be assigned to the claimant, if possible, in a single block. The conversion of the land of the entire community can be decreed by a resolution of the village meeting passed by a simple majority of the members. All the communities where there had not been any redivision of land since 1861 were declared to have passed from communal tenure to individual or household ownership. The formation of compact plots could not be refused if it was asked for by not less than one-fifth of the householders. The Land Commissions created by the *ukaz* of March 4 1906 were entrusted with the redistribution of land under the new land settlement.

In the Duma the Right clung to the opinion which had been predominant in the time of Alexander III.; the Left entertained

the hope that the communal land tenure was to form the cradle of future collectivism. The Cadets mostly agreed with the principles of the Government scheme, but they objected to the coercive character of its methods. The majority of the House supported the Government and carried its bill through the Duma. The motives that influenced the deputies of the Duma were well expressed by the chairman of the Land Committee, S. Shidlovsky, in his speech on Oct. 23 1908:—

"Our attitude as regards the decree of Nov. 9 is in substance a favourable one, because this decree aims at the development of individual land tenure and individual land tenure is certainly the necessary condition of improved cultivation, and the latter means the solution of the agrarian problem . . . The foundation of a State ruled by law consists in a free, independent and energetic personality. Such a personality cannot exist unless you allow the common right of ownership, and no one who wishes the State to be ruled by law should oppose the spread of private property in land. Land is, after all, only a basis for the application of labour and capital, and labour is most productive when the labourer is placed in favourable conditions. In the forefront in this respect we have to place an open door for personal enterprise, free play for creative energy, security against outside interference, personal interest. . . . The avenue towards a permanent improvement in the existence of our peasants is to be found in an immediate increase of production and income from land, and this cannot be achieved without the help of outside capital. . . . A law which opens the way to personal property enables the agricultural worker to display his creative force."

It seemed as if the reform had achieved an immediate and striking success. Before Jan. 1 1913 the Commission had arranged farms on an area of 7,413,064 dess., held by 738,980 households; strips had been concentrated into blocks on an area of 4,359,537 dess., held by 585,571 households.

The following figures illustrate the first part of the Commission's work from 1907 to 1911.

Up to April 1 1911 the number of peasants who wanted to leave the commune amounted to 2,116,600, or 23 % of the whole number (9·2 millions). The movement towards enclosures was not equally popular in all the parts of the Empire. To make the process clearer we may divide the country into 5 areas: (1) South-East, (2) Agricultural Centre, (3) two Industrial Centres, round Petrograd and round Moscow, (4) South-West and West, (5) North and North-East (Oganovsky).

The following figures show the proportions of demand for compact plots in each of these provinces in proportion to 1,000 households:—

	S.E.	Agr. Cent.	Ind. Cent.	S.W. and W.	N. and N.E.	The whole country
Till Nov. 1907	2·8	0·9	0·5	5·2	0·4	1·4
Nov. 1907—						
Nov. 1919	7·9	7·2	3·7	14·6	2·7	6·7
Nov. 1908—						
May 1909	15·8	9·1	6·6	15·6	1·7	8·9
May 1909—						
Jan. 1910	6·1	5·0	4·8	7·3	2·1	4·9
Jan. 1910—						
July 1910	5·2	4·6	4·8	8·6	1·4	4·7
July 1910—						
Aug. 1910—						
April 1911	2·5	3·1	1·8	6·1	1·0	2·8

The number of demands for separate farms before April 1911 for each 1,000 households who held their land in communal tenure were:—S.E. 320·6; Agr. Cent. 236·9; Ind. Cent. 172·5; S.W. 427·3; N. and N.E. 77·9; whole country 234·9.

These figures show that the greatest number of demands for separate farms were made in the South and South-East provinces, where the most extensive agricultural methods prevailed. It appears also that after May 1909 the number of householders applying for farms diminished in a marked proportion. The area of the compact plots was generally very small: and the percentage of poor peasants who asked for enclosure was growing. Their intention in getting rid of communal ties was to sell their land.

To judge by these data, the Government scheme of creating a class of small independent farmers was not in a fair way to success. As was shown above, most of those who asked for separation held only a small plot, and belonged to the poorer peasantry. Even with Government assistance they were unable to start separate farms, as this undertaking involves in the beginning a considerable outlay of capital. Besides, the natural conditions in some parts of Russia were not favourable to separate farms or homesteads. One of the chief difficulties was the lack of water, which cannot be found at all, except in con-

nexion with considerable rivers, in very large tracts of the "black soil" area. This fact, together with the traditional leaping of the peasantry to village life, obliged the Land Commission to keep up on many occasions the village system even after the concentration of the fields.

A memoir drawn up by the conference of Old Ritualists held at Moscow on Feb. 22-25 1906 discloses the view taken by the peasantry on the question of communal land tenure. The opponents of the commune suggested that it made impossible any improvements in agricultural methods and diminished the productive power of the soil; its supporters stated that communal tenure was the only system based on justice; this consideration is characteristic of the traditional feeling among the Russian people. The Government scheme sacrificed justice for the sake of expected increased production. Stolypin himself described the new land settlement as "a stake on the strong."

The small area of the holdings of the new farmers and their economic helplessness had, however, a very unfavourable influence on the expected increase of production. A farmer who held only 8-10 dess. of land could not introduce any extensive improvements in his household in the absence of cheap credit. Stolypin recognized that "primitive methods were used by the peasantry as before." On the other hand, the rapid growth of emigration was one of the results of the new settlement.

The land settlement of 1906-10 was carried out with uncommon energy, but the social needs of the population were not satisfied. The Government was accused of having destroyed by a stroke of the pen an institution formed by centuries. The sudden change affected not only the economic conditions of the peasants' life, but the juridical relations between the members of the family were also shaken. Before the new settlement the life of the peasants was based on the participation in the common holding of all the members of the household. The new law substituted for this family tenure the individual ownership of the chief householder. All the other members of the family suddenly lost their rights in the land.

Other important inconveniences were also pointed out: the compulsory introduction of the reform, the danger of the increased competition, the buying up of the peasants' land for speculative purposes, the increased difficulties of existence in the case of the small households. The great end of the settlement—the creation of a strong, wealthy and conservative class of small landowners, was not attained. The necessity of extensive Government assistance and credit for the improvement of agriculture was felt more and more, but the financial estimates under this heading for 1911 amounted only to 4,000,000 rubles.

Altogether it may be said that Stolypin's agrarian measures could take effect only if they were accompanied by a steady policy making for agricultural education and backed by extensive credit. Even in such a case a long time would have been necessary to enable them to strike root. Their immediate consequence was rather to increase the fermentation in the villages and to excite and embitter the feelings of the villagers, who were losing faith in the village community without acquiring any other standard of economic organization. Thus the legislation of 1906-11 helped the agrarian upheaval instead of preventing it.

The Third and Fourth Dumas.—The death of Stolypin left a wide gap in the ranks of the Government, and the appointment of M. Kokovtsov, the Minister of Finance, to the premiership did not result in a rejuvenation of the bureaucratic system. The new Premier was in favour of continuity in policy; this meant that he would keep on the lines traced by Stolypin's initiative and avoid new departures as far as possible. He was a trained administrator, placed by chance at the head of the country in a time when caution and routine were certainly insufficient to meet the requirements of a critical situation. The principal achievement of the three years of Kokovtsov's rule was apparent success in the management of financial operations. The budget grew every year and reached in 1914 the enormous sum of 3 milliard rubles, and yet not only was a deficit avoided, but some 1,500 millions in gold were accumulated as a reserve fund to sustain the currency and meet possible emergency calls.

The instability of the vast structure buttressed on the chronic alcoholism of the people was duly perceived by public opinion, and a campaign was started in the Duma to put an end to this shameful and perilous situation. One of the Duma members, Chelyshiv, was the soul of this active agitation in the Legislative Assemblies and in Government circles. He succeeded in obtaining the formation of a commission to examine and report on the subject, but his abolitionist plans were obstructed by the opposition of the Finance Ministry, which did not see its way to balance the budget without the resources supplied by the monopoly of the sale of spirits.

Yet signs were not wanting that the welfare of the country was seriously threatened, in spite of the deceptive appearances of an enormous and duly balanced budget. The harvest of 1911 was so poor that in 1912 Russia was visited by a severe famine. Yet the Government refused to let voluntary organizations assist in fighting the disaster; only associations affiliated to the Red Cross or to the Zemstvos were allowed to send agents into the provinces, to collect and to distribute funds. The public works organized by bureaucratic boards were conducted in a very unsatisfactory manner: the peasants got hardly any help from them, as support was systematically directed to assist householders who owned horses and were altogether better off. Public opinion was incensed but powerless. As regards workmen in factories and workshops some progress was made in connexion with insurance against ill-health, but in other respects the employers were left very much to their own way, with the result that strikes, which had decreased considerably in number and intensity after the collapse of the revolutionary movement in 1907, began to multiply again. In 1912 2,032 cases of strikes were registered, in 1913 4,098. On many occasions the unrest was quelled by the intervention of Cossacks and soldiers. The most terrible case of the kind occurred in the gold-fields of a company largely supported by British and other foreign capital—the Lena Company: a dispute as to wages and maintenance was terminated by a fusillade in which 162 workmen were killed.

It is difficult to estimate the exact effect of this kind of administration on the peasants and workmen subjected to it, although there can be no doubt that bitter resentment was increased by the fact that it was driven underground. But indirectly the disappointment and disaffection of society left its mark in the growth of political opposition in spite of all the efforts of the Government to suppress it and to obtain outward compliance by means of artificial restrictions of the franchise and downright pressure on the electors.

The dissolution of the Third Duma on the completion of its period of five years presented an opportunity for an attempt of this kind on a large scale. The Third Duma had been led by the Octobrist party in conjunction with the moderate Right. This policy had suffered shipwreck through the absolutist bent of Stolypin's administration and the colourless leadership of Kokovtsov. In the last sessions before its dissolution the Duma assumed a frankly hostile attitude towards the Ministry and the leader of the Octobrists, A. Guchkov, pronounced thundering indictments against the "irresponsible influences" which shaped the course of politics from behind the scenes: the egregious mismanagement of the Artillery Department, presided over by the Grand Duke Serge Mikhailovich, and the scandalous influence of the Empress's protégé Rasputin, gave good grounds for these attacks. The decree of June 3 1907, which had introduced an intricate and restricted franchise, provided convenient handles for the gerrymandering of elections, and Kokovtsov's Government made full use of them in order to secure a Government majority in the Fourth Duma. Especially conspicuous was the mobilization of the parish priests by command of the Procurator of the Holy Synod, Sabler: the clergy were enjoined to exert all their influence on the peasants in order to ensure the election of deputies of the Right. The bureaucracy was so far successful in this campaign that, thanks to its pressure and to the evident breakdown of the plan of a coalition with the Government, the Octobrists were defeated in a number of districts and their leader, Guchkov, succumbed at the polls.

The party grouping may be tabulated as follows:—(1) The Right, 67; (2) Moderate Right, 38; (3) Nationalists, 55; (4) Centre (Krupensky's group), 28; (5) Octobrists, 87; (6) Progressists, 37; (7) Constitutional Democrats, 60; (8) Social Democrats, 14; (9) Polish circle, 13; (10) Mahomedans, 6; (11) No party, 20; (12) Group of Toll, 7; (13) Of unknown party allegiance, 17.

The new Duma was thus apparently more reactionary than the one which had preceded it. But public discontent and the inability of the Government to frame any effective policy of reform produced the unexpected result that a combination was brought about between the groups of the Left, the Octobrists, and even, in some cases, the Right Centre. In a general way the Duma assumed an attitude of opposition as regards the Government and the reactionary Council of the Empire. This line of policy was especially conspicuous in a long series of interpellations and resolutions of want of confidence carried against arbitrary acts of the authorities. The following interpellations may be mentioned among many: on the illegal acts of the police during a search in the house of the deputy Petrovsky; on the acquisition of the Kiev-Voronezh railway line by the State; on naphtha trusts; on the secret dealings of the Government with Baron Günsburg, the principal director of the Lena gold-field; on an illegal ordinance of the Petrograd prefect concerning the suppression of hooliganism; on a reform of the Medico-Surgical Academy of Petrograd by an illegal order of its principal; on the spending of money without warrant from the Legislature and failures in carrying out the conditions as to grants and credits, etc. And yet when a bill was passed by the Duma to establish rules as to the responsibility of civil servants, the Council of the Empire refused to sanction the most modest requirements in this respect, although even the Minister of Justice had expressed his agreement. On the other hand, the Government did not scruple to prosecute a deputy (Kusnetsov) for a speech he had made in the Duma, and the administrative department of the Council of the Empire laid down the principle that members of the Legislature were liable to prosecution in such cases.

All measures of home policy, even the most urgent ones, were regarded from the point of view of political strife. The Education Committee of the Duma, in conjunction with the Zemstvos, had worked out a plan for the provision and equipment of a sufficient number of elementary schools in order to secure universal instruction throughout the country. It was calculated that some ten million children had to be accommodated in the schools, in addition to about five million who were already enrolled for a course of three years in the schools of the towns and the Zemstvos (provinces). In order to achieve the result by 1924, the Duma proposed to develop gradually a network of schools by means of appropriations successively increased by 10,000,000 rubles a year in the course of 10 to 12 years. This scheme could not be carried out in its entirety and in a systematic form on account of obstruction from the Board of Education and from the Council of the Empire. Besides the distrust of these reactionary bodies as regards all kinds of enlightenment, they were opposed to any policy which gave precedence to secular schools over Church schools, although it could not be contested that the former were much more advanced and perfect in teaching and organization. The comprehensive law of consolidation which would have ensured a steady progress towards systematic instruction in the country was wrecked by the Council of the Empire: the "enlightened bureaucrat" Count Witte did not scruple to oppose the bill in alliance with the stalwarts of reaction, because, as he expressed it himself, it was an attempt to obtain paradise by means of child-murder, the murdered child being the Clerical school organization. Thwarted in its comprehensive policy, the Duma nevertheless proceeded on its course by occasional increase of credits for elementary education.

These constant conflicts produced a perceptible sliding towards the Left in the ranks of the Duma legislators. One of the symptoms of this process consisted in the disruption of the Octobrist party. It broke up into three small groups—the Left, hardly distinguishable from the Cadets; the Centre, which professed to devote its activity mainly to the strengthening of the Zemstvos; and the Right, which still clung to the idea of a possible alliance

with a reformed Government. The dismemberment of the Duma into a number of small party groups gave additional influence to the Cadet nucleus, which, though it counted few members in the Duma, acted under strong discipline and had a powerful press.

In one direction only the majority of the Duma was fairly in agreement with the Government, namely as regards foreign affairs and in questions concerning the interests of the dominant nationality of the Empire. In spite of certain minor disagreements between the parties of the Left and the Centre and Right, the Duma as a whole was decidedly Nationalistic. The Third Duma had bequeathed to the Fourth a definite line of policy concerning the Finland conflict: the Legislature backed the Government in its endeavours to subordinate the autonomy of the Finnish State to the superior claims of the Empire. The view that the union between the Grand Duchy and Russia was a *real* and not a *personal* one led to the assertion of the supreme jurisdiction of the Imperial Senate and of the St. Petersburg Court of Appeal over Finnish tribunals; to the passing of laws commuting the obligation of personal military service for money payments; and to the recognition of Russians dwelling in Finland as citizens of the Grand Duchy on equal terms with native Finns. Even the Cadets did not contest the general principle from which such demands were derived, although they disapproved of the raising of issues which embittered the intercourse between nationalities and led to unpleasant consequences in the shape of passive resistance and the incarceration of Finnish officials who refused to recognize the legality of the interference of Russian institutions in Finnish affairs, apart from the traditional channel of the governor-general and Senate as representing the authority of the Grand Duke.

The creation of the new province of Chelm (Kholm), separated from the provinces of Lublin and Sedlitz, envenomed another national conflict of long standing—that between Russians and Poles. The new Government was formed out of districts in which the dominant ethnographic element of the population was Little Russian and not Polish, although this population had been included for centuries within the boundaries of the Polish State and had been recognized as part of Congress Poland annexed to Russia by the Treaty of Vienna (1815). The Duma passed the law of separation without taking heed of the violent protests of Polish public opinion.

The Conflict with the Central Empires.—The Nationalistic orientation of the Third and Fourth Dumas was put to the test by the growing entanglements of foreign policy in the course of the years 1911-4. Russia had definitely joined the combination of Western Powers against the predominance of Germany, and opinion in the country fully supported this momentous change of front. The annexation of Bosnia and Herzegovina by Austria under the protection of Germany "in shining armour" was strongly resented, not only by Stolypin and Isvolsky as the official exponents of Imperial policy, but by the nation at large, the more bitterly as it was felt that Russia was not in a position to give free vent to her dissatisfaction. No wonder that in 1911, during the Agadir affair, Russia was found on the side of Kaiser William's opponents. But matters became especially serious when the Macedonian hostilities, which had been smouldering for decades, burst out into flames in 1912. The coalition between Bulgarians, Serbians and Greeks against Turkey had been rendered possible and effective by the support on which they reckoned from Russia; and O. Hartwig, the Minister Resident at Belgrade, was one of the principal agents in bringing it about. M. Sazonov, the successor of M. Isvolsky at the Foreign Office, cautious, but devoted to the great tradition of Russia's protectorate over the Balkan Christians, was intent on using to the full the favourable situation created by the union between the three Balkan States, the sympathy of Western Liberals and the temporary indecision of the Central Powers. In this he was supported by the Tsar Nicholas, who, however, made it clear to his agents that Russia would not risk an actual war.

The crushing defeat inflicted on the Turks by the Balkan allies seemed to justify completely the combination engineered by Hartwig. But the harvesting of the fruits of victory proved

a more difficult task than the actual fighting. The Central Powers had realized the menace of a permanent Balkan League to their ascendancy in the Near East. Austria vetoed any extension of Serbia towards the Adriatic. With the support of Germany she succeeded in depriving the Serbs and Montenegrins of the position they had won in Albania. Russia did not dare to back the latter's claims to the finish at the London Conference, and the Western Powers were disinclined to proceed without Russia. The eviction of the Serbs from the west proved fatal to the peace of Europe. They tried to recoup themselves in the east by demanding districts of western Macedonia which had been previously conceded to the Bulgarians. M. Sazonov tried to stop the growing animosity between the Balkan allies by offering the mediation of Russia, and Nicholas II. attempted rather late in the day to exert his personal influence on the wily Ferdinand of Bulgaria as well as on the Serbians. These attempts at conciliation proved unavailing: the Bulgarians broke away first, but were soon checkmated by a coalition between Serbia, Greece and Rumania. The Peace of Bucharest, which gave the Dobrudja to Rumania, western Macedonia to Serbia and important districts of Thrace and Macedonia to Greece, shattered all hopes of an effective Balkan League, and laid Bulgaria open to the insidious intrigues of Austria and Germany. M. Sazonov manifested clearly the ill-humour of Russia; but this powerless discontent made her diplomatic defeat still more humiliating.

All these events were watched by Russian public opinion with keen interest and warm sympathy for the cause of the Slavs. It was realized more and more clearly that the struggle did not concern merely the small States of the Balkans, but also their big neighbours; in the Duma and in the press the attitude of the Government was applauded or criticized from the point of view of national self-consciousness and imperialistic aspirations. M. Sazonov found unexpected support from M. Milyukov, the leader of the Cadets. B. Maklakov and V. Bobrinsky came forward as the spokesmen of Slavonic solidarity. No one knew exactly how much was involved in the risk of a breach with Germany, but the public at large sought a kind of compensation for the disappointments of home politics in a bold attitude in foreign affairs. In this way, when the climax in the antagonism between Austria and Serbia was reached in the assassination of the Archduke Franz Ferdinand, the Russian public was prepared to back the Government against any hostile acts of the Central Powers. The outrageous treatment of Serbia by Austria-Hungary was rightly interpreted as a provocation to the Entente, and especially to Russia. It is well known that everything was done to preserve peace, short of surrendering Serbia to an Austrian inquisition and waiting patiently till Germany should complete the mobilization which was proceeding under the guise of "precautionary measures." The only person of any weight who advised submission at any price was Count Witte. Everybody else, from the Emperor to the most humble citizen, understood that no choice was left but to fight for existence. The dynasty was granted a unique opportunity to retrieve its misdeeds and blunders by placing itself wholeheartedly at the head of a great popular movement. The Duma, usually so critical, expressed by the voice of its various leaders the unanimous resolve of the nation to withstand the common enemy with patriotic unanimity.

Russia in the World War.—In the light of subsequent events the declarations made on the outbreak of the World War assume a particular significance. The representatives of alien nationalities expressed emphatically their resolve to stand by Russia in the struggle. Goldman, a Lett, said: "Neither our nationality nor our speech nor our creed prevent the Letts and the Estonians from harbouring warm patriotic feelings towards Russia and from standing shoulder to shoulder with the great Russian people for the defence of the fatherland." Friedman, a Jew, spoke in the same strain: "We have lived and we live in particularly oppressive conditions. Nevertheless, we have always felt ourselves citizens of Russia and faithful sons of the fatherland. No power will ever be able to tear us from our mother-country Russia, from a land to which we have been tied for centuries. We come forward to the defence of this country not only to perform

a duty, but because we are attached to it." Even the Poles chimed in. Iaronsky pointed on their behalf to the tragic situation of Poland:—

"The Polish nation torn into three parts sees its sons in mutually hostile camps. In spite of that our feelings of sympathy for the Slavs weld us into one whole. This is suggested to us not only by the justice of the cause taken up by Russia, but also by political reflection. God help the Slavs led by Russia to repulse the Teutons in the same way as they were repulsed five hundred years ago by Poland and Lithuania in the battle of Grünwald. Let us hope that the blood shed by us and the terrors of a fratricidal war may lead to the reunion of the three fragments of the Polish people."

If the alien nationalities spoke in this way no wonder the Russian groups expressed their resolve to spare no effort in the struggle, and to support the Government to the utmost in the task of defending the country. Even the Group of Toil declared by Kerensky's voice that they were persuaded of the righteousness of Russia's cause and ready to sacrifice everything for the country's defence. Only from the little group of Social Democrats came threatening notes. Their spokesman dwelt on the solidarity of the proletariat all the world round, on the common guilt of all the Governments in provoking the war, on the resolve of the proletariat to bring about a speedy peace, on the hope that the present terrible catastrophe would result in the abolition of all wars. These discordant notes were lost, however, in the general display of enthusiasm.

The Tsar's Government was on the crest of a mighty popular wave; it might have steered a course towards victory and national regeneration if it had possessed the moral strength to rise to the occasion, to throw away the tawdry equipment of despotism and to concentrate the forces of the people for the momentous struggle. Events soon proved that it was not only incapable of such an effort, but that its leadership was in itself a hindrance to success at home and in the war.

At the start, however, two steps in the right direction were taken by the Government: the abrogation of the State monopoly of the sale of spirits, and the promise of autonomy to the Poles. The Gordian knot of the temperance problem was cut by Imperial decree in spite of the difficulties raised by finance experts. The beneficial influence of the measure on the morals and health of the people and of the army cannot be doubted.

The results for the Imperial Treasury were not so appalling as was predicted by timorous specialists. They can be gathered from a comparison between the budgets of two consecutive years—1914 and 1915.

	1915 Estimates	1914 Estimates and Assignments	Increase or Decrease
	Rubles	Rubles	Rubles
Ordinary revenue . . .	3,080,108,314	3,572,169,473	—492,061,159
Ordinary expenditure . .	3,078,814,461	3,309,523,517	—230,709,056
Surplus of ordinary revenue . . .	1,293,853	262,645,956	—261,352,103
Extraordinary revenue . .	9,500,000	13,400,000	—3,900,000
Extraordinary expenditure . .	155,493,953	304,045,881	—148,551,928
From free balance of Treasury . . .	—	27,999,925	—27,999,925
Deficit to be met by loan . . .	144,700,000	—	144,700,000

The proposed budget for 1915 included 502,642,000 rubles of ordinary revenue from new taxes and increases of existing taxation. The necessity for this increase of taxation arose from the reduction in the Government spirit monopoly operations and the influence of war upon revenue. In the 1914 budget the revenue from the spirit monopoly totalled 936,217,500 r. or 26.2% of the total ordinary revenue. For 1915 the estimated revenue from this source was only 144,360,000 r. or 4.7% of the total ordinary revenue, a decrease equal to 22.7% of the ordinary revenue of 1914. On the other hand account must be taken of the saving that would be effected in expenditure on the spirit monopoly. This expenditure totalled 246,787,567 r. in the 1914 estimates, but was reduced by 140,374,401 r. in the 1915 estimates. So the expected decrease in the net revenue from the spirit monopoly was about 631,000,000 rubles.

The appeal to the Poles was made in a proclamation of the commander-in-chief, Grand Duke Nicholas. The grant of autonomy was held out as a reward of coöperation against the common enemy, the Germans. It would have been better if the promise had come directly from the Tsar, and if instead of vague words something tangible had been conceded at once. As a matter of fact the high bureaucracy began at once to put obstacles in the way of any reform, and the matter never reached a further stage than that of discussions in a Government committee. The damage done by these vacillations was incalculable. Instead of enlisting the wholehearted support of Polish patriots Imperial bureaucracy drove them into a position of distrust and hostility, which became especially keen in view of the tactless and offensive behaviour of Russian authorities in Galicia, and could not be placated by occasional concession in details. This episode may serve as an example of the stupid policy followed by the Government in regard to all minor nationalities of the Empire: their enthusiastic rally was discouraged in every way, and old enmities were revived and increased at the most critical time. The case of the Jews was especially flagrant: numbers of them continued to perform their military duties faithfully and zealously, but many others took advantage of opportunities to spy and to betray their persecutors, and the round of executions and pogroms set in again with increasing force.

The Effects of Misgovernment.—In the field the old cancers of corruption and favouritism were again producing disappointment and disaster. The army did not lack excellent leaders—the chief-of-staff of the Southern command, Alexeiev, the corps commanders Ruzsky, Brusilov, Radko Dmitriev, were generals of the first rank. The officers and the common soldiers fought with the traditional tenacity and valour; no sacrifices were spared and brilliant victories were won. And yet on decisive occasions incredible things had happened. Samsonov's army was destroyed, thanks to a slackness in coöperation on the side of Samsonov's colleague, Rennenkampf, who was believed to play for his own hand. The suspicion was confirmed by a similar lapse on the part of the same commander later on at the battle of Lodz, when he failed to close the noose in which two corps of Mackensen's army had been caught. In Jan. 1915 an intelligence officer, Miassoyedov, actually sold the plans of the northern concentration to the Germans, and brought about a crushing defeat of Sivers' army. Worst of all it became clear towards the spring of 1915 that the army was insufficiently provided with munitions, aircraft, artillery and other appliances of war. The onslaught of Mackensen's and Hindenburg's Germans had to be met by soldiers many of whom had to man the trenches with sticks, in expectation that the death of comrades might give the chance of picking up rifles; batteries were forbidden to fire more than a couple of times an hour; the armies were surrounded by multitudes of "Kids"—marauders and deserters. Even in these terrible circumstances the Russians fought stubbornly, retreated step by step, and eventually, with the help of Alexeiev's strategy, succeeded in arresting the stream of the invasion on the lines of the Dvina and the Dniester. But the psychological effect of this desperate campaign was a lasting one. The common men had learned that their blood was shed without stint by a Government which had been criminally careless and inefficient. The way was opened to the insidious propaganda of revolutionary defeatists and traitors. The revolution of 1917 was prepared on the battlefields of Gorlice and Krasnostav.

The progressive elements of Russian society attempted to save the situation by a great effort. The Zemstvo and Town Unions, which had been doing wonders in hospital work and equipment, offered their services for the preparation of munitions:—

Towards the end of May 1915, at a congress of representatives of trade and industry, the discussion of technical questions was interrupted by an impassioned speech delivered by one of the leading Moscow millionaires, V. Riabushinsky, just back from the front and full of the impressions of the life and death struggle against the invaders. "The whole of Russia forms the rear of the army," he said. "We cannot busy ourselves with our everyday affairs at the present moment: every workshop, every factory must be used to break the enemy's force." It was not a question of forming this or that committee, but of sinking all differences and appealing to the

assistance of every able man, without distinction of parties, as people had done in the West in France and in England. Prince Lvov spoke in the same strain on June 5 at a meeting of delegates of the Zemstvo Union. "At this great historical juncture," he said, "what is needed is not criticism, but energetic work. We do not want to produce irritation, but a bold spirit and combined efforts. We must strive to concentrate all the forces of the land and to inspire Government and society with mutual confidence." (Vinogradoff, *Self-Government in Russia*, 116, 117).

Technical committees were created with the participation of leaders of industry, Zemstvo workers, representatives of the working class: they displayed fervid energy and achieved good results. But the main condition demanded by Riabushinsky and Lvov—mutual confidence between the people and the Government—was conspicuously absent. Subordinate officials joined in the efforts of the unions, but the central Government continued to flounder in the morass of Court intrigues and supine reaction. The worthless Minister of War, Sukhomlinov, was indeed dismissed and put on his trial; the ancient bureaucrat Goremykin had to resign the premiership; but the appointment of his successor, Stürmer, provoked a general outburst of indignation. He was known for his reactionary opinions, and had shown his mettle in helping to coerce the progressive Zemstvo of Tver. His great merit was his subservency and affected devotion to the Imperial family, especially to the Empress Alexandra Feodorovna. This obstinate and hysterical lady meddled more and more with affairs of State, particularly after the assumption of the supreme command by the Emperor. And behind her stood various favourites, chief among whom was the astute peasant Gregory Rasputin, whose exploits had made the Petrograd Court a place of scandal for the whole world. No wonder that the opening of the Duma in Feb. 1906 gave rise to manifestations very different from those which had occurred in that assembly in July 1904. The ally of Stolypin, Shidlovsky, speaking on behalf of the bloc of progressive parties, said: "The general longing of the entire country towards a situation in which the country could entertain confidence in its Government, and feel in union with it, has been traduced as an incitement to seize power. . . . The forces of the nation, bereft of unity, aim and guidance, have been spent in vain, and the great national effort has weakened under the dissolving influence of discontent and indifference." The leader of the Progressives, Efremov, addressed the ministers in the following words: "You must understand that your duty as patriots is to go, and to clear the place for a national Ministry."

The discord between the Government and the Duma found expression on many occasions in connexion with important questions of internal policy. The Duma rejected a bill as to the organization of coöperative societies because it placed them at the mercy of the administration. A strike at the Putilov works, suppressed by military force, gave rise to a heated discussion in which the Duma, while condemning the strike as "a stab in the back," expressed the desire that the legal activity of trade unions should be given free scope and that chambers of arbitration should be founded for the settlement of trade disputes. Perhaps the most significant pronouncement was made in the course of the debates on the budget of the Holy Synod. The Duma voted a resolution to the effect that it considered necessary a reform of the Church administration on the principle of the supremacy of Councils and of a wide application of local self-government. For this purpose a national Council should be convoked without delay. The reform should extend to central and to local administration, to ecclesiastical courts, especially in the matter of divorce procedure, and to the ecclesiastical schools; the parish should be developed as much as possible; bishops should not be transferred from one See to another, more particularly if the consent of the Church had not been obtained. The State should cease to look upon the clergy as a political instrument, and all circulars and orders in this sense should be revoked.

The Government seemed to take delight in ignoring and thwarting all these resolutions. Stürmer was called to one ministerial post after the other. In Feb. he was appointed Home

Secretary in succession to N. Khvostov, in July Foreign Secretary in succession to S. Sazonov, who was dismissed because he had urged the necessity of settling the Polish question in the sense of definite and real autonomy. Altogether ministerial portfolios were shuffled like cards at the bidding of the Empress. According to the winged word of Eugene Trubetskoy, ministers were following each other like "fleeing shadows." It may be sufficient to notice the advent of M. Protopopov, a convert from the ranks of the Liberal bloc to the Ministry of the Interior (Sept. 16). The dismay and indignation of the country found expression in a series of resolutions demanding the appointment of a Cabinet supported by the confidence of the people. Even conservative institutions like the Council of the Empire and the Association of the United Gentry joined in the chorus.

The Popular Leaders.—Before proceeding with the narrative of events which led up to the actual revolution, let us consider the various currents of thought and party organization of the intellectuals who were preparing for the coming conflict.

It is not necessary to dwell at any length on the Octobrists and the Cadets. The former drew their main strength from the provincial gentry and the Zemstvo institutions, the latter from the urban middle class and the liberal professions. The Octobrists pleaded for gradual development from local self-government, while the Cadets placed their hopes on the introduction of a constitutional democracy in which actual leadership would fall to the representatives of Western culture. The importance of far-reaching social and economic reforms was fully realized by the Cadets, and they were prepared to place them in the forefront of their political activity, but in spite of a recognition of the "four-tails" formula (i.e. universal, equal, direct and secret suffrage), the Cadets had no hold on the mass of the people, and relied on the selection of the educated by the uneducated.

Socially and psychologically, the leading groups of the years of upheaval were bound to come from the midst of the extreme revolutionary intellectuals, and it is to them that we have to turn our attention. Three leading currents may be distinguished in the history of revolutionary thought in Russia: militant idealism born of bitter resentment at the backward state of Russia in comparison with the West; the tendency to seek regeneration in a closer contact with the folklore of the common people; the economic materialism proclaimed by Marx and transplanted by various Russian thinkers. In theory, the views of the first group were most vividly expressed by writers like P. Lavrov and N. Mikhailovsky. The stress was laid by them on the propaganda of progressive ideas of European civilization among the intellectuals, especially among the youth, in order to form the minds of irreconcilable fighters for emancipation in all fields of human activity. Lavrov had initiated a philosophical theory (anthropologism) somewhat akin to the humanism of the modern pragmatic school; Mikhailovsky had preached "subjective" ideals with great effect as a journalist and literary critic. His violent radicalism was directed not only against the "powers that be," but also against agitation among the masses without corresponding enlightenment. He repudiated "class struggle" as a "school of bestiality," from which men issued as "live corpses with faces distorted by rage." In contrast to these "Westerners" appeared a group of writers who clung to the conception of a special aptitude of the Russian people for social brotherhood and communal economics (Zlatovratsky, Korolenko, Oganovsky, Kacharovaky): their antecedents must be sought in the romantic teaching of the Slavophiles as well as in emotional motives in sympathy with the toil and struggle of the peasantry.

In the case of active revolutionaries like Chernov, the radicalism of the Westerners was allied with the romanticism of the Populists, and in various combinations both tendencies helped to shape the views and the policy of the Social Revolutionary party. In the beginning of the 20th century one could distinguish some five groups representative of this party. The struggle with the Government in the first revolution (1905-6) welded these sets into a more compact body, the principal organ of which (the *Messenger of Revolutionary Russia*) proclaimed the necessity of a close alliance between revolutionary intellectuals,

conspiring proletarians and the struggling peasantry. As the programme of the Social Revolutionaries aimed at union between the classes in common opposition to the Government, it laid chief stress on political rights, democratic organization and the raising of the status and consciousness of the individual. Their methods of terrorism and insurrection were themselves the outcome of the heightened sense of personality and of the importance attached to energetic action and self-sacrifice.

The ways of the Social Democrats were different; they adopted Marx's teaching as a gospel and tried to develop and to apply it in every direction. Their chief exponent was for a time G. Plekhanov, a philosopher and economist who had taken up his residence abroad, in Switzerland and in Italy. He held strictly to the evolutionary construction laid down by Marx, according to which Capitalism appears as a necessary stage in the development of production and gives way to Collectivism only when the majority of the workers have been turned into wage-earning proletarians. Marx's principal disciple, Engels, had added that it would be the greatest misfortune for the working-class if it seized power before it had fully reached the stage of complete consciousness and Western organization. As a consequence of this, Plekhanov and his followers did not consider the Russian people ready for class war against the bourgeoisie, and insisted, on the contrary, on combined action with the social groups possessed of better education and greater political experience. Some Marxists went even further in the direction of compromise with the middle class and with the Government. For a time an "economic" orientation was very much the fashion; it discarded political action as untimely and hopeless, and insisted on "business" efforts for the improvement of the standard of living, increase in wages, industrial organization, better protection for the working-class, etc. The "Revisionist" movement, initiated in Germany by Brentano and Bernstein, found a wide field for application (Struve, Bulgakov, Prokopovich). Struve declared the formula of a class war to be a "myth" although he conceded it a certain value inasmuch as it helped to rouse the self-consciousness of the proletarians. Bulgakov analyzed the situation in regard to the distribution and cultivation of land, and came to the conclusion that the process of economic evolution consisted substantially in the gradual disappearance of brutal exploitation of human beings by fellow men; in industry this was effected by the concentration of production and increasing control, in agriculture by the breaking up of large estates and the strengthening of a class of prosperous husbandmen. Both movements converge in swelling the current of rising democracy.

The realities of Russian life did not prove favourable to a growth of these tendencies towards social peace. The burden of increasing taxation, the disastrous conduct of the Japanese war, the reactionary stupidity of the Government,—all contributed to revive the revolutionary spirit in the ranks of the Social Democratic party. The history of this revival may be traced from the appearance in Dec. 1900 of the *Iskra* (The Spark), a newspaper conducted by Lenin and Martov, supplemented by a monthly review *Zaria* (The Dawn) for more detailed exposition and argument. Lenin's pamphlets, *What is to be done?* (1902) and *Letter to a Comrade* (1903), express one of the leading ideas of his later activity. He pleads in them for centralized direction and decentralized responsibility, that is, for an oligarchy of leaders and strict discipline as regards the execution of their decisions by subordinate units. Democratic watchwords are set aside and efficiency of organization is demanded at all costs. This led to the disruption of the party. At the London Congress of 1903 the fateful division between "Bolsheviks" and "Mensheviks" was inaugurated, as a consequence of disagreement concerning the problem of leadership and discipline. The Bolshevik (meaning "Majority") group carried its proposals by a very narrow majority, and captured the Central Council of the party, from which they excluded entirely their opponents. The latter, who had a majority on the staff of the *Iskra*, proclaimed a boycott against Lenin and his adherents. The insignificance of the

immediate cause of the split was only apparent: in truth the division arose from fundamental opposition between the democratic orientation of Plekhanov and the oligarchical spirit represented by Lenin. The struggle was not suggested by a deep cleavage of principle among the rank and file of the party, but by disputes among its intellectual leaders.

Questions of principle arose, however, in the course of the Japanese war and the first revolution. While Plekhanov and the Mensheviks were for cooperation with the Liberals in the fight for political freedom and for a gradual introduction of social reforms, Lenin set his hopes on the hatred of the peasantry for the landlords, and preached a ruthless *Jacquerie*. In his pamphlet, *The Agrarian Programmes of Social Democracy*, he contended that orthodox Marxists had failed to grasp the peculiarities of the Russian situation inasmuch as they were still talking about a coalition of the bourgeoisie of the towns, while in Russia the moving power was to be sought in the rising of the peasant bourgeoisie against the squires. He contrasted the abstract views of the town proletariat with the intense revolutionary temper of the peasants who were "ready to fly at the throat of the landlords and to strangle them." In his view the proletariat had to supply leaders and instructors when the revolution had been set going, but he looked to the exasperated peasantry for bringing down the existing order.

It is hardly needful to point out the close connection between these literary disputes and the Zimmerwald agitation¹ of 1915-16, as well as with the eventual overthrow of the old regime in 1917. Let us note that the Congress of the Social Democratic party in 1917 sided definitely with Lenin and the Bolsheviks.

The Revolution.—The situation in the beginning of 1917 was extremely tense and abnormal. The Emperor had left the capital and taken up his residence at the army headquarters in order to see as little as possible of the ministries, the Duma, or the Court, and to lead a "simple life" among the selected retainers of the Stavka; the Empress continued to look for hypnotizing inspiration to monks and priests and interfered constantly in affairs of State in favour of reaction. Even the staunchest conservatives, like Trepov, found it impossible to remain in office under such conditions, and the field was left clear for half-insane subjects like Protopopov and bigoted courtiers like Prince N. Galitsin. The army at the front held on sullenly to its positions, but was war-weary and distrustful of its leaders;

¹ The Zimmerwald Manifesto of 1915 is full of momentous declarations. The following are some of them:—

"The war that has produced this chaos is the outcome of Imperialism, of the endeavours of capitalist classes of every nation to satisfy their greed for profit by the exploitation of human labour and the treasures of Nature. . . .

"To raise welfare to a high level was the aim announced at the beginning of the war: misery and privation, unemployment and death, underfeeding and disease are the real outcome. For decades and decades to come the cost of the war will devour the strength of the peoples, imperil the achievements of social reform, and hamper every step on the path of progress. Intellectual and moral desolation, economic disaster, political reaction—such are the blessings of this horrible struggle of nations. . . .

"In this intolerable situation we have met together, we representatives of Socialist parties, of trade unions, or of minorities of them, we Germans, French, Italians, Russians, Poles, Letts, Rumanians, Bulgarians, Swedes, Norwegians, Dutch and Swiss, we who are standing on the ground, not of national solidarity, with the exploiting class, but of the international solidarity of the workers and the class struggle. . . .

"The struggle is also the struggle for liberty, for brotherhood of nations, for Socialism. The task is to take up this fight for peace—for peace without annexations or war indemnities. Such peace is only possible when every thought of violating the rights and liberties of the nations is condemned. There must be no violent incorporation, either of wholly or partly occupied countries. No annexations, either open or masked, likewise no forced economic union, that is made still more intolerable by the suppression of political rights. The right of nations to dispose of themselves must be the immovable fundamental principle of international relations.

"Since the outbreak of the war you have put your energies, your courage, your steadfastness at the service of the ruling classes. Now, the task is to enter the lists for your own cause, for the sacred aims of Socialism, for the salvation of the oppressed nations and the enslaved classes, by means of the irreconcilable class struggle."

the spacious levy in his rear provided crowds of conscripts, who resented the separation from their households and their land, chafed under the drudgery of stupefying training and swallowed eagerly the germs of insidious propaganda. The factory workmen in the towns were deeply affected by internationalistic and socialistic ideas, while the peasants were groaning under the heavy toll of conscription and the economic demands arising from a war which they had ceased to understand. Among the intellectuals there was a widespread feeling of uneasiness as regards the coming catastrophe: some were afraid of "cutting off the branch on which they were sitting," and many realized the madness of plunging into revolution in the midst of a war for existence. But the prevailing sentiment was despair as to any improvement under the reactionary Government. Even in Court circles the notion of a revolutionary movement was spreading rapidly, although, of course, officers of the Guards did not look further than to the elimination of Nicholas II. and of his spouse by a conspiracy similar to those which had put an end to the vagaries of Peter III. and of Paul. Such facts as Milyukov's scathing denunciation of the Empress Alexandra's protégé Stürmer (Nov. 1-14 1916), and the assassination of Rasputin by some aristocrats among whom there was a Grand Duke, Dmitri Pavlovich, showed that the indignation of upper circles of society had reached a revolutionary pitch. The Allied mission, in which Lord Milner represented Great Britain, left Petrograd just in time not to witness the explosion which everybody was expecting. But the decision came from below, and not from the stormy currents on the surface.

The principal centres of political agitation were the factories of Petrograd and the queues of householders and servants lined up for hours in sleet and snow at the doors of the bakers. It seems almost ludicrous now to consider the quest of food as one of the principal causes of unrest, but people did not realize then what might result in this respect from a disruption of orderly intercourse, and ascribed the scarcity of bread and the high prices to the inefficiency of the hated Government. Already in Nov. 1916 there had been talk in Petrograd of the imminence of a general protest strike. On March 8 1917, bread riots actually broke out, and on the next day (Friday) the streets were full of a surging mob which protested against everything. On the Saturday the police fired on the mob, and on Sunday troops used their weapons. Already on that day it was clear that part of the garrison could not be depended on. The Pavlovsky regiment of Grenadier Guards, after an encounter with rioters, in which it fired on the crowd, came back to barracks in a very ugly mood; the men declared to their officers that they would not help to murder their brothers in the streets. On Monday (March 12) the military revolt broke loose. The Volhynsky and Litovsky Guards marched against the Arsenal in the Liteynaya. They were opposed by some other troops, but before long one regiment after the other joined in the revolt, and by March 14 the principal positions in the town had been occupied by the rebels. The premier regiment of the army, the Preobrazhensky Guards, marched to the Taurida Palace where the Duma was sitting and placed itself at the disposition of its president, M. Rodzianko. An Executive Committee of the Duma was formed and subsequently a Provisional Government of members of all parties except the extreme Right (Prince Lvov, Milyukov, Guchkov, Shingarev, Tereshchenko, Nekrasov, Godnev, V. Lvov, Manuilov, and Kerensky). At the same time another centre of authority was set up at the Smolny Institute, where a Council of Workmen's delegates appeared. It represented the factory workmen, artisans and various nondescript elements which had taken part in the Revolution and claimed a share in the reorganization of the country, and it was joined by representatives of the soldiers.

On March 15 Nicholas II. abdicated in favour of his brother Michael, who, however, declined to ascend the throne unless invited to do so by the will of the nation. In less than a week the mighty Imperial power of the Romanovs had been overthrown almost without bloodshed. All the commanders of the armies in the field and the governors of provinces, including the

Grand Duke Nicholas, Viceroy of the Caucasus, immediately proclaimed their support to the new Government.

Disorderly Feudalism.—People were related in their own Even statisticians and historians were carried away by the great rejoicings over the newly acquired freedom of Russia. Nothing seemed impossible to the great nation which had come to its own after centuries of bondage. And yet it was evident that a task of superhuman magnitude had to be faced. The story of the "Eisenknechtling" was repeating itself: the pupil of the magician had succeeded in calling up the waters of the deep, but did not possess the word capable of arresting them, and they rose and flooded the place, and drowned the inefficient amateur in witchcraft. The party which thought that the Revolution could be directed by propaganda and compromise. In reality the Revolution meant the overthrow of all accepted creeds, morals and habits of the people, a confusion of their entire nature in which, for a time, nothing could be relied upon—neither duty, nor honesty, nor affection. A deep resentment for its Christian spirit and stubborn patience gave vent to outbursts of bestial lust and cruelty, to hysterical moods of blind selfishness. Even those of the leaders, who had apprehensions as to the effect, consoled themselves by comparisons with the French Revolution, as if the French Revolution had to deal with cultural problems of such complexity as the Russian one, or had challenged the existence of the educated class.

The history of the Russian Revolution starts with the gradual dissolution of all fundamental institutions and notions. The first to go was the army, as it was the most tangible and irksome form of State organisation. The first act of the Soviet of Workmen was to issue an order to all army units enjoining the formation of Soldiers' Committees to watch over the behaviour of officers, to take over arms, etc. It is to be imagined what effect this order exercised on the discipline of the army. The patriotic Minister of War in the Provisional Government, A. Guchkov, strove might and main to stop the disintegration of discipline, the fraternisation with the enemy, and the cowardly desertions. He called up a legendary hero of the war, Kornilov, and placed him at the head of the Petrograd garrison. But all these efforts were of no avail in the face of the disorganization of the soldiery; the adulation of the demagogues, the propaganda of German and native Defeatists, and the regime of Soldiers' Committees was substituted for hierarchical command. In April Kornilov left for the front in disgust, and in May Guchkov resigned in despair.

Next came the turn of foreign policy. The mob, led by the Council of Workmen and Soldiers, was repeating the magic formula of "peace without annexation and indemnities." How could fidelity to the Alliance concluded in the fateful months of August 1914, how could the aspirations towards a command of the Straits or any other aims of Russian national policy be made to square with this abstract, colourless formula, devised at Zimmerwald by the enemies of European civilization?

The extremists in Russia took a perverse delight in ignoring completely the menace of German domination, and dreamed, or pretended to dream, of a rising of the German Socialists that would substitute class war for the struggle of empires. The Minister of Foreign Affairs, Milyukov, was not willing to dissociate himself from the Allies and to disregard the German danger, nor was he prepared to tear up as a scrap of paper the agreement concluded with much difficulty by Sazonov, in which the Western Powers had acknowledged the justice of Russia's claim to Constantinople and the Straits. He had to retire, because the mob did not want to go on with the war and cared nothing about the Allies or about Imperial interests of Russia, while those who pulled the strings behind the scenes kept in touch with the Germans and were bent on the destruction of historical empires in accordance with Zimmerwald policy. After stormy demonstrations Milyukov resigned.

Even worse than these ministerial changes was the displacement of the centre of gravity in the political world. The Duma was set aside by the appointment of the Provisional Government. As the Duma had been elected on a narrow and artificial

franchise, it carried no weight with the people. Its Executive Council could not find its right place by the side of the Provisional Government, and looked helplessly on the latter's efforts to assume authority. An attempt was made to summon the members of all the four Dumas to a kind of political conference, but this only led to a good many speeches without any practical results. The four Dumas in conjunction looked even more like ghosts than the fourth one by itself. This meant that a number of influential public men—Rodzianko, Shidlovsky, Shulgin, Maklakov, N. Lvov, Karaulov—vanished into oblivion, some for ever, others at the most critical moments of the incipient Revolution. The Provisional Government was left in isolation in the face of a seething mass of half-educated people, who had lost all sense of duty and all respect for authority. This would have been bad enough in itself, but the Provisional Government had to reckon not only with these heaving throngs but with a rival and energetic organization—the Soviet Workmen and Soldiers.

The resignations of Guchkov and Milyukov rendered necessary a reconstruction of the Provisional Government, and it was effected in the direction of the Left. The outstanding facts in this reconstruction were the appointments of Kerensky as Minister of War and Marine, the Social Revolutionary Chernov as Minister of Agriculture, the Social Revolutionary Skobelev as Minister of Labour. Prince Lvov was kept president of the Council, but he was not much more than a figure-head: the principal personage in the new combination was A. F. Kerensky, while the appearance of Chernov and Skobelev as members of the Government showed that the country was to be subjected to socialistic experiments of the most extreme kind. The dykes had burst and torrents of disorderly agitation were let loose on the land. The composition of the new Ministry was intended to bring some harmony in the action of the two rival centres, the Ministry and the Council of Workmen and Soldiers, to which a third element, delegated from the peasants, had been added. In practice the Government was made amenable to the direct influence of the council, whose aggressive Socialism was not tempered by any sense of responsibility. At its head stood a characteristic figure Chaidze, a Georgian Social Democrat, who hated everything that savoured of Russian national tradition. He had nothing to recommend him as a political leader except his stubborn opposition under the old regime. His election to be chairman of the Soviet, showed that the men, who were ready to discard all bonds of national honour and self-preservation for the sake of peace at any price, had the masses behind them.

The most terrible symptoms of the advancing disease was the arrival from abroad of Bolshevik leaders—Lenin coming through Germany, under the benevolent protection of the Kaiser, and Trotsky arriving from America. These men were resolved to preach the doctrine of Zimmerwald and Kienthal. Their zeal did not cool down in Russian surroundings. Riazanov demanded that deserters should be free from punishment for the sake of individual freedom. Steklov incited soldiers and citizens to kill generals suspected of counter-revolutionary designs without further inquiry. The weak spot in the armour of Russia had been discovered. A hysterical stampede began which spread rapidly from the rear to the front, and it is not a paradox to say that the Government was powerless against this organized disorganization: the Soldiers' Committees at the front acted systematically against the officers, fraternization with the enemy was encouraged by many of them, and when it came to a fight, they debated for hours whether they should obey orders or leave the line. In case of serious onslaughts on the part of the Germans and the Austrians, whole regiments gave way. The state of the army was depicted in the most mournful colours by no less a man than that great citizen-soldier of Russia General Alexiev:—

"Let us be frank: the fighting spirit of the Russian army is exhausted. But yesterday stern and powerful, it now faces the enemy in a trance of fatal inaction. A longing for peace and quiet has replaced the old ardour and loyalty to the country. Basic instincts of self-preservation are weakened. Where is the powerful authority at home which the whole State is yearning for? We are told it will come soon. But when will it come? What has become of our love

for the Mother country? Where is our patriotism? The sublime word of brotherhood is inscribed upon our banners, but it is not written in our hearts. Class antagonism is raging in our midst; whole classes who had honourably fulfilled their duty to their country are placed under suspicion. As a result a deep abyss has yawned between soldiers and officers."

In front of this disruption of moral ties the reproaches and warnings of progressive leaders who had not lost the sense of their allegiance to the Motherland did not avail, and yet among these patriots there were many who had passed their lives in prison and exile for the sake of their opinions—Plekhanov, Krapotkin, Breshkovskaya, Herman Lopotin.

Kerensky's Rule.—The most conspicuous, although by far not the most worthy representative of the "Defencists," was the favourite of the Revolution, the new Minister of War and Marine, A. F. Kerensky. None had thundered with more effect against the oppressive measures of the old regime, none could speak with such enthusiasm, of freedom, the sanctity of revolution, popular inspiration, the right of the masses, and the dawn of a new era. Unfortunately, impassioned feelings and eloquent words do not serve as substitutes for statesmanlike foresight, clearness of purpose, and strength of will. After attaining to a unique position at the head of revolutionary Russia Kerensky entangled himself in a net of contradictory measures, of ill-judged assertions of authority, and of weak-minded compromises and renunciations. With incredible levity and conceit he assumed that he could, by his personal magnetism, repair the harm which was being done to the army by the propaganda of Defeatists. He rushed from corps to corps, harangued soldiers' meetings, revelled in their applause, and believed that he had achieved wonders by his appearance at the front. Witnesses of these meetings did not fail to notice that the soldiers, after listening with some interest to the new kind of theatrical performances, did not conceal their incredulity as to results. These results were disclosed in a manner which did not admit of any doubts when the time came for testing the effects of this oratorical campaign in a struggle with the enemy.

Towards the beginning of July 1917 a general offensive movement was attempted, in the hope that the gallantry of specially formed shock battalions would kindle the fighting spirit of other troops, and that the whole line would advance and break at least the thoroughly shaken Austrian army. The first onslaught in the south-west was successful; Kornilov's shock troops pushed as far as Stanislaw (Stanisławów) in Galicia. But it was the last flickering flame in the case of an army disintegrated by defeatist propaganda. In the north the ordinary troops refused to support their comrades and looked on with irony at their desperate efforts against heavy odds. In the midst of the fighting a general débâcle began: the Russian regiments rolled back in disorderly retreat, and the only fact which prevented an immediate collapse was the extreme weakness of the enemy on the Austrian front.

The Russian nation, as represented by its army, had definitely succumbed in the great struggle. Even more terrible perhaps than the defeats at the front was the corresponding chaos in the country. A Separatist disaffection in the Ukraine seized the opportunity presented by the great catastrophe to assert claims as to an independent Government, based on the fact that the provinces on both shores of the Dnieper had for some centuries formed part of a Cossack republic and of the Polish-Lithuanian State. The fundamental unity of the Russian people, as well as the immense benefits brought by the reunion in the 17th century and the common progress in the 18th and 19th centuries, were set at naught by these people. The bulk of the Ukrainian population would not have followed them, in spite of many grievances against Petrograd rule, if it had not been for the hysterical stampede of the Revolution. As it was, people dreamt of a new heaven and a new earth in Kiev and in Poltava, as well as in Petrograd and in Moscow, only with the difference that their visions were reminiscences of Cossack prowess and licence. The representatives of the Provisional Government—the romantic socialist Tseretelli, the wealthy amateur Tereshchenko, the shifty intriguer Nekrasov—were not able to make any stand

against such treasonable pretensions, and conceded an autonomy bordering on complete separation. Some of the Cadet members of the Provisional Government—Prince Lvov, and Shingarev—protested and resigned, but their withdrawal was hardly noticed. Kerensky was placed definitely at the head of the Government and continued his campaign of eloquent appeals.

In the general confusion the group of relentless realists, the Bolsheviks—thought the moment opportune to show their hand. On July 24 a military revolt broke out in Petrograd: regiments converted by the extremists—the first machine-gun regiment at their head—seized strategic points in the capital; cruisers and destroyers flying the black and red flag of terrorist Revolution came into the Neva from Kronstadt. For three days it seemed doubtful whether the Provisional Government would be able to hold its own. The attempt was, however, somewhat premature. Part of the Petrograd garrison remained passive, and this made it possible for some loyal troops to suppress the rebellion. The Government was afraid, however, to strike hard: Trotaky, Lunacharsky and Kamenev were let out after a brief arrest; Lenin had disappeared as soon as it became evident that the outbreak had miscarried. Apart from the usual irresolution of ministers who had not learnt to govern during their long apprenticeship in the ranks of a critical Opposition, the hands of the Executive power were tied by the pressure from the Soviet of Workmen, Peasants and Soldiers. The Social Revolutionaries and Social Democrats, although disagreeing with the Bolsheviks and afraid of them, worshipped the word "Revolution," and were loth to adopt coercive measures against their comrades of the extreme Left. Stern measures against the extremists might have seemed a return to the oppression of the Tsarist regime, and the Socialists preferred risking their own safety to the danger of being accused of the crime of "*lese-Revolution*."

So the see-saw of contradictory decrees and measures continued for some time. While the military chiefs addressed passionate appeals to the Government for a restoration of discipline, for stern punishment of deserters, for abolition of the political authority of the Army Committee, Socialists, even moderate ones, defended the "new discipline" of the noble revolutionary army, minimized its defeats and demoralization, and consoled themselves with the prospect of a rebirth of the nation under the mighty influence of the revolutionary spirit. In the meantime, the peasants were grabbing the estates and the live stock of the squires, burning houses, and killing some of the unpopular owners. The Minister of Agriculture, Chernov, looked upon this lawlessness of self-help as a perfectly natural outbreak of the policy of expropriation. The factory workers and workshop artisans in the towns were not less insistent in the assertion of their rights; wages went up by leaps and bounds, while the work done became more and more careless and casual. Owners and engineers were sometimes thrown out of their establishments, seized by the proletarians. It happened, indeed, that after trying their hand at management for some time the workmen requested or compelled their former employers to return as managers, but such isolated cases did not counterbalance the general effect of disorder and slackness. The decay of Russian industries was proceeding fast. The efforts of military chiefs and responsible leaders to arrest the spread of treason, disorganization, and demoralization were denounced by the Socialists of the Soviet and their representatives in the Provisional Government as counter-revolutionary attempts.

The Second Revolution.—Prince Lvov recognized that it was no longer possible for Liberals to work with Chernov and his companions. He resigned from the premiership, and the Cadets in the Ministry followed him. Kerensky became prime minister. Although he retained the portfolio of War and Marine, he set himself the task of constructing a "strong revolutionary" Government. In order to find a basis for a national coalition he called a conference in Moscow, in which all classes, groups and principal institutions of the Russian State were to be represented. The Bolsheviks refused to take part and ridiculed the idea of a congregation of that kind. On Aug. 26 about 2,000

delegates met in the Grand Theatre, representatives of the various parties, of Zemstvos and municipalities, of universities, of army, of factory workmen, of peasant communities, etc. The meeting might have been a first step towards the regeneration of Russia, if the leaders had clearly realized that the danger did not lie in counter-revolution but in disorganization. But Kerensky opened the discussion by a speech in which warnings as to the danger to the country were intermixed with the usual revolutionary catchwords, and no lead was given in the direction of any practical reform. Kornilov, as commander-in-chief, delegates of the officers, and many of the former political leaders, spoke strongly of the necessity of reestablishing discipline, of a strong executive, of national work to be carried on by all parties and classes. But the delegates of the Left, who were in the majority, not only turned a deaf ear to all such exhortations, but manifested openly their contempt and dislike for the old ideals of patriotism. Among the worst were the soldiers delegated by various army committees. The whole attempt was a failure; instead of bracing up the political consciousness of the nation it revealed a state of complete paralysis on the part of the so-called rulers of the country.

At the beginning of September Riga fell, after a half-hearted and disconnected defence by the XI. Army. In the Soviet, Tseretelli tried to bring through the reintroduction of capital punishment for treason and desertion, and although he succeeded in collecting a narrow majority, this measure, insisted upon by the officers, was nullified by motions in the opposite direction—for example, by a demand that the arrested Bolsheviks should be liberated. It was evident that no serious effort to arrest anarchistic effervescence could be expected either from the Provisional Government or from the Soviet: they felt spellbound as soon as the sacred word "Revolution" was pronounced by the enemies of the State. The commander-in-chief, Kornilov, was not the man to submit meekly and without a struggle to the fatal policy of drift. He threw his authority into the scales against social disorder, and tried to force the Provisional Government to side with him. With this object in view he ordered some cavalry divisions on which he could rely to march toward Petrograd. He began negotiations with Kerensky through the medium of Boris Savinkov, a Social Revolutionary and active terrorist, who was acting as Assistant Minister of War at the time. This is how Savinkov related the main occurrences of this momentous crisis:—

"When, on the 5th-6th of September, at Headquarters I again told him that in the near future the Provisional Government would examine the bill which was being prepared by the order of the Prime Minister, for the measures to be taken at the base, he believed that the Government was no longer hesitating, and when bidding me farewell on the 6th of September at Headquarters he declared that he would give full support to the Prime Minister, for the good of the country. On my return to Petrograd I reported my conversations with General Kornilov to the Prime Minister, and on the evening of the 8th of Sept. the bill for legalizing measures at the base (i.e. severe penalties for breaches of discipline) was to have been examined by the Provisional Government. But on the 8th of Sept. I was summoned to the Winter Palace, and the Prime Minister told me something that was a complete surprise to me. He told me that V. N. Lvov had come to him with an ultimatum from Gen. Kornilov, who demanded that the supreme authority should be given over to the Commander-in-Chief, with all military and civil power over the country, and that he, the Commander-in-Chief, was to form a Cabinet in which I was to be Minister of War and the Prime Minister was to be Minister of Justice. The ultimatum was in writing, but was signed, not by Gen. Kornilov, but by V. N. Lvov himself. Then the Premier called Kornilov up on the Hughes apparatus, and asked him without reading out to him the text of the declaration signed by V. N. Lvov—whether he was ready to sign the ultimatum presented by V. N. Lvov. Gen. Kornilov replied, 'Yes, I am ready to sign.' On the same day (8th of Sept.), the Prime Minister sent a telegram to Gen. Kornilov at Headquarters, demanding that Kornilov should immediately give up his post and leave the army." (Tyzkova-Williams, 214, 215.)

Kornilov's attempt to assume power was obviously conducted in a very clumsy manner: he was not a statesman, but a soldier, and the people around him were in no way able to make up for his deficiencies in political training. It is almost inconceivable how he could have chosen as his messenger the half-witted

V. Lvov. But, apart from that blunder, the chief advisers of Kornilov, were Zavoiko, a minor bureaucrat of the old regime, crafty and plausible, but devoid of insight and authority, and Aladine, a noisy half-educated demagogue, a member of the First Duma, who had turned Nationalist and had nothing to recommend him but his posing as the mouthpiece of the secret diplomacy of the Entente. However this may be, the intended *coup d'état* miscarried completely and made the situation only worse. Kerensky assumed the part of a heroic defender of the Revolution against a military conspiracy, all the various Socialist groups joined him in the outcry against the would-be dictator, the army did not rise to support the general, who wanted to reestablish discipline and unity of command, the leader of the cavalry corps, which had advanced to the outskirts of Petrograd, shot himself, and Kornilov and his principal supporters—Danikine and Lukomsky—were arrested and charged with treason. The outcome of the whole affair was a recrudescence of revolutionary zeal, and a violent rush to the Left. In the country the panic produced by Kornilov's attempt expressed itself in wholesale massacres.

The victorious Kerensky did not realize that he had thrown away the last chance of salvation from the rising tide of anarchy and terrorism. He appointed himself commander-in-chief and imagined that he was strong enough to defeat the onslaught from the Left as well as from the Right. Yet he received warning after warning of the crumbling away of political organization. The central executive of the Soviet had been effected by the landslide towards the Left. They called a Democratic Conference in Petrograd from which all bourgeois elements were excluded: the membership was restricted to delegations from Soviets, trade unions, coöperative societies and peasants' communes. This Assembly, in which the various Socialist groups had entirely their own way, could not even agree on a resolution calling for a Coalition Government capable of defending Russia in the hour of supreme danger. A motion in the sense was first passed and then rejected in consequence of the reluctance to admit Cadets and adherents of Kornilov to any share in the Government.

In contrast with this confusion of ideas and lack of resolution the extremists were quite clear in their minds, and the snake of Bolshevism was lifting its head again. Trotsky, who had been let out of prison, was more popular than ever, when he discoursed on the necessity of forming a Government of the Soviets and appealing for peace to the proletarian masses of the world. At the new elections to the Executive of the Soviets of Workmen, Peasants and Soldiers, he was elected President against Chaidze. This meant that the dualistic system was recognized to be obsolete, and the Provisional Government with Kerensky at its head was to be discarded in favour of a concentration of power in the hands of the Extremists. A motion condemning Kerensky and his Government was passed by the Soviet Executive.

Kerensky tried to parry the blows by supplementing a tottering Coalition Ministry with a Council of the Republic composed of representatives of all the political parties, principal associations and institutions. This body met at Petrograd on Oct. 20. It gave a measure of its capacity for political action by starting a long discussion on the question of the active or passive defence of Russia against the ever-increasing German menace. Although the Bolsheviks ostentatiously left the Council as a protest against the presence of "bourgeois" elements and the "counter-revolutionary" policy of the Council, the remaining parties were unable to agree on any definite and patriotic motion. The Internationalist delusions of many Socialists were strong enough to prevent any firm declaration directed against the Germans. Five motions were made, and all five were rejected one after the other. Defencists like Plekhanov were powerless against the Internationalists led by Martov.

The Bolshevik Usurpation.—The time of the Bolsheviks had come. In the first days of Nov. 1917 the Soviet under Trotsky's leadership formed a military Revolutionary Committee, and on the 25th, the authority of that Committee was recognized by the Petrograd garrison. Then steps were openly taken

to form an armed force dependent on the Soviet and independent of the Provisional Government. By the side of this force, which was considered not to be entirely trustworthy, the sailors of the Baltic fleet could be counted upon implicitly: they had long ago thrown in their lot with the advocates of civil war and terrorism. Kerensky assured his ministers, and proclaimed loudly to the population that he had taken the necessary measures to suppress any attempt at a revolt. In reality he had no troops at his disposal except a couple of battalions of military cadets and one company of women. The commander-in-chief of the Russian army relied on speeches against machine-guns, as the Chinese generals of 1860 had relied on painted dragons against the rifles of the English and French expeditionary force. The result was a similar one. On Nov. 7, Bolshevik sailors surrounded the Winter Palace, and after a brief scrap with the women arrested the ministers, the premier and commander-in-chief having disappeared in good time. A lieutenant with some soldiers drove out the Council of the Republic. The Cadet battalions were overpowered, and their remnants massacred by the soldiery and the mob. A small force of Cossacks under Gen. Krasnov skirmished for a few days against the sailors and armed workmen on the outskirts of Petrograd, but eventually concluded an armistice and withdrew. In Moscow the struggle was fierce, and Cadets held out for some time in the Kremlin together with a few loyal battalions. But there, too, defenders of the Government submitted to superior gun-power, lack of supplies and the discouraging influence of discussions and treachery. All along the front the demoralized soldiery rose against their officers and massacred them in the name of the Revolution. The commander-in-chief at headquarters, Dukhonin, was dragged out by a mob of soldiers and murdered.

The first act of the Bolshevik dictators was to satisfy the craving of the masses corrupted by them: private property was abolished, with the reservation that the land of the peasants and Cossacks was not to be confiscated. At the same time the new Soviet Government addressed to all the belligerent States the proposal to conclude peace. The Entente Powers were invited to join in direct negotiations with the Central Empires; failing this, Soviet Russia would conclude a separate peace. The advanced Socialists had no scruples as to the "letting down" of Allies who had been struggling for three years against the German Junkers: what they were chiefly afraid of was an Allied victory.

The same contempt for truth, duty and justice, was displayed in the domain of home politics. The *coup d'état* had left one institution still standing—the Constituent Assembly in process of formation. The Bolsheviks had clamoured for its immediate convocation, and accused all the parties with the criminal design of delaying or preventing its meeting. They were now at the head and could not forthwith stop the elections. These had been prepared laboriously by idealistic doctrinaires—by staunch believers in universal, equal, direct, and secret suffrage. All citizens of both sexes who had attained the age of 20 were to take part in it. To make the arrangements absolutely perfect, the principle of proportionate representation had also been introduced in a somewhat peculiar form. The various parties were to present lists containing as many names as there were seats allotted to the electoral district. The attribution of these seats to the parties was to be made in proportion to the number of votes cast in support of each list, the candidates taking places in the order of their seniority in the parties nomination. The absurdity of these mechanical devices had been already demonstrated by the municipal and rural elections, but the defects of the latter were greatly intensified in the case of the Constituent Assembly. Ignorant peasants were led off to record their votes for long lists of men whom they did not know and in support of platforms they did not understand. The extreme parties did not shrink from any kind of violence and fraud to bring in their nominees. Nevertheless, some sort of elections were actually held, right in the midst of revolutionary chaos, in the months of Nov. and Dec. The result was that the Social Revolutionaries got a large majority, thanks to the votes

of the peasantry, while next came the Bolsheviks, who drew their chief support from the workmen in the towns and from the soldiers. The Mensheviks and the Cadets came in with negligible numbers, the latter with 15 out of a total of 600.

The Bolsheviks were not satisfied with such results. As soon as it became clear that they had not won in the gamble for votes, they began to revile the "parliamentarism" of the Constituent Assembly and of all national organizations as opposed to class groups. When the members of the Constituent Assembly came to Petrograd, and tried to get into the Taurida Palace, they were met by armed guards and ejected from the building. Leading members of the Cadet party, Countess S. Panina, Shingarev and Kokostsev, were arrested as "enemies of the people" and thrown into the dungeons of the Fortress of St. Peter and St. Paul. An order for the arrest of Chernov and Avksentiev was also issued, but they could not be found. At last, on Jan. 18 1918 the opening sitting of the Constituent Assembly was held. Trusty heroes from the Kronstadt fleet, with loaded rifles, surrounded the deputies from all sides; the galleries were packed with a howling mob. In spite of this, the election of the President resulted in a defeat for the Bolsheviks and the Social Revolutionaries of the Left allied with them. Their candidate, Marie Spiridonova, received 158 votes against V. Chernov, who got 244. Nor did the Assembly consent to register all the decrees handed in by the Bolsheviks and to abdicate its legislative power in favour of the Soviets. The armed rulers were not disposed to bow before the recalcitrant Assembly. After sitting one day, it was dissolved and ejected from the Taurida Palace.

By way of justification for this act of treacherous violence, it was maintained that the Constituent Assembly did not reflect the "will of the Revolution," that the "masses" had moved away from the standpoints represented by the party lists, and that, altogether, "formal democracy" has no right to decide in times of Revolution: the leadership ought to belong to the advanced organizations conscious of their aim and intent on achieving it. It was not difficult even for "nebulous" Social Revolutionaries of the Centre and Right to refute these sophisms. They urged with perfect truth that the will of the Revolution in this case meant simply the arbitrary sway of a gang of reckless adventurers, that the Assembly, in spite of all its defects, was the one authorized institution entitled to speak for Russia, an institution which had been recognized and made use of by the Bolsheviks as long as it suited the purposes of their propaganda. But what force had arguments in the face of rifles? The soldiers had run away from the front in order to rob and kill in the name of the Revolution: no one was ready to satisfy and to glorify them to the same extent as the Bolsheviks. Hence there was ample "pragmatic" justification for the Bolsheviks' *coup d'état*. Naturally the first acts of the new era were decrees of the Executive Council proclaiming the abolition of private property and the resolve to conclude a democratic peace.

Peace of Brest Litovsk.—Two parties were necessary in order to conclude that honourable peace "without annexations and indemnities" which the Bolsheviks announced before having informed themselves of the views of the other party as to the conditions of such a peace. Lenin, Trotsky, Zinoviev and their colleagues had, however, made up their minds about certain points, so that the ordinary negotiations were for them only a formal act, attractive in so far as they enabled their *sans culotte* delegation to exchange salutations and to sit at the same table with the diplomats and soldiers of powerful empires. The Bolsheviks had long ago made their choice between the belligerents; they expected and preferred the victory of the Germans, who had served them and provided them with funds in the hour of need. Hypocritical invitations to the Allies to follow in their wake at Brest Litovsk could deceive no one as to their choice. And as they had done more than anyone to corrupt and disband the Russian army, they knew perfectly well that they had nothing to oppose General Hoffmann, when the latter chose to "bang his boot on the table" (Trotsky). Some show was made in their newspapers of strikes in Austria and in Berlin, but it was clearly a case of discussing terms with an opponent who

had disarmed you and may dispatch you at his pleasure. No wonder that Baron Kühlmann, after accepting the formula of an honourable peace "without indemnities and annexations" on the basis of the self-determination of peoples, required the representatives of the Soviet Republic to cede Poland and Courland to the Central Empires, to recognize Finland, Esthonia and Latvia as independent States, to give up the Ukraine on both shores of the Dnieper, and to pay a contribution of 300 million rubles. Trotsky tried to get away with a theatrical gesture; he and his colleagues declared that they could not sign such a humiliating peace, and they departed in noble style. Even this little pretence was not vouchsafed to them. General Hoffmann ordered some German divisions to advance, and the revolutionary army was at once on the run. The delegation of Soviets had to come back crestfallen and to sign a second more dishonourable edition of the Treaty of Brest Litovsk. Lenin was in no way disturbed: he explained to the Third Congress of the Soviets that the Germans had their knees on Russia's chest and that it was no use struggling. Breathing space must be had at any price, in the hope of a further fulfilment of Zimmerwald predictions. The Congress ratified the Brest Litovsk document by a large majority, and a German envoy, Count Mirbach, was sent to Moscow to watch over the exact fulfilment of conditions by the vanquished. Trotsky, who is particularly fond of repeating, at every turn of his account of these affairs, such phrases as "we know" or "we expected," may well claim that this degradation had been foreseen and to a great extent brought about by his party. But the breathing space required by Lenin was provided, not by the Brest Litovsk peace, which was the opening move for the complete enslavement of Russia by the Germans, but by the unexpected fact that the Allies did not succumb, in spite of the treacherous conduct of the Bolsheviks. The Marxist prognostics of the victory of Germany as the nation best organized in a technical and economic sense was shown to be fallacious. The staying power of the Austrian, Bulgarian and German armies proved to be less than that of the soldiers of France, Great Britain and the United States. The victory of the Allies saved Russia from the consequences of Brest Litovsk.

The Rule of the Communists.—In spite of the fact that the elections to the Constituent Assembly had resulted in an overwhelming majority for the Social Revolutionaries, the drastic way in which Lenin and his companions had satisfied the popular demands for peace at any price, for land and for proletarian privileges, ensured to them the more or less fervid support of the masses. The lower classes enjoyed the defeat and humiliations of their betters even apart from direct advantages and even at the cost of some discomfort for themselves. The pent-up resentment and envy of generations found vent in acts of brutal violence and disorder. It was pleasant to see maids of honour sweeping the streets, and generals insulted and sometimes murdered by their soldiers. We are told of cases when the descendants of serfs dug out the skeletons of their former squires from their graves and threw them into sewers. It was an act of frenzy on the part of revolted slaves when the commander-in-chief, Dukhonin, was torn to pieces at his headquarters and Ensign Krylenko installed in his place, or when, later, the heroes of the great war—Ruzsky and Radko Dmitriev—were massacred in Piatigorsk because they did not truckle under the threats of the disbanded soldiery. The officers slaughtered in Helsingfors, in Kronstadt, in Kiev, in Sevastopol, paid with their blood for the disaster of Tsushima, the Sukhomlinov misrule, the cruel discipline of the Old Army. As a result, Bolshevik domination spread over the land like a forest fire, and all attempts at resistance proved unavailing against its elemental progress. The cadets of the military schools of Moscow held the Kremlin for a few days with great gallantry, but they were betrayed by the head of the Moscow garrison; he surrendered them to the Communists "for the sake of peace." Occasional resistance in other towns was put down with even greater ease. The personnel of many administrative institutions went on strike, and attempted to stalemate the usurpers by refusing to serve under them: the strikers were reduced to obedience after a couple of months by

the necessity of earning their bread somehow. Countess Panina, one of the most enlightened and public-spirited Russian women, had acted as Assistant Minister in Kerensky's last Ministry: she was thrown into prison for having supported this strike movement, which the Bolsheviks treated as a "sabotage" of Government services. She was eventually released, but two among the most idealistic, most self-sacrificing of the Liberals who had taken part in the Provisional Government, Shingarev and Kokoshkin, fell victims to a dastardly gang of murderers in a hospital where they had been lodged on account of illness.

The only serious attempt to oppose armed resistance to the bandits was offered by Gen. Alexeiev and the indefatigable Kornilov. They collected a few thousands of devoted men, most of them officers, formed them into improvised units, and took the field against the Bolsheviks in a far-off corner of the empire in Northern Caucasus. Kornilov fell in the unequal struggle, but his comrades succeeded in building up gradually a "Volunteer Army" which held its own in the Kuban territory. It was too weak to advance because the Cossacks, instead of joining it with all their forces, wavered and negotiated. Hetman Kaledin, a brilliant general who had won conspicuous distinction in Brusilov's campaign of 1916, was so grievously affected by this lack of patriotism that he committed suicide; and his successor, Krasnov, preferred to enter into an agreement with the Germans, who were spreading their tentacles from the Ukraine to the Donets and to the Volga.

The rise of the revolutionary tide was, however, not a constant and unbroken process. The shattered forces of the past did not give way without repeated attempts to reassert their vitality. The Orthodox Church that had grown up with the Russian people in its hard struggle for existence could not be reconciled with the rule of aggressive materialists. Everywhere the clergy exerted its influence publicly and secretly against the anti-Christian rulers. Tikhon, the newly appointed Patriarch of Moscow, whose chair had been set up again by a national Council of the Orthodox Church after an interval of 200 years of Babylonian bondage to lay bureaucracy, denounced and anathematized the Communists. Everywhere processions and ceremonies recalled to the popular mind the ancient traditions of creed and ritual, and even the most hardened among the rioters and deserters responded at times to these emotional appeals. The Bolsheviks turned sanctuaries into public halls, desecrated revered shrines, tortured priests and shot bishops, but these persecutions strengthened the moral hold of the Church on the flock, purified the sunken priesthood by a new baptism of blood. Among the Intellectuals themselves, religion regained many adherents, and men like Eugène Trubetskoy or Bulgakov, who had stood up for Christian ideals in the days when it was considered ridiculous for an educated man to do so, found themselves at the head of a powerful movement.

The Liberals also did not give up the struggle. A number of more or less secret associations sprang up. The Press was being gradually gagged by the Bolsheviks, but these associations continued their underground existence in spite of the espionage and arrests. The most influential were the Radical League of Reconstruction (*Soyuz Vostrojdenia*) led by Avksentiev and Argunov, the "Centre," composed of Cadets and Left Octobrists with N. Astrov and N. Shtchepkin at their head, and a union of the Rights whose principal leaders were Krivoshein and Gourko. The question of yielding to the Germans and crushing the Communists with their help was eagerly discussed in connexion with the plan of a monarchical restoration. The idea found favour among the Rights and was supported among the Cadets by P. Milyukov, who had fled to Kiev, and considered that the game was definitely lost by the western Allies and that it was wiser to accept defeat from the Germans than from the Bolsheviks. This view was, however, decisively rejected by the Liberals and the Radicals, who remained staunch in their allegiance to the Entente and could not bear to think of German domination. The chastisement for this independence of mind followed closely upon the offence: the Cadets had held a conference in Moscow on the political situation on May 13, 14 and 15,

and had endorsed the policy of their leaders to remain faithful to the Entente: on May 17 their various centres were raided and many representatives arrested. Others fled south and east, but Moscow was still the nucleus of a "National Centre."

Policy of the Allies.—How did the Entente Powers react against the disruption of their alliance with Russia? Their ambassadors, having watched with anxiety the decay of the monarchy, offered ineffectual advice, and informed their Governments of the precariousness of the situation without being able to suggest any effective course of policy. When the blow fell, the Entente Powers accepted the verdict of the Revolution as a necessary consequence of Tsarist misrule, and the President of the United States actually felt more free to join the western coalition, since the danger of a victorious advance of Tsarism had been removed. The device of a double diplomacy was adopted: while Sir George Buchanan and M. Noulens continued officially to represent Great Britain and France, special envoys were dispatched to Petrograd as emissaries of various groups of Socialists faithful to national traditions. Arthur Henderson for Great Britain and M. Albert Thomas for France were even entrusted with official missions. The main object was to steer the Russian Revolution into a warlike course, to keep up the eastern front, and to provoke a resumption of the Russian offensive. The results of this unusual diplomacy were very heterogeneous. While Albert Thomas eagerly supported Kerensky in his patriotic appeals to the army, as well as in his attempts to arrange a coalition with the Soviets, Arthur Henderson became convinced of the urgent need of peace and favoured a meeting of Labour delegates in Stockholm.

The evolution of Russia was not much affected by these contradictory views of the Entente emissaries. The offensive was tried with disastrous results. The Russian army dissolved under the influence of the "peace at any price" movement. Disappointment with the conduct of revolutionary Russia was reflected in the sympathy on the part of certain circles in England for Kornilov's attempt, a sympathy which did not help but rather hampered him. The advent of the Bolsheviks drove the western Powers into an attitude of absolute helplessness. They could do nothing to counteract the Brest Litovsk negotiations, and, at the same time, they were not in a position to break off all relations with the Communist Government for fear of its taking sides with the Germans. Even the shooting of the British naval attaché by Bolsheviks did not rouse them from their torpor. The Brest Litovsk peace, the occupation of southern Russia by German troops, the intervention of the Germans in Finland, obliged them, however, to adopt a decision. The embassies were gradually withdrawn, the semi-commercial and semi-diplomatic mission of Mr. Lockhart did not lead to any favourable results, and in the summer of 1918 all official relations with the Government of the Soviets were broken off. A state of more or less active hostility set in when the anti-Bolshevik troops were being reorganized on an extensive scale in various parts of Russia. The White forces received support from the Allies in the shape of military supplies, occasional expeditions, and a blockade of the ports controlled by the Soviets. Concurrently with this intermittent support of Russian national armies, the Allies encouraged and protected all the nationalities of the Empire which were striving for a separation from Russia: Poland and Rumania came to be looked upon by the French as the bulwarks of Western civilization against Russian barbarism and German militarism. The Baltic States (Latvia, Esthonia, Lithuania) and the Caucasian formations (Georgia, Armenia, Azerbaidjân) were backed in their separatist aspirations by Great Britain. This tendency to dismemberment of the Russian Empire could not be harmonized with the ideals and efforts of Russian patriots, but the Entente Powers did not pause to reflect on the inadvisability of destroying with one hand what they were helping to build up with the other. Psychologically, their centrifugal policy was connected with old antagonism to the Russian Empire, with dreams of national self-determination, restricted somehow by the vital interests of the "Big Four," and—after the victory over the Central Powers—with the

Versailles delusions of overwhelming power over the world. The incoherence and vacillations of Entente policy might not have been so pernicious if Russian patriots had been able to muster an overwhelming array of anti-Bolshevik forces in Russia itself. Unfortunately this was not the case.

Anti-Bolshevik Governments.—During the first months of the Soviet regime, while the power of the proletarian dictators was still shaky and unorganized, several concentrations opposing them were formed in the East. First, Colonel Semenov, a leader of Transbaikalian Cossacks, had started a guerrilla warfare on the borders of Mongolia and Manchuria, advancing in the direction of Chita when luck favoured him and retreating across the Chinese frontier when he met superior forces of the Bolsheviks, together with the Magyar, Austrian and German prisoners of war mobilized by the latter. In May 1918, he succeeded in forming a provisional government in Chita. Soon afterwards, Admiral Kolchak, a brilliant naval officer, who had distinguished himself in the Japanese War, organized another Provisional Government in Novo Nikolayevsk at the junction of the Siberian railway with the Maritime province line. The Japanese, who had landed a detachment in Vladivostok, supported him in a general way.

About the same time, in the spring and early summer of 1918, there occurred another startling event. Czech detachments which had been formed to fight for Russia from among prisoners of war, and who had fought gallantly against the Central Coalition in the last campaign, demanded to withdraw after the débâcle of the Russian army and the advent of the Bolsheviks. They were allowed to do so by the Soviet authorities, but they were to be disarmed, and in the course of their movement east towards Vladivostok they were subjected to offensive and treacherous treatment. Some of them refused to give up their arms; others, after having been disarmed, broke away, recovered arms and munitions, and turned on the undisciplined rabble of the Red troops. As a result of encounters of this kind, the Czechs, and some Slovak detachments which had joined them, seized great tracts of the Siberian railway line near the Volga, near Irkutsk, and by Vladivostok. Eventually, after many vicissitudes, these corps made their junction along the whole line. The total number of troops who effected this *coup de tête* averaged some 80,000 men. It would be useless to follow in detail the awaying fortunes of these detachments. Their daring exploits would hardly have achieved success if a considerable portion of the population of eastern Russia had not sympathized with them. As it happened, these disciplined troops succeeded in creating the backbone of resistance against the Moscow dictators: in Siberia, Provisional Governments were formed in Vladivostok, in Harbin (General Horvath), and in Tomsk, besides the centres of military administration started by Col. Semenov and Admiral Kolchak.

Unfortunately the various governments comprised different and mutually hostile groups, which could not be prevailed upon to act loyally together. The Vladivostok concentration reflected the Socialist ferment in the country, and worked for an independent Siberia. The Government formed in Tomsk was an Executive of a Siberian Duma, composed of delegates from various organizations—zemstvos, municipalities, political parties, social groups (workmen, students, coöperative associations). The majority of these constituencies followed a socialistic orientation, but their Executive adopted a more conservative policy and admitted several Cadets into its ranks. From Samara came yet another political tendency: some thirty fugitive members of the Constituent Assembly, dismissed by the Bolsheviks, had assembled there, and their political creed was expressed in the demand for a restoration of that Assembly, which they considered as the only body constitutionally entitled to wield power in Russia. Their aim was to reconstitute an All-Russian State, which would include Siberia as an autonomous part of its organization. On the other hand the administrations of General Horvath and Admiral Kolchak, while reserving the ultimate decision as to the system of Government to a new Constituent Assembly, discarded the authority of the

one elected in December 1917 as not representative of Russian opinion. These administrations favoured the propertied classes and built up their personnel from the remnants of the military and civil bureaucracy of the monarchical period. Even in the face of the enemy all these groups found the greatest difficulty in establishing coöperation. The Vladivostok Government submitted to the authority of the West Siberian one, but the negotiations with Horvath were protracted and fruitless. A *coup d'état* on a small scale was attempted in Vladivostok by Horvath's lieutenant, Gen. Pleshkov, but the Allies intervened to reestablish the Socialist administration because it was approved of by the Vladivostok zemstvo.

In the west a conference held in Ufa laid down the foundations of an All-Russian scheme in connexion with the Constituent Assembly of 1917, and succeeded in persuading the Siberian Government in Omsk to recognize its authority. The moving element in this case came from the Moderate Socialists, chiefly Social Revolutionaries, but Social Democrats of the Plekhanov persuasion and some Cadets were in agreement with them. A directorate of five consisting of Avksentiev, Zenzinov, Vologodsky, V. Vinogradov and Gen. Boldyrov was established. Admiral Kolchak accepted the portfolio of War in the Ministry which was to conduct the actual administration. This amalgamation of Governments was arranged in the beginning of Oct., and a mobilization of certain classes of the Siberian population which had been started somewhat earlier was carried out on a more extensive scale: it yielded some 150,000 men, whose military instruction had to be taken in hand under very difficult conditions. Many delays and mistakes occurred, and the different sets of people who had been brought together with such difficulty quarrelled over the task, suspected and accused one another. The officers who had served under the old régime were displeased with the policy of the Directors, whom they accused of indecision and vain talk; the Socialists chafed at the high-handed way in which they were treated by the military chiefs and the employees of the Ministries. In the night of November 18 these dissensions came to a head. A party of soldiers led by officers of the Omsk garrison arrested the Socialist members of the Directorate, Avksentiev and Zenzinov, and two of their assistants, while a third Director, Vologodsky, joined a meeting of Ministers which elected Admiral Kolchak as Supreme Ruler. In the communiqué issued on the occasion by the newly constituted Government, it was explained that "wide social circles had been discontented with the wavering behaviour of the Provisional All-Russian Government in regard to certain tendencies of the Left leading to the renewal of a destructive policy. While condemning the *coup d'état* as an illegal act the new Government endorsed it by taking advantage of the accomplished fact: Avksentiev and Zenzinov were allowed to escape and the two remaining Directors, Boldyrov and Vinogradov, retired.

Such a start did not augur well for the future of the reconstruction movement: it showed that the enemies of the Bolsheviks were still irreconcilably divided by the old feud between Conservative Nationalists and Socialistic idealists. These conflicts helped to keep alive in the mass of the people a spirit of lawlessness and distrust. And yet nothing was more needed in those days than steadiness and forbearance as regards details; those who had assumed the task of restoring order were least able to lay claim to efficient administration—the lack of experience and even honesty was felt everywhere. The mobilization, for example, was carried out in the most haphazard fashion, crowds of conscripts being left even without accommodation.

The fact that the Bolsheviks in Siberia were drawing largely for support on the Austrian, Magyar, and German prisoners, of whom about half a million were dispersed in various localities of the wide country, and the difficult situation of the Czechs astride the Siberian railway, had provoked an intervention of the Allies. Japanese, American, British and French detachments were landed in Vladivostok with instructions of varying intensity: all the intervening Powers gave assurances of their disinterestedness, of their friendship for the Russian people, of

their resolve to leave it entirely free to decide as to its destiny; but while the Japanese were committed by their past and their future to safeguard and promote their own interests, the Americans were enjoined to restrict themselves to guarding railway communications and stores, and the French colonial troops held aloof. The British followed a middle course in the sense that part of their contingent, Col. J. Ward's Hampshire Regiment, was pushed forward right through Siberia, but there was no clear military aim in that operation and steps were retraced when the real difficulties set in. Material support was given by the British more than by anybody else, but these measures were in the nature of a risky speculation dependent on the trend of home politics and on the ability of the "White Guards" to win the game.

A somewhat different situation arose in the north of Russia, where the rule of the Soviet Commissars was overthrown both in Archangel and in the Murman, and a patriotic Government was set up under the leadership of N. Tchaikovsky, a "Popular Socialist," who had lived in England for many years as an exile. The opposition between progressive and conservative circles, and the difficulty of conducting business with the available demoralized elements, were also felt there, but Great Britain's stake in the game was much more conspicuous, and the British detachments under Generals Maynard and Ironside formed a very important part of the forces operating against the Bolsheviks. There was, however, no real cohesion between the Russians and their British allies, although cases of acute hostility were exceptional. Apart from such dissensions the ground was felt to be shaky on account of the war-weariness and the fickle temper of the common people. The massacre of the British officers by the men of Dyer's battalion showed that Bolshevik propaganda and Bolshevik habits were by no means a thing of the past.

The southern front, organized by General Denikin after Alexeiev's death, was suffering from similar weakness. The Voluntary Army constituting its backbone had become an efficient and powerful instrument of war; the officers' division, which had formed its bulk in the beginning, had expanded gradually into several corps by drawing into its ranks veteran soldiers who had learnt their trade in the terrible battles against Germans and Austrians. But the trusty regiments named after Kornilov, Alexeiev, Markov and Drozdovsky, had to act together with the levies of the Don and the Kuban Cossacks, who, though unrivalled as irregular horsemen, had their own axe to grind in the conflict. The Don province had been subjected to repeated attacks and devastation, and many of the Cossacks were anxious to keep to their frontiers and to manage their own affairs. As for the Kuban people, they were divided among two sets: the men of the "line" in the north were patriotic enough and fought brilliantly, but the Black Sea Cossacks, mostly descendants of the Zaporog Cossacks transferred to the Kuban from the Dnieper by Catherine II., were animated by a spirit of separatism and ready to follow leaders who worked for a Cossack Republic. A great deal depended on the skill and the political insight of Denikin's administration, and in this respect, as on the eastern front, grievous blunders and abuses occurred. The main direction was necessarily in the hands of military commanders inclined to insist above all on discipline, and contemptuous as to political theories and subtle distinctions. Denikin himself, though perfectly honest and straightforward, held systematically aloof from constitutional disputes, and declared his task to be primarily one of liberation and restoration. His principal assistants, Generals Dragomirov and Lukomsky, had even less taste for political "metaphysics," and one of the civil advisers, Prof. K. Sokolov, openly expressed the view that the only régime suited to the circumstances of the time was a "democratic dictatorship" satisfying the needs of the common people. Although nothing was prejudged as to the ultimate form of Government, the organization of the southern territories occupied by Denikin was cast in the mould of the supreme authority of the commander-in-chief. By his side stood a Special Council composed of the heads of departments and of a few representatives of public

opinion. All the members—some twenty—were nominated by the commander-in-chief. The elements of military and civil bureaucracy were decidedly predominant, and the "Left" was confined to three Cadets, all moderate Liberals. The Socialist parties were excluded from the Government and kept under strict supervision as regards their Press. One of their influential leaders, Schreider, was deported by order of the Government; many others left of their own accord for the Crimea. The greatest difficulty was experienced in holding the balance between the aims of the Volunteer Army engaged in the reestablishment of a National State and the aspirations of the Cossack communities tending towards federalism. The problem of reconciling these contradictory tendencies was a most difficult one. The Kuban Rada (Assembly) manifested openly separatist leanings: its leaders, Bytch and Makarenko, were dissatisfied with a dualistic arrangement contrived after many efforts between the Higher Command and the Rada. They wanted the political independence of the Kuban to be recognized, and sought an alliance with other Cossack territories in order to strengthen their demands. This political strife reacted in a most unfavourable manner on the conduct of operations in the field.

Reds v. Whites.—Disgust with the hypocritical tyranny of the Bolsheviks and the humiliation of Russia found a vent in conspiracies and risings among the intellectuals. The German ascendancy was challenged by the murder of the ambassador, Count Mirbach, in July 1918. Almost simultaneously the commissar in charge of the police in Petrograd, Uritsky, was killed, and Lenin himself dangerously wounded by a Socialist. The Social Revolutionaries made an attempt to overthrow the Bolsheviks in Moscow, but were suppressed with great slaughter. Later on, the most experienced of Terrorists, Boris Savinkov, engineered a rising in Yaroslavl and neighbouring districts; it was quelled after bitter fighting. These isolated attempts in the heart of Russia were not so dangerous as the simultaneous advance from the east and the south. Kolchak's armies reached at one time Kazan and Simbirsk, Denikin pushed as far as Orel, and in the north there was some hope that Gen. Ironside's British column might have joined hands with Kolchak's force near Kotlas. The Communists made desperate efforts to meet the onslaught. The Red hosts were reorganized by former officers of the Imperial army, with Polivanov, Theremissov, Klembovsky, Parsky, Dalmetov at their head. Even Brussilov lent the prestige of his name to the cause of the Moscow Soviet. These men were inspired not only by the pressure of want and despair, but in many cases by a fatalistic belief that they were serving the interests of Russia under the Red flag as against reactionaries and foreigners. An iron discipline was reintroduced, disobedience, treachery and cowardice were promptly punished with death, desertion was repressed as far as possible, there was no more indulgence for committee discussions or for the "self-determination" of military units which had wrought havoc in the last stage of the war against the Central Empires. In every battalion, squadron and battery nuclei of devoted Communists were inserted in order to watch and to lead the apathetic rank and file. Altogether the proletarian dictators reverted without any scruple or confusion to the practices they had fiercely denounced in the time of defeatist propaganda. The cadres of the army were gradually filled by wholesale mobilizations, and although crowds of conscripts were swept away by desertion, there remained enough in the ranks to outnumber the White forces: the fact that the Bolsheviks had got hold of the solid centre of Great Russia against the weaker outlying portions of the Empire was bound to assert its overwhelming influence in the end. Of course, if there had been an elemental popular rising against the proletarian leaders, they could not have withstood the attack. But the Great Russian peasantry, although by no means sympathetic to Communist doctrines and hostile to many of the commissars, were yet under the spell of the opinion that they were defending their newly conquered land against the squires who wanted to get it back. While this broad basis of popular support remained unshaken the dictators could exert their cruelty and lusts with impunity.

Terror against the bourgeoisie had been proclaimed by them from the very beginning: it formed one of the main planks of their platform. It was expanded into a system of wholesale slaughter and ruthless inquisitorial measures as a means of self-defence. The Extraordinary Commission (the famous *Tchervichayka*) thrust the Tsar's *Okhrana* into the shade; as a matter of fact, it was served to a large extent by hangmen, torture-masters and spies borrowed from the Tsarist police, but acting with much greater independence and thoroughness. By the side of this cold-blooded and systematic machinery for crushing human beings acted innumerable gangs of ruffians and criminals, who robbed and killed in the sacred name of the Red Revolution with complete impunity and with the approval of the ruling powers. It is quite impossible to estimate the number of victims who fell a prey to this campaign of hatred.

Here is an extract from Bolshevik sources which may illustrate this butchery, although it does not in any way give an idea of its real dimensions:—

"In 1918 the persons arrested on the charges of counter-revolution, crime in office, speculation, use of forged and other people's documents, etc., numbered 47,348. In 1919 the activities of the *Tchervichayka* developed, and the number of persons arrested reached 80,662. Out of the total number of persons arrested in 1919, 21,032 were classed as counter-revolutionaries, while 19,673 were arrested for crimes of office. Out of the 128,010 arrested in 1918-9 54,250, or 42½%, were liberated without subsequent consequences. Eight per cent of the total number of persons consisted of hostages. Nearly 11% were sentenced to compulsory labour, 29% retained in prison, and nearly 8% went into concentration camps. In 1918 6,185 persons were executed and 3,456 in 1919, the total number during the two years being 9,641." (*Lazies, The Fight on the Home Front.*)

In such cases it is not only the number of victims that counts, but also their quality: as in the times of Ivan the Terrible, only "God knows the names of the murdered," but let us notice by way of example that some of the most respected among Moscow's citizens, whose whole lives had been devoted to the service of the people—the Astrovs, the Alferovs, N. Shtechepkin—were shot as "spies" in the summer of 1919.

What did the Whites oppose to the Red fury? In fighting prowess the Whites were more than a match for the Reds, especially on the southern front: the exploits of Wrangel's Caucasian corps in the attack and defence of Tsaritsin, the advance of the Volunteer army's infantry against heavy odds on Kharkov and Kursk, the rally at Rostov in the last months of 1920, are proofs of the excellent quality of Denikin's troops. Kolchak's Siberians were not seasoned to the same extent, but they were good material and improved rapidly, and the Orenburg and Ural Cossacks operating between the two groups did everything humanly possible to oppose the Reds. But neither the eastern nor the southern armies were supported by a tolerably organized rear. Kolchak and Denikin moved rapidly forward in the hope of cutting off the economically important district of the Ural, the Donets, the corn-growing provinces along the Volga and in the Ukraine, but their rapid advance involved a hasty and superficial occupation of wide tracts. They flooded their regiments with unwilling conscripts and had to rely for supplies on requisitions: the corn and the horses of the peasants were seized without any regard for the needs of the farmers, while the raids of Cossack cavalry into regions held by the Reds resulted in indiscriminate looting of friend and foe. What constantly happened in such circumstances was that the advancing Whites were received with "bread and salt" and attacked in the rear when they had been in the country for some time.

If the White leaders had succeeded in persuading the people that their aim was genuinely patriotic and that private interests had to be sacrificed for the sake of the great cause, all the miseries of civil war might have been endured, if not willingly, at least with resignation. But neither on the eastern nor on the southern front did the Whites establish confidence, that condition precedent of success. There cannot be the slightest doubt that not only Denikin and Kolchak, but also their principal followers were fighting for the ideal of a reunited and free Russia, but there was too much of the hated past intermixed with their efforts; corrupt officials, greedy squires had flocked to the White

banners and were clamouring and pressing for revenge and compensation. The frequent cases of lynching of commissars and Communists were an inevitable consequence of the civil war and of the hatred inspired by the wreckers of Russia: it was impossible to draw the line between justified retribution and wanton cruelty in many of these explosions of wrath. Sometimes, as in the case of Jewish pogroms in the Ukraine, subordinate officers acted against the direct orders of the High Command. But there were other signs of the time in the policy of the White leaders which created the suspicion that they were out for a counter-revolution, for the reestablishment of the old monarchy and the old gentry. The Socialists, who formed a great part of the intellectual class as far as the latter still existed, were driven back without any regard for the fact that they were natural allies in the struggle against Communism. One of the leading members of the Constituent Assembly was shot by Kolchak's Government in Ekaterinburg. The same fate befell leaders of the Kuban separatists in Ekaterinodar. The Liberal members of the Denikin "Special Council," like N. Astrov, protested in vain against a policy directed against all Socialists indiscriminately. If Denikin had not personally prevented further persecutions and open reaction, the dictatorial schemes of the generals would have been embodied in some drastic Act of the State for which Prof. K. Sokolov would have supplied a juridical formula. As it was, for the mass of the people the repeated protestations of acceptance of the social results of the Revolution seemed belied by the way in which agrarian reform¹ was to be regulated. The subtle distinctions concerning compensation and redemption tax reminded the peasants forcibly of the procedure followed by the Emancipation Act of 1861, and the Reds were not slow to take advantage of this unfortunate association of ideas. The Whites started also a propaganda office (*Osvag*), but although some 200 million rubles are said to have been spent on it, its activity was subjected to bitter criticism by various groups in the camp of the Whites. The state of affairs brought about two fatal results—confusion in the rear of the White armies, and discord between the patriotic forces in Russia and the Allies.

The conditions in the rear of Denikin's army were described by Soviet propagandists with ironical satisfaction. There can be no doubt that the activity of "green" bands of marauders, and the rise of such potentates as Makhno, a brigand whose followers are said to have mustered at times some thirty thousand, made orderly life in the rear impossible and drew off considerable forces at the most critical moments for the maintenance of some sort of communications. What proved even worse was the defection of dissatisfied Cossacks. When the Volunteer army was straining its forces to hold the line against the Reds north of Rostov, Kuban troops left their positions and went home, leaving Denikin's right flank unprotected.

A similar state of affairs prevailed on the eastern front: the population in the rear, excited by Communist propaganda and fraternizing with the lawless elements so numerous in Siberia—convicts and prisoners of war—conducted a constant guerrilla warfare against the Russian and foreign troops protecting the Trans-Siberian railway line. Kolchak tried to counteract this shocking demoralization by reorganizing his government under

¹ The following were the conditions of land reform proclaimed by Denikin on July 19 1919:—

- (1) Safeguarding of the interests of the toiling population;
- (2) The creation and the placing on a sound basis of small and medium homesteads out of the land belonging to the State and private owners;
- (3) The preservation of the right of the landowners to their land, coupled, however, with the apportionment in each district of the amount of land that is to be retained by the former owner and the order of the transfer of the remainder into the ownership of those who are land-poor;
- (4) These transfers may be achieved by *voluntary agreement*, or by *obligatory alienation for compensation*. The new owners are to acquire inalienable rights to their allotments.
- (5) *Intensive aid to be given to tillers of the soil*, through technical improvement of the lands, expert agricultural assistance, the supply of implements, seeds, dead and live inventory, etc.

the leadership of an energetic and enlightened man, Pepel'ayev. It was too late and the administrative personnel too insufficient to avert the catastrophe. The eastern front gave way even before the southern one. Thousands of soldiers and refugees perished in the retreat through the icefields of Siberia in the winter of 1919-20; Kolchak and Pepel'ayev, who had sought the protection of the Czechoslovaks, were handed over to the Bolsheviks in pursuit with the consent of Gen. Janin, the commander of the Allied contingents, and shot; while the Czechs succeeded in extricating themselves and carrying off part of the gold reserve seized during the occupation of Kazan.

Allied Intervention.—The action of the Allies in these deplorable times was contradictory and ineffective. Large quantities of munitions and supplies were furnished to the patriotic armies; sometimes the consignments arrived late or were in damaged condition, while a good deal of pilfering and embezzling occurred, but, on the whole, it is certain that the White armies could not have held the field for a month without this material assistance. Huge sums of money were provided to help the Russian commanders to tide over their financial difficulties, and it is estimated that the British spent about £100,000,000 in these transactions. But while so much was done in this direction, the diplomatic and strategic steps taken by the Allies were not only inadequate, but often mischievous. The policy of support for the patriotic movement in Russia lived, as it were, under a cloud: it was disturbed and hampered right through by the opposition of strong currents of opinion in western Europe and in the United States. There was, to begin with, the fear of infection of Allied troops by Bolshevik propaganda—a fear justified to some extent by such facts as the conduct of French sailors and soldiers in Sevastopol and in Odessa, where the red flag was actually hoisted by French men-of-war, and certain battalions of the army of occupation showed a marked disinclination to fight the Reds. This fear that war-weary soldiers of the Entente might not be proof against Communist propaganda led to the undignified scampering out of the Crimea and from the south-west. Even more important was the sympathy shown to the cause of the Bolsheviks by Socialists in France and the Labour party in England, a sympathy in which they were supported by influential organs of the Radical press. This feeling manifested itself in a variety of shapes and degrees: some regarded the violence and destruction of the Communist upheaval as the beginning of a new era in social history characterized by the overthrow of capitalism; others condoned terrorist methods as a necessary means of revolutionary action; others again were prepared to admit that these methods were justified by the misrule of the Tsars that had provoked the vengeance of the people; all were inclined to balance the misdeeds of the Reds by the excesses of the Whites and all objected to intervention in favour of the latter. The reorganization of Russia on Imperial lines was distasteful to many English Conservatives who were still under the influence of the ideals of Disraeli. Last, but not least, there was a growing number of "realists" who contended that the Bolsheviks had proved their right to rule because they had defeated their opponents in the field and that in these circumstances it would be best to recognize facts and to draw from them such advantages as could accrue to business men from the needs of a great country.

The weaknesses and failings of the White organizations in Russia presented most convenient materials for the action of all these elements opposed to Allied intervention. The result was a series of inconsistent steps which contributed to the decline of the cause of reconstruction. In Jan. 1919 came the proposal of the "Big Four" that the belligerents of the civil war should meet in Prinkipo and discuss conditions of pacification—a proposal that reflected in a striking manner the peculiar combination of impractical idealism, superficial knowledge and the yielding to "happy thoughts," which formed one of the characteristics of the Versailles Conference. As the Arcadian perspectives of Prinkipo did not meet with the expected response on the part of the belligerents, schemes acknowledging the standing of the proletarian dictators began to crop up, in connexion with fa-

vourable reports by enterprising American journalists (Mr. Bullitt's mission). At the same time the British War Office countenanced the plan of a raid on Petrograd to be carried out by the victor of Sarikamish, Gen. Yudenich. This enterprise was attempted with insufficient forces (some 15,000 men); it was in the nature of a gamble, but even gamblers do not usually put stakes on opposite sides. In this case, however, the Allied High Commissioner, Gen. Sir Hubert Gough, paid more attention to the aspirations of Esthonians, who were anything but keen to promote Yudenich's success, than to the requirements of the Russians. The climax of that form of intervention was reached when Gen. Gough's chief-of-staff, Col. Marsh, gave the Russians three-quarters of an hour to form a North-Western Government and to recognize the independence of Esthonia. No wonder the expedition did not prosper.

By Nov. 1919 Mr. Lloyd George had come to the conclusion that it was advisable to renounce intervention and to leave Russia to her fate. Though doing lip service to the unforgettable services of Russia in the war, he submitted that it was not in the interest of Great Britain to assist in strengthening that country. This point of view prevailed definitely in 1920. When Denikin was forced to abandon the North Caucasian territory, British policy steered towards a liquidation of the Russian imbroglio. Wrangel made a last and gallant stand in the Crimea, but he was recognized and supported by the French only, while Great Britain took up an attitude of neutrality favourable to the Moscow dictators.

In the war which Poland waged rather imprudently when the danger of restoration of Imperial Russia had vanished, Great Britain was prepared to surrender Poland to Bolshevik hegemony, and when the tables were turned before Warsaw, thanks to the assistance of the French, British diplomacy employed itself in arranging an armistice between Poles and Bolsheviks which enabled the latter to concentrate their forces against Wrangel and to crush him. This cleared the way to a "complete control" of Russia by the Communists, and enabled the British Premier to give effect to the plans of a resumption of commercial relations with "Sovdepia." There were, indeed, two aspects of Bolshevik policy to be considered—the alluring prospect of exploitation of latent and immense natural sources offered by Mr. Krassin, and the uncompromising attitude of the Third International, founded in Moscow for the express purpose of revolutionizing the world by fair means or foul. While France and the United States refused to have anything to do with a "Government of assassins," realistic considerations prevailed with Great Britain and Italy. Communist propaganda was treated as a bogey, and disarmed by certain stipulations as regards India and by vague promises of a general nature. On the other hand the door was open to trade, not indeed on account of "bulging corn bins" in Russia (as Mr. Lloyd George had once suggested), but on account of her need of everything in the way of raw materials and manufactures. The dictatorship of the proletariat was recognized as the *de facto* Government of Russia, and its leaders encouraged to adopt a policy of renunciation of their doctrines in return for retention of power.

THE SOVIET CONSTITUTION

It remains for us to consider the internal evolution of this newly recognized member of European society, and the results achieved by its rule.

Apart from general declarations of principles, the constructive policy of the Communists may be said to have been initiated at the fifth Congress of Soviets which met at Moscow in July 1918. It consisted originally of 1,132 members with power to vote, of whom 745 were Bolsheviks, 352 belonged to the Social Revolutionary Left, 14 were Maximalists, 4 Anarchists, 4 Social Democrats of the Internationalist group, 10 were outside any party, 3 belonged to "miscellaneous groups." At a later stage the Social Revolutionaries disappeared in consequence of disagreement and risings, and the Congress was supposed to comprise about 1,000 members. From a formal point of view the most important business transacted by this Congress was the

acceptance of the Constitution, but this was carried in a hurried manner at the close of the session and without any debates to speak of, when the opposition had been ejected from the Assembly. Nevertheless it is advisable to begin with a summary of its most important provisions. It proclaims itself to be the Constitution of the Federal Socialistic Republic of Soviets. As a matter of fact there was no federalism about it, as no means had been provided for any genuine expression of the will of the component parts. The Ukraine, for instance, was never allowed any self-determination, but was simply conquered by the Bolshevik armies and subjected to the rule of Moscow authorities, although the pretence of separate existence and organization was kept up. The social basis of the republic was formed by the workmen and the peasants, while all those who used the labour of others for their benefit were disfranchised.¹ One of the fundamental assumptions of the system was that the normal kind of work that counts is manual work and all forms of activity which do not take the shape of manual work have, as it were, to justify their existence in relation to manual work. At best a rough equation was established between various forms of employment, at the worst people who could not claim the designation of workmen were declared to be bourgeois under suspicion. In principle no distinction was made between various kinds of performance in point of quality, and in introducing the project of the Constitution the reporter, Stekloff, appealed in as many words to the famous maxim of Fourier: "To everyone according to his needs." It may be noticed, however, that the other side of the saying—"From everyone according to his faculties"—was also acknowledged in a somewhat peculiar form (by Trotsky): those who refuse to work need not eat. The threat was directed primarily against the civil servants who had thrown up their office work, but the principle admitted of wider application and came to be applied to workmen in general.

There was no attempt at democratic equality, in any sense. As regards electoral representation, for instance, an industrial worker was treated right through as worth five peasants: 25,000 of the former were reckoned for each delegate of a Soviet Congress and 125,000 of the latter; the same ratio obtained in local and provincial organization.² Instead of the *direct* elections on which so much insistence was laid in the democratic stages of the revolutionary movement, all elections were managed on the principle of an ascending scale from lower to higher units. The result was that undesirable elements were weeded out in the process by means of wire-pulling or by downright violence. The clubs of Communists in the various local centres acted as committees of supervision, and terrorized the country so effectually that the Communist party, which on its own showing did not number more than 600,000 members, invariably captured three-fourths or more of the seats in the Assemblies.

The masses of the peasantry, to whom reference was so often made in the speeches of official Bolshevik orators, had much less chance of being heard than in the gerrymandered Dumas of the Tsarist regime: the so-called delegates of workmen, soldiers and peasants were generally intellectuals with a more or less incomplete educational record, but expert in journalistic propaganda and free from all received notions as to morality, humanity or justice. The Congress of Soviets should have met at least once in six months; but this rule fell into abeyance, and the years 1919 and 1920 saw only two congresses (the seventh and the eighth). The intermediate institution of the Central Executive Committee of 200 (later 300) had to act as a kind of Parliament in the absence of the Congress, and was entrusted with supreme authority all the while; but the Board of Commissars of the People, corresponding to a Council of Ministers

under the Parliamentary regime, wielded the real authority. It took its lead again from its *presidium*, on which the Government of Russia entirely depended. In this way the appearance of democracy was reconciled with the reality of a very narrow oligarchy, according to the pattern worked out by the French Jacobins in the days of the Committee of Public Safety. A curious device of the sophistical combination consisted in making members of the Central Executive Council at the same time supervisors and subordinates of the commissars, as if genuine control could be expected from persons employed in working the machinery under control.

Local units were subjected to similar limitations: the bourgeois of all descriptions were condemned in every respect to the position of outcasts. Elections were to be conducted under constant pressure from the Communist clubs, and inconvenient persons were to be removed from participation in local as well as central government. A characteristic application of this all-pervading suppression of the bourgeois is the handing over of all technical means of publicity, in other words of the Press, to the workmen and peasants. This meant that there is no possibility for expressing any opinions except those approved by the Bolshevik clubs. The Press was not gagged—it ceased to exist as a free agent. It became a means of reproducing in thousands of copies the standard views decreed by the Bolsheviks. The Tsarist regime never aspired to this complete suppression of public opinion. The right of assembly was vindicated in the same way in the Constitution. The preamble of it started with a sounding declaration of freedom; but it was sufficient for commissars to declare a meeting to be counter-revolutionary in order to be entitled to put an end to it by force.

The Bolshevik legislators prided themselves on having got rid of the division of the functions of legislation and administration, and treating both as alternative manifestations of the will of the living communities of workmen and peasants. One of the effects of this unification of power in the collective unit was the right to recall representatives which belongs to the rural communities, the trade unions and the military units. In actual practice the recall was used to allow free play to the Communist wire-pullers, who were careful to watch over the orthodoxy of the various soviets. The alternation of functions opened the door to log-rolling and capricious changes of policy. Perhaps the most striking expression of the inanity of these constitutional functions was to be found in the position of the delegates of the Red army, who had to represent simultaneously controlling power in the Executive Council and the "iron discipline" of the Bolshevik regime in the ranks.

Altogether the "Constitution" of the Federal Republic of Soviets was clearly intended to be an instrument for the oppression of the formerly privileged classes and a means of propaganda for the edification of people who want to believe in the benefits of Communist rule. When reproached with the duplicity and the contradictions of this paper arrangement the Bolshevik answers: all derogations from principle are justified by the necessity to fight the counter-revolutionaries and to destroy the bourgeoisie. Pure Communism can be introduced only when the people have been ground into uniform pulp: then Law and the State will disappear of themselves. As long as there is any opposition anywhere dictatorship of the proletariat has to be kept up, and as the mass of the people is not permeated with Communist consciousness the dictatorship can only be constituted by the enlightened minority. Hence the necessity of the rule of the few for the sake of the proletariat. It is interesting to read the justification of the Soviet system on the ground that it makes popular government a reality while parliamentary institutions provide mere fictions:—

"In democracies the only way in which a workman or a peasant participates in government is that he puts a voting paper once in four years in a ballot box. The Soviets are direct organizations of the masses; they are not impermeable, there is the right of recall. . . And this is not only the case with the Soviets which form, as it were, the top of power . . . the organization does not only belong to workmen, it is indeed a working one. In democratic commonwealths the supreme power belongs to parliaments, that is, to talking-

¹ Chap. IV., 7. The Fifth All-Russia Congress of Soviets of Workers', Soldiers' and Peasants' Delegates considers that now, at the decisive moment in the struggle between the workers and their exploiters, there can be no place for the latter on any governing body.

Chap. XIII., 65. The following persons have neither the right to vote nor to be elected:—

(a) Those who employ others for the sake of profit.

(b) Those who live on income not arising from their own work.

² Chap. X., 53.

shops. Power is divided into a legislative and an executive one. The sending of deputies from the workmen to parliament once in four years gives rise to the fiction that workmen share in political work. In truth even the deputies do not share in it, because they talk. The real rulers are the members of a caste,—of a social bureaucracy."

One might think that the rule of Soviets was free from all fictions and substitution of power.

Organization of Supplies and of the Army.—The greater part of the meetings of the Fifth Congress was taken up by the discussion of two topics of primary practical importance—the organization of supplies and the organization of the army. The first of these questions gave rise to a violent conflict between the Bolsheviks and the Social Revolutionaries of the Left. For the latter the socialization of the land was a measure of paramount importance for the future of Russia, and they wanted it carried out with corresponding regularity and deliberation, in conformity with the wishes and the interests of the peasant class as a whole. Spiridonova, the leader of this faction in the Congress, objected strongly to the anarchistic way in which land was grabbed by the peasants, and reproached Lenin with his cynical declaration that as the peasants had seized the land they might divide it as best they could. As a result of this cynical indifference the country-side had been a cockpit in which villagers and householders were arming and fighting for the possession of coveted plots. These rural feuds were not distasteful to the Bolsheviks, who were intent on crushing all well-to-do and thrifty elements of the population as representing the hated bourgeoisie. In practice they wanted corn supplies, knew that some were in the hands of the wealthier peasants and did not find any other means of getting at them but the raising of the poor peasants against the richer ones. The result was the creation of "Committees of the Indigent," whose special purpose was to ascertain who had put by any supplies and to expropriate these "tight-fists." Part of the loot would go to replenish the bins of the Red Government. This was called the "Dictatorship of the Indigent," and Lenin boasted that the Bolsheviks had succeeded in driving a wedge into the compact mass of the peasantry.

The Social Revolutionaries opposed the Bolsheviks in terrorist measures as well as in the case of supplies. In the interval between the Fourth and the Fifth Congresses the Central Executive Committee had founded and organized the "Supreme Revolutionary Tribunal" from its own ranks. The Social Revolutionaries had consented in the beginning to take part in the constitution of this Tribunal, but they seceded from it in connexion with the first trial, when Adml. Shtchaskny had been condemned to death. They protested altogether against the reintroduction of capital punishment, although they did not scruple to participate in bloody repressions of risings and conspiracies. The same difference of opinion reappeared in connexion with the reorganization of the army. Trotsky came to the Congress with a complete programme for the reconstruction of the Red army which amounted to a return to the iron discipline of the ancient regime with a change of provost marshals. "*Où toi de là, que je m'y mette*" was the approved maxim of the time, and, after having preached and agitated for years against the death penalty and other cruel punishments inflicted "by order of the Tsar," Trotsky found it simple and convenient to adopt all these Draconian measures and to employ former officers of the Old Army to enforce them as long as there was not a sufficient number of Red commanders and officers to provide the necessary personnel. The Social Revolutionaries were again true to theory, and denounced this change of front with bitter indignation. Their opponents retorted that it was absurd to reject the death penalty when inflicted by the courts while practising terrorism and shooting people at sight. The Bolsheviks wanted a disciplined army, and were not disposed to be fettered by sentimental considerations or the reproach of inconsistency. These conflicts coincided with the assassination of Count Mirbach and the suppression of a Social Revolutionary rising on Moscow. Bukharin, "The Theory of the Dictatorship," *The October Uprising and the Russian Dictatorship*, pp. 19, 20.

cow: they ended in a disastrous way for the Social Revolutionaries, whose leaders were either shot or imprisoned.

In the interval between the Fifth and the Sixth Congresses the Central Executive Committee had to settle the foundations of two most important sides of social life—the organization of justice and the establishment of school education. Of course legislation in these respects was by no means restricted to the action of the Central Executive Committee in 1918: measures were taken both before and after, but our account must for the sake of convenience be concentrated around the laws and decrees of that year.

Administration of Justice.—Taking first the province of justice, we may notice to begin with the main principle of the Judicature: it is the substitution for the various courts of professional justice of popular courts consisting of three judges—a chairman and two assessors. The first of these was supposed to have some knowledge of legal subjects, though he need not be a trained lawyer; the assessors represent the lay community, and the framers of the new rules give emphatic expression to the wish that the common sense and the practical spirit of the lay members should prevail over technical considerations and a superstitious regard for laws enacted by overthrown governments. They refer with disapprobation to the bad influence of former lawyers who had found their way into the new courts and complicate their decisions by a casuistic treatment of the subject in the old style. The publications of the *Narkomjust* (People's Commissariat of Justice) gave unstinted praise to decisions free from the trammels of juridical dialectic and book-learning. The hope is expressed that the popular courts will open up new avenues of legal thought by the motives and arguments of their decisions and thus create a new and beneficial source of law.

One of the leading representatives of Soviet jurisprudence, Hochberg, compares the position of public and private law in the new system, and comes to the conclusion that the latter is the creation of the bourgeois social order, as it supposes an abstention of judicial authority from interference with the contents of claims and assumes an appearance of impartial indifference. This reminds one of the attitude of Pilate washing his hands, as regards the truth or justice of the verdict. Civil law is decentralizing, anarchistic, derived from a fiction of freedom, while public law aims at concentration and coöperation, and that is the law suitable to a socialistic commonwealth.

Another article on Soviet jurisprudence dwells on the total transformation of criminal law, and the author is not less nihilistic in his appreciation of this branch of legal organization than his colleague Hochberg was as regards private law; indeed, one branch is not more necessary than the other:—

"There can be no idea of retribution, because the modern scientific view does not recognize any free or responsible will. Determinists cannot build their law on the idea of punishment. It is certain that crime is the product of social conditions, and therefore cannot be imputed to any single individual. This being so, there is no reason to despair of the disappearance of crime and of the coercive law directed against it. Menger halted half way: he thought that infringements of rights are to some extent the result of human nature, of inherent self-will. But serious infringements of rights proceed from class distinctions and class antagonisms. There will be no burglary or theft when there is no private property protected by law: all serious motives for homicide and other crimes of violence will disappear when men are all comrades and there is no wealth or privilege to excite hatred. Whatever occasions there may remain for inordinate self-will will be rare anomalies and can be treated as negligible quantities."

In spite of all these enchanting perspectives it is recognized that the stage of a lawless Elysium has not yet been reached, and in concession to human frailty certain prohibitions and rules have to be maintained in the epoch of transition. This epoch may last for a long time, because the new order can be secured only by psychological transformation, and psychological processes take many years to mature.

Meanwhile speculators, traders, hooligans and counter-revolutionary agitators have to be coerced, and this is the chief business of popular courts, reinforced in dangerous cases by the ruthless action of the Extraordinary Commission. Trade was made a punishable offence and threatened with most severe

penalties. According to Clause 1 of the decree on speculation, "a person guilty of selling, storing or keeping with a view to sell, articles of food monopolized by the Commonwealth, if he is doing this as a trade, will be punished by imprisonment for a term not less than ten years with the hardest forced labour, and by confiscation of all his goods." Clause 2 says: "A person guilty of selling, storing or keeping with a view to sell, articles of food at prices higher than the established ones, if he does this as a trade, will be punished by imprisonment for a term of not less than five years, and by the confiscation of all or part of his goods." Clause 3 says: "A person guilty of selling, storing or keeping with a view to sell, other articles the price of which has been fixed and is subject to control, if he does it as a trade, will be punished by imprisonment for a term of not less than three years, etc." Clause 4 says: "If he does not drive a trade (but does so occasionally), he will be punished by imprisonment for a term of not less than six months." Similar penalties are imposed on those who collect provision cards with a view to trade with them.

These Draconian measures were mitigated in practice by the necessity of having recourse to lawyers, who had received their education under the old regime. The majority of the personnel of the higher courts had to be drawn from that class, and did what they could to soften the asperities of Soviet legislation.

In the same way Soviet legislators had to steer a middle course as regards private law; in 1918 law as to marriage, family relations and succession was cast in a new shape. As regards marriage the chief change was the abolition of the contrast between legitimate and illegitimate unions. The only difference was one of registration: some people might think it worth while to register their convention as to sexual relations, others did not attach importance to such routine; the consequences as to family status were about the same. Consorts kept their separate goods and had equally the right of protection and duty of maintenance as to the children. In case of disagreement in the conduct of their children's affairs, they have to apply to the local court. The latter may deprive either of them of the right of supervision in case of misuse. The wife, or woman living as such, may claim maintenance from the man with whom she has been living, if she is unable to maintain herself. As to the bringing up of children, she is allowed to claim assistance from the putative father, and if she has had such relations with several men so that fatherhood is uncertain, she enjoys the additional advantage of being able to claim contributions from each one of them. Succession is abolished. No one can dispose of his fortune by will, nor do the children inherit to the exclusion of other relations; after the death of a person his or her fortune is distributed among relations within certain degrees according to the measure of their needs. Their claims are preferred to the claims of the creditors of the deceased.

It is needless to add that Soviet legislation uprooted the rules as to contract of service. All forms of service are considered as forms of servility, as varieties of exploitation. Everyone must depend on the work of his hands and combination is entirely a matter of public law. It appears in the shape of professional unions—industrial and rural alike, or in the shape of Soviet rule substituted for the old conception of the State. Members of the Soviet Republic are comrades in work, though not in service, and it is for the Soviet Commonwealth to assign them their shares in work and produce.

Here are some characteristic passages from an article in the official organ of the Commissariat of Justice¹:

"The project of the Provisional Government accepted as a basis of the legal order of industrial undertakings the fiction of a free bilateral contract." Under the rule of the Soviets "the industrial undertaking ceases to be governed by formal conventions or contracts and by one-sided declarations of the will of employers. The collective contract . . . loses the character of a bilateral convention and becomes an objective rule of conduct." This principle was first proclaimed as an exception in the case of the establishment of a tariff of remuneration in the metal workers' trade. It was subsequently recognized to be the normal arrangement of the status of

workmen. There can be no more talk of "hire" and "service"; the conception of "cooperation" taking their place. "The sense of duty and of responsibility arising from it has dictated the following clauses to the Petrograd metal workers, when they constituted their tariff without the employers. Clause 16: 'When the working man receives a definite guarantee as to his earnings, he is bound to guarantee a corresponding amount of work in the shape of a definite form of production. Clause 23: In case of evident loafing or of premeditated slowness the workman is to be moved into a lower class and can even be dismissed.' 'The juridical life of the working men is being unified by movements in two directions—towards combining local undertakings into one common State economy and by uniting the interests of separate professional groups on the lines of a common class consciousness.'"

Education and Religion.—Another subject of primary importance considered by the Central Executive Committee in its fifth session in conjunction with trade unions was that of the proletarian school system. There was no discussion, and the conclusions of a committee for which Comrade M. Pokrovsky acted as reporter were approved *en bloc*. The report laid stress on the necessity of getting rid of all varieties in the curriculum of schools, produced by the sinister interests of the dominant class of the old regime. The old schools had been diversified not only by horizontal partitions as lower-middle and high-schools, but also by vertical sub-divisions as special types of humanistic, modern side (*cf. Realschule*), technical, ecclesiastical schools. This tendency towards specialization served the purpose of splitting up the compact and powerful mass of working men into a number of groups on which the dominant class could practice the *divide et impera* principle. The true educational ideal was to train all the youth of the country on the same lines, leading them through the various forms and stages of application of human energy to productive work. A course of nine years, beginning at the age of eight, would be necessary to achieve this object. Of course the old methods by which "gentlefolks'" children were taught to scrawl on paper would have to be discarded. The orientation of the school should be directed towards preparing for a life in which manual work was honoured and not despised. The aim should be to educate men able on leaving school to take up intelligently and successfully any kind of task. The curriculum would be a reproduction on a small scale of the cultural history of mankind.² Astronomy would be shown to have guided the men of old in their observations of the seasons on which agriculture depends; zoölogy would be taught in connexion with the tending of domestic animals, botany on the live specimens of plants. The management of the school should be an introduction to civil life, the principle of collective labour permeating all details, methods of old-fashioned subjection and discipline being entirely discarded, and the school should be constituted as a "commune" and the senior pupils should take part in its administration together with the teachers and the representatives of the working population of the district. Punishments would not be necessary in these educational communes; order would be kept up by the sense of responsibility on the part of the pupils.

A quantity of literature was produced in Soviet Russia to spread the notions of the *Proletcult* (proletarian culture). In order to give an idea of this stuff, one or two extracts may be given from a paper by Comrade Bobrinsky³:

"We have to proceed towards freedom through the iron yoke of proletarian dictatorship, towards equality through rationing according to class, towards fraternity through civil war. Proletarian science becomes in practice a weapon in the struggle for power and economic existence. Science becomes politics. The bourgeois contrast between knowledge and politics, between science and action, gives way a synthesis for the first time: science is turned into the political force of the proletariat, and proletarian politics is turned into science. . . . Natural science is combined into a unity with social science. . . . The old disputes about humanistic (classical) and realistic education, the old criticism directed against the estrangement from life, against the academic character of education find a simple and radical solution in the school of labour. . . . Technology has acquired a place of equality with other sciences and it serves as a transition from natural science to sociology. . . . Technology becomes the principal science in the system of historical materialism. According to historical materialism all changes in

² "The October Upheaval and the Dictatorship of the Proletariat," pp. 163 ff.

social life are derived from the relations of Society to production. Everyone knows that, but it is not sufficiently recognized, that, according to Marx, the evolution of history is entirely dependent on the development of means of production and that changes in the latter are conditioned by changes in technique."

It is appropriate to mention here the policy of the Soviets as regards religion, and, more especially, as regards the Orthodox Church, as its foundations are to be found in a profound contrast of cultural conceptions. The matter is well illustrated in a paper contributed to *The Octobrist Upheaval* by Comrade N. Lukin (Antonov). He begins by ridiculing the notion that the separation of the Church from the State meant emancipation for the Church from secular control coupled with the right to accumulate property and to influence public opinion on similar lines to those which obtain in Belgium. The revolution put religious associations on the same level as other common law associations, but deprived them of the right of holding property and of other privileges of juridical persons. As a natural consequence the Orthodox Church became one of the main instruments of counter-revolutionary agitation. The Council called together in Moscow did not attract any considerable attention on the part of workmen and peasants, but it was crowded with representatives of the old aristocracy, bureaucracy and counter-revolutionary "intelligentsia." The newly elected Patriarch Tikhon excommunicated the authors of the decree of disestablishment and the Council denounced it as an attack on the national faith and the religious institutions of Russia, not omitting to mention that the clergy was being deprived of the means of subsistence. In view of such an irreconcilable attitude the Soviet power is bound to wage a ruthless war against the Orthodox Church. It is armed against it by Clause 5 of the decree of Separation forbidding all ecclesiastical ceremonies and acts directed against the Commonwealth. But it must not be forgotten that even apart from the conspiracies and direct risings, religion in general is antagonistic to the social conceptions of the new order. Even in its present state the Church is able to support ignorance among the mass of the people and to divert the proletariat from the struggle for an "earthly paradise" by making them dream about a "paradise in heaven." The example of France and of America shows that the clergy is preaching war against social democracy with no less fervour because it is deprived of those powerful means of influencing men's brains which are at its disposal in countries still maintaining State religions. In creating a new world the proletariat stands in need of a complete and harmonious scientific outlook.

Foreign and Home Policy.—The Sixth Congress of Soviets met on Nov. 6 1918. Nineteen hundred and fourteen delegates assembled in Moscow, of whom 829 were Communists; 71 had been registered as sympathizing with Communism, and 2 as Revolutionary Communists, while 6 were declared to belong to the Social Revolutionary party, 1 to the Maximalists, 3 to no party. The president Sverdlov expressed his firm conviction that distribution of seats corresponded fully and correctly to the interests of "wide masses of the working population of Russia." The debates were overshadowed by two main facts—by the victory of the Western Allies and by the appalling food crisis.

Lenin, while admitting that the situation was extremely dangerous, because Communist Russia had to reckon henceforth not with two belligerents engaged in a struggle for existence but with the united front of the victorious Entente, thought it augured well for the progress of the world revolution:—

"A complete victory of a Socialist revolution," he said, "is unthinkable in any one country. It requires at least the co-operation of several advanced countries, and Russia is not one of them. This is why the question as to the expansion of the revolution into other lands and of our success in repulsing imperialism becomes one of the principal problems of the Revolution. . . . We must raise the proletariat of all countries."

He dwelt on the benefits conferred by the Brest Litovsk peace, which gave Russia breathing-space and the possibility of reconstructing her army. Now the aim was to carry the contagion of the revolution into Central and Western Europe:—

"We can see already how the fire has broken out in most countries—in America, in Germany, in England. . . . The peace which

the rapacious imperialists of England and France are going to inflict on conquered Europe will be a more humiliating and crushing one than the treaty of Brest Litovsk, but this very peace will be their undoing, because it will rouse the revolutionary feelings of the world proletariat. We are not living in Central Africa but in civilized countries in the twentieth century. They are raising a Chinese wall against Bolshevism, but Bolshevism will pass the wall and spread its infection among the working men of all countries."

In unison with Lenin, the president, Sverdlov, declared that before six months had passed they would see Soviet rule triumphant not only in Hungary, in Germany, in Austria, but in France and Great Britain.

The problem of supplies was to be solved by expropriation in the villages. Zinoviev explained that the plan of raising the poor peasants against the well-to-do ones was being carried out with energy and success. A Congress of the "poor folk" in Petrograd had been attended by 16,000 delegates; they had resolved to organize a special "poor folk" army consisting of two men from each village. In the Novgorod Government alone 2,000 "poor folk" committees had been formed:—

"Their chief aim is to drive a wedge into village life . . . to kindle class struggle, to kindle the sacred hatred of the poor folk against the rich. . . . We say . . . the 'tight-fists' must be strangled as we said before: strangle the bourgeois in the towns. . . . We know perfectly well that we cannot carry out a proletarian revolution unless we crush the 'tight-fists' in the villages—crush them in the economic and, if necessary, in the physical sense."

The Congress adopted a resolution in conformity with Zinoviev's proposal, the gist of which was that in order to get rid of strife and confusion produced by dualism in the villages it was necessary to assign to the "poor folk committees" instituted by the decree of July 11 1918, the superior authority and to carry out a reorganization of rural Soviets on the pattern of town Soviets, turning them into true organs of Soviet power.

The seventh Congress met on Dec. 5 1919. Of the 1,109 delegates with power to vote, 890 were registered as Communists and 34 as belonging to no party. In the course of the Congress some representatives of the Social Revolutionaries and Mensheviks (Dan, Martov and others) took part in the debates, declaring their adherence to the cause of the Socialist Republic under Soviet rule, but criticizing certain methods of Soviet administration. The atmosphere of the Congress was dominated by the elated feelings produced by the victories over Kolchak and Denikin. They were extolled as triumphs over the Entente. Lenin admitted in his speech that the progress of the World Revolution had been slower and more complicated than had been expected, but he maintained that on the whole the provisions of the Bolsheviks had been justified by the course of events. The miracle of the victory of helpless and backward Russia over the all-powerful Entente was traced by him to the instinctive sympathy of the working-classes of Great Britain, France and Italy towards their brothers in Russia. As a result of this feeling it was impossible for the Allies to expose their troops to a decisive conflict with the Red army; symptoms of fraternization had begun to appear in the ranks of the western soldiers and the Entente was obliged to withdraw them. The hope to combine the minor border states against Red Russia had also miscarried, and disillusionment had been brought by the collapse of the White Guards equipped by the "imperialistic wild beasts" of England whose greed and craving for world supremacy was worse than that of the Germans. Resolutions of the Soviet greeted the toiling masses in all countries, invited them to struggle against bourgeois Imperialism and declared the Peace of Versailles a shameless attempt to establish the domination of the Allies, to divide the world into conquerors and conquered, into great and small powers, without taking heed of self-determination.

Trotsky gave a glowing account of the victorious Red army. He described it as an exact reflection of the Soviet Republic. It was built up on the principle of class domination, the ruling class being that of town workmen:—

"They form about 15-18% of the army, but they lead it on account of their greater consciousness, their stronger solidarity, the higher quality of their revolutionary mettle. The responsible posts of commissars are occupied almost exclusively by workers of the

Communist party. In every regiment, every battalion, every company is to be found a communistic cell. In this way a new communistic order of 'Samurai' has been formed. And the army is not merely a fighting organization, it is a political school the like of which has not been known to the world."

Trotsky prided himself particularly on the incessant political propaganda. "In the beginning we had not a single elementary school in the army—now we have 3,800; before the 1st of Jan. we had 32 clubs: now we have 1,315. Before the 1st of Jan. we had not a single mobile library: now we have 3,392."

As regards officers and other specialists drafted into the Red army from the cadres of the old Tsarist army, Trotsky maintained that thousands of them had reconciled themselves with their new position and were faithfully serving the new order. He was contemplating the institution of one man's rule instead of the system of commanders watched over by two commissars.

Economic Problems.—The most serious discussions took place in connexion with the problems of food and fuel-supplies. Tsurupa, the People's Commissar at the head of the *Narkhokom* (the Commissariat of People's economics) gave an account of the working of bread monopoly. All corn supplies had been nationalized and the system was enforced by charging each province with a fixed contribution which was subsequently distributed among the districts of each province, while the districts assessed the villages with *quotas* according to estimation. The whole assessment of the country was reckoned at 324 million poods of corn of every kind: of the 30% which were charged to the first quarter some 60 millions were expected to come in by Dec. 1. This did not quite correspond to the demand, but as some provinces were not under the control of the Soviet power, the assessment might be said to have been carried out satisfactorily in the greater part of the country as regards corn. This did not mean, however, that the supply of corn was secured for those who needed it. Many thousands of poods lay stored and rotting at the stations, because there was no transport to convey them to their places of destination. As regards meat the situation was much worse. Only 600,000 poods were available instead of the five million delivered in 1918; the cause was the great falling off of the numbers of cattle held by the peasants. Butter and fats were also at a discount: the commissariat could not dispose of more than 300,000 poods for the whole of Russia, and that meant famine in respect of fats. Of fish roughly 75% of the normal supply had been caught but the transport conditions were badly hampering its distribution. The proposal of the Commissariat was to extend the State monopoly and the coercive assessment to all food products and it was adopted by the Congress.

As far as fuel was concerned, the situation had grown to be catastrophic. The loss of Baku and of the Donets coal-mines had largely reduced the quantity available. Instead of 500,000,000 poods of naphtha, e.g. Soviet Russia disposed of 80 million. It continued to exist only because all private stores and supplies had been confiscated. Things got better when the roads to the Donets and to Ural were cleared, but the disorganization of the transport told heavily on the distribution of fuel. As a matter of necessity Russia had to fall back once more on wood fuel, although the adaptation to a new system of heating involved immense losses. The first requirement was to provide material for the railways and that was being gradually achieved by means of labour conscription. As for domestic heating, its needs were so great that the only way of solving the problem was to cut down timber in the neighbourhood of cities, and Moscow, for example, was being served by means of the clearing of timber in an area of 18-30 square versts. The Commissariat was obliged to engage the services of private contractors and agents in order to get the required supplies. When, in discussion, fanatical Communists reproached Commissar Rykov with this deviation from the recognized principles of communism, he answered that there was no other way of collecting the timber and that, after all, the Extraordinary Commission was able to proceed against speculators and profiteers. In other words, the Soviet administrators might enable men to enrich themselves by private enterprise and then prosecute them on account of their gains.

Comrade Sofronov reported on the constructive work of the Soviet; this work had proceeded from the top to the bottom and

the administration of the country had assumed the shape of parallel columns subordinated to "heads" and "centres," each managing its own concerns, but with little connexion between them and often with opposed views on kindred subjects. The *Narkomjus* (People's Commissariat of Justice), for example, was not in agreement with the arbitrary terrorism of the Extraordinary Commission, but was powerless to influence or to restrict it, because it was acting within the column of the Home Commissariat, and no solution could be found for the difference between judicial and administrative tribunals.

The discussion gave rise to attacks on the bureaucratic centralization and the suppression of freedom by the communistic dictatorship. The reporter Sofronov admitted that there was a tendency towards one man's rule in all branches of the organization, but such a tendency, explicable in the course of civil war, could not be conceded as a principle. It did not check the complete anarchy of economic and legal relations produced by the lack of harmony in administration. It ought to be corrected by a reform of elections, which would regenerate the local Soviets and thus create a basis for political reorganization at the top. An essential condition for such a reform was the removal of counter-revolutionary elements. Therefore the electoral law ought to be supplemented by stringent enactments not only disfranchising the "tight-fists," but making it a punishable offence for them to take part in any electoral or other meeting in the village.

Lenin came forward to defend the policy of Soviet rule against the reproach of anti-democratic tendency:—

"We do not promise," he said, "that our constitution guarantees freedom and equality in general. Freedom—but it must be pointed out for what class and for what ends. Equality—but who shall be equal and with whom?—for those who work and who have been exploited in the course of centuries by the bourgeoisie, who are fighting the bourgeoisie even now. This has been stated in the constitution: the dictatorship of the workmen and of the poorest peasants in order to suppress the bourgeoisie."

These ideas were more fully developed in Lenin's speech to the Congress of School Extension workers (May 6 1919):—

"It cannot be gainsaid that freedom is a powerful catchword for any revolution, democratic or socialistic. But our programme declares: freedom, if it obstructs the emancipation of labour from the oppression of capital, is a fraud. Any one of you who has read Marx, or even popular accounts of Marx, knows that he devoted the greater part of his life to ridiculing freedom and equality, the will of the majority and all the Benthamites who commented on these things in glowing terms. He proved that at the back of all these phrases lay the interests of free trade, the freedom of free capital, which are used to oppress the workers. . . . We maintain that to grant freedom of meetings to the capitalists would be the greatest crime—it means freedom of meetings for counter-revolutionaries. We say to the bourgeois intellectuals, to the adherents of democracy: 'You lie when you reproach us with the infringement of freedom. When your great bourgeois revolutionists of 1649 in England and of 1792-3 in France carried through their revolutions they did not concede to the monarchists the freedom of meetings. The French Revolution was called the Great one because it was not like the weakly phrase-making revolution of 1848: after overthrowing the monarchists it crushed them out of existence. . . . The peasant is a hybrid being: half a workman and half a speculator. This is a fact from which you cannot escape, unless you destroy money, destroy exchange. And to do that you want long years of firm domination of the proletariat, because it is only the proletariat that can conquer the bourgeoisie.' When we are told 'you have broken equality not only as against exploiters (a social revolutionary or a Menshevik might admit that), but you have broken equality as between workmen and peasants, you have broken the equality of toiling democracy, you are criminals,' we answer: 'Yes, we have broken the equality between workmen and peasants and we maintain that you, who defend this equality, are followers of Kolchak.' . . . We ask you: 'the ruined workmen of a ruined country, in which factories are at a standstill, would they be right to submit to a majority of peasants, who do not yield to them the surplus of their corn? Have they the right to take this surplus by violence if it is impossible to do so in any other way?' The peasants are a special class: as toilers they are the enemies of capital, but at the same time they are proprietors. The peasant has been taught during centuries to consider the corn as his own, and that he is free to sell it. It is my right, thinks the peasant, because it is my labour, my sweat and my blood. It is not easy to change his psychology: it will take a difficult and long process to do so. He who imagines that the transition to socialism will be effected by one man convincing another, and this other a third, etc., is at best a child, or a political hypocrite. You can, if you have luck, smash an institution at one blow: it is

impossible to smash a habit, whatever your luck. We have given the land to the peasant, freed him from the squire, thrown off all his fetters, and yet he goes on thinking that liberty is free trade in corn, and serfdom the duty to surrender the surplus at a fixed price."

The Eighth Congress of the Soviets.—The Eighth Congress of All-Russian Soviets was convened at Moscow on Dec. 23 1920. Approximately 80% of the delegates were members of the Communist party, the remaining 20% were not affiliated to any party. It was known that with reference to certain questions of policy there was an important divergence of views among leading Communists. These differences of opinion were especially marked in connexion with (1) economic reconstruction, including the question of concessions to foreigners, and (2) the demobilization of the army. Lenin was at the head of the so-called Right Wing, while the Left was under the leadership of Bukharin. The disillusionment of many Communists concerning Soviet administration was expressed in strong terms at the Congress. These criticisms were summarized and by one of the leaders, Osainsky, in an article which contains the following passage:—

"For three years, the Soviet Government has seriously turned aside from the principles of proletarian democracy, and from the spirit of the Soviet Constitution. On the one hand, there have been created two legislative bodies, not provided by our constitution—the Council of Defence and the Military Revolutionary Council; on the other all constitutional organs (legislative as well as executive) have virtually disappeared. The eclipse of the Central Executive Committee is generally known. But even the Council of People's Commissars and the Council of Defence, which have ostensibly replaced the Central Executive Committee, have been, in their turn, eclipsed by still another body. In reality, the centre of political leadership has been shifted to the Central Committee of the Communist party, and even here to a smaller body, the 'Political Bureau' of this committee. Legislative measures, diplomatic acts, and military plans decided by this 'Politik-Bureau' are formally sanctioned and issued in the name either of the People's Commissars or the Council of Defence." (*The New Statesman*, 1921, p. 635.)

The Congress decided to establish Provincial Economic Conferences which should be charged with the unification of all purely local economic institutions. Meetings were to be held no less than twice a month, and the persons who were to participate in the proposed Conferences were to be designated by the Supreme Economic Council, the Commissariats of Supplies, Labour, Finance, etc. All local branches or institutions of the Supreme Economic Council in the various provinces were to be subordinated to these Provincial Councils, with the exception of so-called "principal" industries, such as important metal factories, mines, etc., which still remained directly subordinate to the Supreme Economic Council.

The number of members of the Central Executive Committee was increased to 300 and sessions were to be held at least twice a month. The managing board of the Central Executive Council was given power to cancel any decisions of the Soviet of People's Commissars. All conflicts or disagreements between the People's Commissars and Central Institutions on one side, and the local Executive Committees on the other, were to be referred to and decided by the managing board of the Central Executive Committee. All decrees and regulations of general importance, including laws, military decisions and questions of foreign policy, were to be examined by and were subject to confirmation by the Soviet of People's Commissars. The Congress considered that the Soviet of Labour and Defence which had been created at the height of struggle between the republic and an Imperialistic world (Nov. 30 1918), should be reformed so as to form a committee of the Soviet of People's Commissars. An appeal was addressed to the peasants asking them to support the republic by contributing all their surplus agricultural produce to assist the Commonwealth. Trotsky favoured a partial demobilization of the regular army and the organization of a militia.

These were the principal decisions of the Congress. The general attitude of the Communist party was best expressed in speeches delivered by Lenin and by Zinoviev. Lenin welcomed the establishment of Soviet Republics in Bukhara, Azerbaidjan and Armenia, as showing that the Soviet system was acceptable, not only in industrial countries, but also in agricultural lands. It was hoped that a treaty would shortly be signed with Persia.

Relations were being cemented between the Soviet Government and Afghanistan and Turkey. Lenin defended the policy of granting concessions to foreign capitalists. It would be ridiculous to talk of Russia's economic independence while the Soviet Republic remained a backward country. Guarantees would be demanded from those who received concessions and it was essential that everything should be done to promote trade relations without delay. He reminded his audience that a long series of wars had hitherto decided the fate of the revolution. They must prepare for the next chapter in this history:—

Without economic restoration they would be unable to hold their own. To achieve this economic aim it would be necessary to unite compulsion with moral suasion as successfully as they had been united in the Red army. Russia was a State of small farmers and the transition to communism was hampered by difficulties greater than those which would have arisen in other conditions. For the attainment of their economic objects the assistance of the peasants was ten times more necessary than it had been during the war. The peasants were not Socialists. The Communist workers "must tell the peasants that it was impossible to continue freezing and dying of starvation indefinitely." If such conditions continued they would be defeated in the next chapter of the war. There must be a larger area of land under cultivation next spring, and there was no hope of salvation unless this economic victory was obtained. They recognized their obligation to the peasants. They had taken their bread in exchange for paper-money. They would compensate them as soon as industry was restored. The menace of Russia to the capitalist world could not be maintained without an improvement of economic life. As long as she remained a small farmers' country capitalism would find more favourable acceptance than Communism. The foundation and basis of their home enemy (capitalism) has not been removed. Electrification would help them to remove it.

Zinoviev admitted that the Soviet regime was degenerating through the influence of an immense and inefficient bureaucracy. He laid the blame on the traditions of the old administration:—

The utilization of bourgeois specialists in the work of economic and administrative reconstruction was absolutely essential and inevitable. The worst feature of this recourse to specialists was that they exhibit a red-tape attitude towards their work, not entering into the spirit of it: they have brought the worst habits of Government lethargy and bourgeois bureaucracy into our administrative organs. Those workers and peasants, whom the Soviet Government drew into direct participation in the Government, although they saw the weak side of these specialists, were themselves powerless to raise affairs to a higher level. Thus a wrong attitude was taken up toward those who worked by brain and not by hand. Workers who stand at the lathe are regarded as useful members of society, but what about the man who counts the lathes, who works out plans of production, who carries out essential statistical work? Such men are sometimes contemptuously described as bureaucrats.

The workers' and peasants' control must be transformed from an organ of supervision over the activity of Government institutions into an organization for attracting broad masses of the workers and the peasants to administrative tasks, for inculcating the methods of administration in accordance with the decree of the All-Russian Executive Committee dated Feb. 7 1920.

RUSSIA IN 1920-1

Soviet Russia had shrunk considerably by 1921 in comparison with the former Russian Empire. Instead of a population of some 180 millions it comprised in 1921 about 130 millions, of whom 10 millions were peasants and the rest were divided among the townsfolk and the nomadic and hunting tribes of the eastern steppes and of Siberia. It is estimated that the country lost 1,700,000 killed in the course of the World War, but it is impossible to form even an approximate conception of the number of those who perished from the indirect effects of the war through wounds, ill-health and privations, and of those who were destroyed by the massacres of the civil war, the misery of retreats and migrations, the epidemics of typhus, cholera, diphtheria which claimed a heavy toll in the unsanitary conditions of life. It would hardly be an exaggeration to put the number of victims of these disorders at some 10 millions. The abnormal increase of the death-rate has been definitely registered in certain cases, and there is good reason to suppose that in all centres where people congregated for political or economic reasons exceptional mortality prevailed and the health of the population was enfeebled through starvation and sickness. Petrograd, with 2,250,000 inhabitants in 1914, had been reduced to some 700,000, and Moscow to 1,000,000 instead of 1,800,000.

But, undoubtedly, the greatest inroads had been made by the separation of large territories that had acquired political independence. Finland accounts for a diminution of 3,000,000; Poland for 11,000,000; Estonia and Latvia for 3,000,000; Lithuania for 5,000,000; Georgia, Armenia and Azerbaijan for 8,000,000; Bessarabia for 3,000,000, the districts of White Russia and Volhynia, ceded to Poland, for 3,000,000.

Economic Disruption.—The great combination for economic intercourse guaranteed by the empire had been broken up to the detriment of most of its component parts. Of course, from the point of view of national separatism, the political independence of Estonia or Latvia was a great conquest, a glorious assertion of self-determination, and a source of profit in the helpless condition of Russia. These Baltic States serve as a kind of neutral fringe in which Bolsheviks can be met in safety by representatives of western Powers and western commerce. Gold from the Russian State reserves was being stored there, Reval and Riga serving as outlets for whatever trade was conducted with the west by the bankrupt Government of Moscow. Undoubtedly such a position, recognized by Europe and at the same time highly useful to the Soviet, might be a lucrative one. But these new-born States hardly realized sufficiently that sooner or later an account would have to be rendered to a Russia restored to its national traditions and strength. Such a historical Russia would hardly consent to leave the gates of the Baltic in the hands of alien Governments, who had done their level best to thwart its efforts at restoration in 1919, who manifested on every occasion their hostility to the Russian people and were in more dangerous proximity to Petrograd than Ireland was to London. The Bolsheviks had no objection to using Lettish mercenaries for repressing popular risings in Russia, and Lettish stockbrokers for commercial dealings with the west, but the Russian Government could not be expected to remain anti-national for ever. In the case of Poland the necessities of the industrial situation are quite as obvious as those of the commercial one. Polish industry thrived on the economic connexion with Russia. Without the Russian market Poland is economically a lifeless strip of territory: Germany does not want Polish manufactures; the only commodity it did want from Poland was cheap labour, but recent occurrences in Silesia and elsewhere show to what an extent national animosities have obstructed intercourse, even in this respect. It will be a long time before Poland will be able to use the outlet to the sea for the purpose of considerable trade and it is not likely to become ever a sea-power of some standing. In the meantime Poland in 1921 was practically bankrupt, with its currency enormously depreciated. It would certainly not seek reunion with Russia, but it might regret the opportunity it had in 1919 for helping in the restoration of a national government in Russia. Lithuania, with its unhappy situation in the intersection of the lines of action of three powerful neighbours—Germany, Poland and Russia—had to keep up a front primarily against the Poles as its most dangerous neighbours. As German protection was excluded by the policy of the Entente and especially of France, it seemed certain that the Lithuanians would sooner or later have to lean on Russia. But it would have to be a Russia with a civilized Government and a solid national basis. As for Rumania, the seizure of Bessarabia, though confirmed by decree of the Entente Powers, and the wholesale dispossession of Russian landowners, had not pacified the province, of which half the population belonged to the Russian stock and in which even many Moldavians were reputed Russophiles. The alliance between Rumania and Poland, concluded in the spring of 1921, might serve the purpose against a possible Bolshevik offensive, but would hardly help against a reconstituted National State. In the Caucasus again, the various alien nationalities are so intermixed and so hostile to each other that it was impossible to expect the rise of any local federation or even of durable peace: the Armenians, the Georgians, the Caucasian Tartars, as soon as they were free of their movements, were inclined to jump at each other's throats, and the necessity of a strong empire holding their appetites for self-determination in check was recognized even in 1921: it formed the background of the Soviet Govern-

ments artificially created in Azerbaijan, in Georgia and in Armenia. The factor of economic interdependence was also clearly to the fore: Georgians normally hate Armenians, though the rural population of Georgian stock wants the coöperation of the Armenians in the towns. The Tartars would fain swoop down on the people in the plains, and have repeatedly tried to do so, but after a time the necessity of drawing supplies from peaceful agriculturists and traders asserts itself among them. The oil treasures of Baku are of paramount importance to any Russian State and on the other hand these oil wells cannot be exploited without drawing supplies from a "Hinterland" furnishing food and manufactured articles. Above all, these regions can reckon on peaceful development only if there is a strong police force to keep the heterogeneous elements in order. Such a force could only be provided under existing conditions by Russia. Even the Bolsheviks had found access to this disturbed region as negotiators and pacifiers although their methods of pacification were of a peculiar kind—mainly the extermination or driving out of elements opposed to the Soviets.

On the whole there could be no doubt in 1921 that anti-Russian tendencies and political arrangements found their chief support in the absurdity of Bolshevik rule as well as from a recollection of the oppressive policy of the Tsarist period. A change for the better in the direction of freedom and democracy in Russia would render it possible to restore to some degree the economic and political ties which rendered fruitful the coöperation between these interdependent elements. As things stood, Soviet Russia was in 1921 deprived of important commercial outlets and industrial auxiliaries, and had to pay a proportionate price for such help as she could get from them.

Commercial Intercourse.—The curtailment of these resources was, however, of small importance when compared with the misrule of the Communist authorities in Russia proper. As a result of the civil war, of the proscription of trade, of the destruction of the middle classes, of the ruin of currency and credit, the processes of circulation had been impeded and blocked to such an extent that one had to look back to the Mongol invasions in order to find anything similar in magnitude to the misery of the situation up to the middle of 1921. The struggles in the Ukraine, with the repeated changes of rulers (democratic Ukrainians, the German protectorate, Petlura's bands, Bolsheviks, Denikin's White Guards, the Bolsheviks again, a Polish invasion, the Bolsheviks again), and the accompanying sequence of risings and punitive expeditions had made the south-western granary of the black soil almost unavailable for years to come. In the same way the Donets basin, the Cossack territories, the Volga provinces had been the scene of bitter conflicts and disturbances which had affected their productivity in a most unfavourable way.¹

In 1921 one could hardly talk of a Russian railway system. It was already worn out to a great extent by the war and rendered useless for the bulk of the population by the strain put on it by military exigencies. The Soviet administration had been trying hard to effect the most urgent repairs as to rails, engines and trucks, and had utilized a considerable part of the gold reserve to buy locomotives and rolling-stock abroad. But the needs were so great and the engineering resources of Russia had fallen so low, that there was no marked improvement in this respect.

The restrictions as to trade had been relaxed lately, by the decrees of March 29 and May 17 1921, and a lame attempt had been made to revive trade, but all these concessions were too much in contradiction with other standing features of Communist policy to produce an extensive change in the situation. The fact

¹ Production of coal in the Donets basin for the first four months of 1913, 1919 and 1920 (in thousands of poods).

Months	1913	1919	1920
January	143,000	36,600	14,000
February	117,000	34,800	19,300
March	156,000	33,300	24,300
April	84,000	12,500	13,800
Total	500,000	117,200	71,400

(Report of Lord Emmott's Committee.)

remained that the dictatorship of the Soviets had employed itself systematically on cutting the connecting nerves of the economic organism and had thereby produced a state of paralysis which it was out of question to heal by a few decrees.

One of the hateful consequences of this self-inflicted disorder was the severance between town and country. The rise and the growth of towns depend directly on ways of communication and the circulation of men and goods. They are primarily centres of distribution and exchange, and if the roads to them are obstructed they are unable to perform their economic functions of distribution and exchange. There was, of course, a secondary cause to their decay in "Sovdepiia," namely the fact that they were centres of industry and affected by the ruin. But their decay as centres of commerce was bound in itself to produce a back flow of the population towards the villages. Such a back flow was especially indicated in Russia, where the distinction between rural and urban life was never a very marked one, and where large numbers of the inhabitants, such as cabmen, carriers, porters, small tradesmen, were recruited from the villages for a time and accustomed to return to their rural homes at certain periods of the year. In "Sovdepiia" this mixed population tried to escape from the deadening grip of the Bolsheviks in the towns to the rural districts. It could live a freer life there, and, besides, it was nearer to the direct source of food-stuffs—the tilled soil. In this way the economic evolution of "Sovdepiia" might be described as a regress from commercial to natural husbandry.

Another side of this process of "naturalization" was connected with the disappearance of the mainspring of flourishing commerce—credit. The causes of this phenomenon are partly of an economic and partly of a political nature. As the whole system of Communism is based on war against capital, no accumulation of wealth or resources should be allowed in private hands. This being so, no transactions can be carried out in the strength of confidence in a person's ability to meet engagements in the future. Cash payments and (in view of the worthless currency) barter are the only legitimate forms of exchange. To this must be added the effect produced by arbitrary expropriations by the renunciation of State liabilities, at home and abroad, by the absence of any legal security against dispossession. In such conditions there can be no talk of prosperous economic intercourse. Not the market but the barrack is the social center.

The will of a people to live cannot be entirely extinguished even by a Communist regime. Practice reacts by all conceivable means against the theory. Clandestine trade had been going on in Russia all through the years 1918-21. The Sukharevka market in Moscow teemed with people bidding all kinds of goods for sale. Those who succeeded in getting a passage by rail or by river-craft carried little stores of merchandise in sacks, ostensibly for their own use, in reality for trade purposes. What prices such contraband goods fetched was another matter: people had to pay fantastic sums for the risks incurred by the traders, besides making up for the depreciation of the currency. Anyhow the flow of speculation had never ceased in spite of all the decrees of the Soviet, and the rulers had recently made up their mind to recognize the existence and to admit in half-hearted way the legality of local trade (March 1921). This was proclaimed in the west as a great victory of common sense over extremist doctrine: it was in truth an inevitable admission which did not do away with the main causes of the disorder—insecurity, disruption of communications, distrust, corrupt and arbitrary interference by the commissars. As long as these causes continued to operate, the economic life of Russia would be suffering from their cumulative effects, and the social intercourse of the country was bound to be disturbed by the fever of fraudulent and rapacious profiteering in an atmosphere of misery and disease.

Agriculture.—State of Peasantry.—One of the first decrees of the Bolsheviks proclaimed the abolition of private property and the nationalization of the land. In practice this decree sanctioned the disorderly grabbing of estates by the adjoining peasantry, and the new rulers connived at this form of appropriation for the sake of its psychological effect as a revolutionary act. This meant that they renounced "nationalization" at the same time

as they professed to carry it out, and although they tried to save their face by distinguishing between the ownership attributed to the republic and the possession of land snatched by the peasants, the fact remained that the October Revolution as translated into agrarian terms meant the passage of some 50 million dessiatins (135 million ac.) from former landowners into the hands of "petty bourgeois" of the peasant class. The fact that some of the new proprietors held in village groups while others held in individual homesteads did not alter the fundamental opposition between the two social conceptions. The history of the years of Soviet domination up to July 1921 showed that the Communists did not realize at once the consequences of the agrarian revolution registered by their decree. They strove to carry out their programme of nationalization in two directions: they kept in the hands of the Commonwealth a considerable number of estates which had belonged to the State, the Imperial family and certain private landowners—they based their policy of food supply on the principle that the peasants were tenants at will of the republic liable to unlimited exactions for the benefit of the whole.

Under the first head a series of measures were adopted for the exploitation of estates on communistic principles. In the peculiar terminology of the Soviet a number of "Sovkhoses" and "Kolkhoses" were carved out of the land fund and put under the economic control of the administration. The "Sovkhoses" were economic organizations carried on under the immediate direction of the Government while the "Kolkhoses" were communes and associations of peasants enjoying economic support from the Government. Sovkhoses either carried on agriculture in general or cultivated special kinds of technical plants such as beetroot or tobacco. In the first case the Sovkhoses were mainly organized as colonies of industrial workers fitted out with agricultural implements of all kinds, cattle, seeds, etc. The object was to make town workers more independent of the "yoke" of the villages by giving them the opportunity of growing their own corn and vegetables, managing their own dairy farms, etc. These annexes of the factories, designed to rear privileged proletarians in a healthy atmosphere of occasional rural occupation and to provide the surrounding villages with examples of model farming, proved a dismal failure. According to a report presented to a congress of agricultural workers in July 1920 the delays and red tape of administrative patronage rendered the condition of the proletarian husbandmen exceedingly precarious.¹ And as for the workers it could not be expected that they would be able to give satisfaction in their amphibious pursuits. The progress of the Kolkhoses was not more successful. Some were started as actual "communes" with individual coöperation and individual "profits," and those were doomed to be a failure; other Kolkhoses merely drew assistance from the Government, and had to encounter the hostility of neighbouring, less-privileged villages. The negative results of this experiment may be gauged from the fact that the number of Kolkhoses in action decreased in one year from 1,900 to 1,500.

The immense area covered by peasant tenures on the old lines was little affected in its constitution by the Bolshevik usurpation. The attempt of the Soviet to bait the well-to-do peasants by the needy folk proved that the Communist intellectuals did not know the material with which they had to deal. There was no "village proletariat" to speak of, which could serve as a basis for the intended subversion of social relations in the villages; and such tramps and drunkards as the Bolsheviks were able to bring together in their crusade against welfare and order did not succeed in effecting much more than occasional disturbances, which ended mostly in the suppression of the "needy folk" by the peasantry.

¹ According to the decree of June 8 1919, the control of the Sovkhoses farms was given to the Glavsemkhose (the Central Board of Agriculture), which (1) united all agricultural farms organized by the industrial proletariat; and (2) united all the central boards controlling those branches of industry which were in need of agricultural plants for their production, such as "Glavskhar," "Glavtabak," "Glavkrachmal," "Centrochai," and "Pharmacentre" (*Economic Life* Oct. 2 1919). The original area allotted to different industrial boards amounted to 200,000 dess. (540,000 ac.), but the area actually distributed amongst them was much smaller, amounting only to 80,000 dess. (*Russian Economist*, Jan. 1921).

Much more irksome were the requisitions and expropriations exercised in virtue of the eminent ownership of the Commonwealth. The Soviet was constrained to fall back on this means of extracting some supplies for feeding the army and the towns, but the decrees enjoining the confiscation of the entire produce with the exception of the quantity necessary for the subsistence of the husbandmen, could not fail to provoke a stubborn resistance. The answer of the peasantry was that the farmers restricted the area under seed to the extent necessary to feed them and their families. Why should they toil to increase cultivation if the fruits of their labour were to be taken from them? According to a Soviet authority (Larin) the quantity used for cultivation had shrunk from 5 milliard poods in 1917 to 2½ milliard poods in 1920. The Soviet Government brought all the weight of its terroristic coercion to bear against this passive resistance. It sent punitive expeditions, it encouraged its privileged proletarians to raid the countryside for supplies, it issued a decree ordering the maximum of available soil to be taken over in cultivation and threatening recalcitrant farmers with confiscation and imprisonment; all in vain as far as the general results were concerned. The hardships and disorder were increased hundredfold, but it proved impossible to drive a mass of 100,000,000 peasants by the whip to perform work which was distasteful to them.

The Soviet dictators had to acknowledge their defeat, and in the spring of 1921 (on March 23), in view of a threatening famine, a decree was issued by the Executive Council of the Soviet recognizing and guaranteeing the private tenure of householders who would conform to the payment of a tax in kind. Instead of charging the provinces with certain lump sums to be partitioned among the *uyezds* (districts) and, lower down among the *volosts*, and to be collected from the harvest according to the requirements of the Government, a land tax was imposed which had to be assessed according to the outfit and means of each separate household. It was calculated that this substitution of a land tax for the system of repartition amounted to the reduction from 470,000,000 poods of corn to 240,000,000. It remained to be seen whether the business of assessing and collecting the tax could be carried out with sufficient skill and fairness. The one positive asset of the revolutionary period from the point of view of the peasants consisted in the passage of land from the squires to the tillers, and this was certainly a conquest which the villagers were not going to give up. All attempts at political reconstruction would have to reckon with this basic fact.

Industry.—The history of industrial economy presents the same features, and describes the same curve, from partial disorganization through blockade and war to general ruin in consequence of absurd Utopianism, and, ultimately, to desperate attempts to reconstitute production by reverting to methods condemned and destroyed by the Communists. There is, however, a notable difference: while the enormous block of the rural population was able to oppose unconquerable passive resistance to the dictators in spite of terrorism and heavy losses, the scanty stratum of the industrial workers was almost worn out in the struggle.

We have again to start in our survey in the case from the years immediately preceding the Revolution. Bolshevik experiments were the culminating phase of a process of destruction which had started long before the Oct. 1917 upheaval: the guilt of the Communists consisted in the fact that instead of fighting the evil, they did everything in their power to aggravate it. The initial stage of industrial decay dates from the time when Russia was isolated from western resources by the Central Powers in alliance with Turkey and Bulgaria. The country had to attempt the impossible task of providing by its own primitive resources for the tremendous technical requirements of the war. The criminal levity of Tsarist administration under men like Sukhomlinov had left it with exhausted equipment and munitions by the end of some nine months of military operations, and an unsolvable problem was set to its patriotic leaders in 1915; they had to make up the deficiencies and to prepare further efforts. This meant technically that all the coal and all the railway machinery had to be diverted for the use of the army while the economic needs of the population were entirely disregarded. As a result, though,

with the help of Zemstvo and Municipal Committees acting for purposes of national defence, the fabrication of shells and machine-guns was to some extent reestablished and maintained, the economic work in the rear necessary for production and repairs was rapidly deteriorating. Train service, for example, was officially suspended for weeks between Petrograd and Moscow in order to make room for military transport and the most urgent needs of food supply. Repairs of locomotives had to be carried out in a more and more imperfect and insufficient manner, and the statistics as to the state of rolling-stock presented drastic symptoms of a lamentable deterioration. The March 1917 Revolution accentuated all these evils because another cause of decay came to the fore with ever-increasing force: the discontent and the demoralization of the workers broke out like a stream of all-consuming lava. The responsibility for the sufferings of the time was laid entirely at the door of greedy capitalists, and the workers were convinced that they were justified in demanding increased wages and decreased labour. A Minister of Labour of the Provisional Government, Skobelev, upheld emphatically their contention.

The following tables give illustrations of the change in the condition of the rolling stock:—

Engines.

Year	Length of the Lines, in Versts	Number of sound Locomotives	Percent. of Locomotives out of order	Number of sound Locomotives per 100 Versts of Line
1914	64,000	17,000	15-16	27-28
1916	65,000	16,000-16,800	16-17	26-27
1917, Jan.	64,526	17,012	16.5	26
June	62,952	15,930	24.2	25

Construction of New Engines.

Year	Number of new Engines constructed in Russia
1914	816
1915	903
1916	599
1917	396
1918	191
1919	85

In the cotton industry of the Moscow district the earnings of skilled and unskilled workmen per day was as follows:—

Date	Unskilled workers		Carpenters of the first category	
	In kopeks	Per cent. 1919 = 100	In kopeks	Per cent. 1919 = 100
Easter 1914	46	2	155	3.9
Easter 1915	57	2.5	160	4.0
Dec. 1915	59	2.6	175	4.4
Easter 1916	68	3.0	200	5.0
Jan. 1917	68	3.0	250	6.2
Aug. 1917	145	6.3	575	14.4
Dec. 1917	800	34.8	1,950	48.7
June 1918	1,000	43.5	2,050	51.2
Sept. 1918	1,000	65.2	2,650	66.2
Feb. 1919	2,300	100	4,000	100

All partial attempts to put a stop to constant rioting, absenteeism, and slackness availed nothing against the general intoxication of the "glorious revolutionary days."

Working Year of the Industrial Workmen in Days.

	Pre-revo- lutionary	Post-revo- lutionary	Increase since the Revolution	Per cent of Increase
Stoppages		53	53	157
Sickness	7.4	19	11.6	
Absence for other causes	16.6	52	35.4	214
Total of days absent	24	124	100	416
Days of rest	93	55	38	41
Days of work	248	180		
Total	365	365		

The table shows that, notwithstanding the large decrease in the number of holidays after the Revolution, the working year of the workman, owing to the increase of sickness, absence from work and stoppages, has decreased by 68 days, or 25%; and if, further, the length of the working day be taken into account, in 1916, including overtime 10.1 hours, and at the beginning of 1920, 8.6 hours, then the decrease of the working year amounts to 900 hours or 30 per cent.

The Bolshevik victory in Oct. 1917 added yet another ingredient to the industrial ferment. The Marxist dictators, the industrial workers, were the chosen class, the leaders of the proletariat, and entitled therefore to carve out benefits and indulgences for themselves according to their own notions of right and expediency. More especially they were keen to ransom the employers' class, not only by appropriating the lion's share in actual profits but by exacting compensation for advantages which had accrued to employers in the past, as well as vengeance for ill-treatment of the workers in the course of centuries. The inference from this conception of economic relations between working men and their former employers was the system of *workers' control*¹ which the Soviets started in their industrial policy. It meant that each factory and workshop had to be conducted in the future under the supervision and according to the directions of a board of workmen, while the employers were degraded to the position of technical experts and banking managers.

The object of the peculiar combination between Capitalism and Socialism designated as "workers' control" was avowedly to enable the workmen to draw on the resources of the capitalist to the last drop, and in this complete success was achieved thanks to the servitude imposed on the "employer" who could neither withdraw nor oppose any decree of the workman's board. But the system had yet another effect, namely a complete industrial anarchy and consequent ruin.

The next stage was reached when the Soviets attempted to put an end to this anarchy by a regime of nationalization.²

¹ The Workers' Control was established by the decree of Nov. 14 1917. It directed the production, sale and storage of products and of raw materials and the administration of the financial side of the business. It belonged to all workers by the intermediary of their elected institutions with the participation of representatives of the employees and of the technical staff.

The situation in the factories became chaotic, and the disorganization of the undertakings assumed the most extraordinary dimensions. The interference of the Workers' Committees made it quite impossible to realize any scheme planned in advance. All programmes of economical policy were annulled by the "judgment" of the Workers' Committees.

² In the course of a report delivered to the Moscow Congress by the Supreme Council of People's Economy in Jan. 1920, A. I. Rykov, the president of the Council, made the following statement: "The nationalization of industry has been carried out pretty fully. In 1918, 1,125 factories and works were nationalized, and by the end of 1919 the number was about 4,000. This means that nearly all industry has passed into the hands of the state (Soviet) organs, while private industry has been destroyed, as former statistics show that there were up to 10,000 industrial undertakings, including cottage industries. These latter are not subject to nationalization, and the 4,000 nationalized factories and works include not only the larger concerns, but likewise the bulk of the average industrial concerns of Soviet Russia. Of these 4,000 undertakings about 2,000 are working at present. All the rest have been closed. The number of operatives is estimated approximately at 1,000,000, which is between one-third and one-fifth of the numbers of the proletariat in 1914. Both as regards the number of hands and the number of undertakings in operation the Russian manufacturing industry is likewise undergoing a crisis."

Nationalization could be introduced into practice only by deriving economic direction and control, not from the accidental and separate groups of workmen in factories and workshops, but from the national centre. This centre was embodied in the Economic Council of the people, supported locally by subordinate councils in the provinces and districts, and relying for the execution of its decrees on a vast bureaucracy of head offices (Glaski) and "centres."

It is difficult to form an adequate opinion as to the ramifications and numbers of this all-embracing bureaucracy. We have the evidence of its own members as to the actual working of the system. In theory it had to organize the repartition of raw materials, to assign means and draw supplies and to collect products in accordance with requirements. In reality the Soviet bureaucrats struggled with each other, stifled local opinion and individual enterprise, and had generally to record lamentable discrepancies between plans and achievements.³

Bureaucratic nationalization proved as ineffectual as workmen's control in solving the problems of increased production and organization of labour. Theoretically, the workmen in the nationalized industries had to be considered not as privileged beneficiaries but as disciplined citizens serving the Commonwealth. Attempts to translate this view into practice were made. Workmen were mobilized for industrial purposes, sent to the Ural or to the Donets fronts, subjected to military control and martial law, armies that had been fighting the Poles or Denikin were switched off to execute economic tasks. Trotsky developed the idea of the militarization of industry as the only means of saving the country from collapse. But the results were not encouraging. Workmen deserted from the towns and hid in the villages, while those unfortunates who were unable to leave Petrograd, or other industrial towns, went on strike, made demonstrations and riots in the face of ruthless repressions; even when they performed their hard labour, it proved miserably inadequate for lack of physical health and moral energy.

Altogether, industrial nationalization proved as much of a failure as agricultural nationalization. And so the Soviets had to retreat, here as there, to a position characterized by the abandonment of all their economic doctrines and previsions. In 1921 Comrade Krassin was recommending in the West a programme that Lenin had announced to the 10th Congress of Communists and to the Central Executive Council: capital and competent leadership were acknowledged as necessary forces in the process of industrial production: the national capitalists had been robbed and driven from Russia; therefore foreign capitalists had to be called in to take their place. They were promised guarantees against arbitrary expropriation "*à la Russe*" and they might think that they were less liable to succumb to it because they were not "comrades" but citizens of civilized states, and might count on the strong arm of their Governments. But the great inducement consisted obviously in the prospect of rapid profiteering on a scale commensurate with the risk incurred by those who ventured into the wolves' den.

In comparison with these gigantic schemes of exploitation other retrograde measures were modest and mild. Small capitalists, even when Russians, were allowed to start shops, and individual enterprise was to be encouraged somehow, although Communism was not renounced as an ideal, and big undertakings were to be kept in the hands of the State. The introduction of

³ From Jan. to June 1918, the Soviet regime at the Putiloff factory gave the following results:—

	Delivered	Provision
Engines, new	2	4
Engines, new type	1	3
Engines, important repairs	2	10
Engines, medial repairs	0	12
Carriages, 3rd class, new	2	4
Carriages, 4th class, new	3	13
Carriages, for goods, new	169	309
Tramways	3	9

The real productivity of the factory is from 3 to 10 times inferior to those of the scheme of production established by the superior Council of National Economy. (Report of Mr. Molotov to the Petrograd Soviet, Aug. 15 1918, Labry, 187.)

specialists was recommended as a necessary measure. Under the regime of the workmen's control, technical experts were treated as second-rate persons to be ordered about by the ignorant "demos" of proletarian boards, but experts were now invited to proceed to Sovdepa in order to help to restart productive industrial activity. In the factories piece-work was given a prominent place as against the "ca'canny" devices of time work, although previously workmen used to protest most violently against this form of remuneration. Altogether payment by results was being more and more recognized as an antidote against slovenly labour. As for working hours no account was taken of the 8-hour day, and forced labour was exacted for 10 or 12 hours when deemed necessary by the commissars.

Standard of Living.—Thus the Soviet dictators were trying in 1921 to back out of the impasse into which they had run the industry of the country. There was among the working class one group which had profited by the Oct. revolution—it was the communistic nucleus used by the Soviet administration to spy on their comrades and to coerce them. They enjoyed all the privileges of an official class and could afford not only necessities of life but such luxuries as were to be had in the market. Apart from these privileged Communists the working class was reduced to a condition of utter destitution. Even judging by the standard of the prices fixed from time to time by the ruling powers they could not make the two ends meet, because the prices had risen during Soviet domination from 16 to 25 times. In 1921 bread cost 10 times as much as in the second quarter of 1917, manufactured goods 22 times as much, footwear and soap 25 times. Wages indeed had increased also, but their nominal increase did not keep up with the cost of living. About the middle of 1918 an *enquête* had been made in Moscow as to the budgets of 2,173 workmen, and it resulted from it that on the average a bachelor working-man's wages did not exceed 462 rubles per month, though by occasional extra work they might be brought up to 624. The head of a family earned on the average 703 rubles, and might increase his earning by supplementary labour to 1,077 rubles per month. The ordinary budget was made up in the case of a bachelor by 22.2 rubles for lodging, 46.9 for food, 47.7 for clothing, 1.1 for house implements, 19.6 for health (baths, drugs, etc.), 13.4 cultural expenses (newspapers, books, etc.), 13 (parcels sent to village home), 32 miscellaneous expenses; in all, including other items, being 609 r. For heads of families the average monthly expenses rose to 952.7, of which 672.8 r. fell on food (Zagorsky, *La République des Soviets*, 214, 215). These figures show a considerable deficit in normal and well-regulated households: any disturbance in personal conduct, conditions of labour or health, was bound to result in downright starvation and ruin. Let us also notice that distress was much more marked in 1920 and 1921 than in 1918.

The only consolation for workmen was derived from the fact that the hated bourgeois were subjected to even greater hardships. In the early stages of Bolshevik domination this kind of consolation was a potent one: the feeling of triumph of the lower class over its former superiors made up for many privations, but in course of time the bourgeois were trodden down to that extent that there was not much satisfaction to be obtained from kicking them, while new contrasts arose between the mode of life of half-starved workers and of the Soviet bureaucrats shepherding them. The food situation became catastrophic in 1921. As a result of the restriction of cultivation, transport difficulties and civil disorder, a great part of the country was visited by downright famine, with terrible prospects ahead.

Credit and Finance.—In such conditions nothing could be expected but growing decay in public credit and finance. The Soviet Government had been living on the reserves accumulated under monarchical rule. The gold fund of the Imperial Treasury had been its chief asset in conducting political and commercial negotiations. Its remnant represented something like £50,000,000 in the first quarter of 1921. The needs of the home circulation were satisfied by constant emissions of paper notes. There was no system and no limit in this process of inflation. Paper notes had even come to be measured by weight instead of being

reckoned at their indicated value. The Chief of the Soviet State often spoke with contempt of money currency as a worthless product of capitalistic exploitation. But the Communist Commonwealth had not yet discovered the means of replacing this system by a more adequate instrument of exchange. Figures in rubles were still being handled as if they represented realities. The only hope left for the Bolsheviks was that when they had spent the reserves captured from the Imperial Government and from the defeated armies, the national capital represented by the natural wealth of Russia in forests, minerals, fisheries, etc., should be put into the market. The handing over of this wealth to foreigners would mean, of course, economic subjection, a state similar to that of Asiatic and African dependencies of western Powers. But the Bolsheviks were not deterred by a prospect of that kind, provided it enabled them to continue in power. They mapped out a programme of concessions on the widest scale.

The Council of the Commissars of the people laid down a set of rules as to concessions, and the Councils of Economy and of Agriculture outlined a vast scheme of natural resources which should be offered to foreigners for exploitation. The rules were as follows:—

- (1) Concessions should be granted by agreement on the principle of a division of profits.
- (2) In case of the introduction of special machinery and appliances the concessionnaires would be granted privileges, e.g. large orders.
- (3) The concessionnaires would be allowed to remain in possession for long periods in order that they should draw sufficient benefits from their concessions.
- (4) The Government of the Soviets guaranteed immunity to the concessionnaires from nationalization, confiscation and requisitions.
- (5) The concessionnaires would have the right to hire labourers on conditions specified in the Laws of the Commonwealth or on special conditions safeguarding the life and the health of the workmen.
- (6) The Government pledged itself not to make any change in the conditions of the agreement by a one-sided exercise of its authority.

It would be impossible to enumerate all the resources of the country offered to enterprising capitalists for exploitation. Two or three examples must suffice to give an idea of the booty offered to foreign capitalists by Russian Communists. In Western Siberia, along the rivers Ob, Irtysh and Taz, an area of 70 million des. (about 180 million ac.) was reserved for them. It is covered by immense forests of pines, firs, cedars and larches. If it were found necessary at the start to restrict exploitation to a strip along the rivers some 15 versts wide along each bank, there would still be available for immediate and easy use some 16 million des. (about 42 million acres). The timber should be sawed and worked into pulp and cellulose in mills to be erected by the estuary of the Ob. Such mills ought to make up a settlement of the size of another Archangel. The natural route westwards lies down the Ob and by the Kara sea: it had already been utilized to some extent and its future importance could not be exaggerated. The whole region should be opened up by a number of railway lines. Mineral wealth of various kinds—platinum, coal, lead—is to be found in these districts. One of the most stupendous advertisements as to mineral wealth concerned the Kuznetsk coal mines along the Tom river. They were estimated to contain about 250 million tons of excellent coal. In European Russia 14 uyezds (districts) were advertised for agricultural exploitation and the construction of ways of communications of all kinds. All these districts are situated in the black soil region of south-eastern Russia. The application of powerful traction engines and steam ploughs would soon convert them into one of the principal granaries of Europe.

Such were the prospects held out in 1921 to enterprising capitalists. Not a word was wasted on the social and legal conditions of the human material connected with these tracts. It remained for the concessionnaires to fashion it with the assistance of the enlightened commissars: it was evident that the 5th clause of the Soviet rules ought not to be applied in such a way as to hamper the great process of economic restoration. The principal object was to get capitalists to speculate on the material basis described with such graphic details.

It remained to be seen how they would organize and keep in order the labouring population required for the carrying out of

the concessions—whether the foreign capitalists would obtain feudal franchises with police powers of their own, or the Soviet power would keep watch on their behalf and use coercive measures to keep the Russian workmen up to the mark.

Another side of the repressive policy of the Soviets in the stress of dire need was presented by the appeal to the help of coöperatives. These organizations had gone through a chequered existence under the rule of the Soviets. In the early days of 1917 and 1918, the proletarian dictators used them as convenient tools at home and abroad in order to counteract the impression that Russia was ruled by an uncompromising despotism. The leaders of the coöperatives were encouraged to preach a non-party attitude, and to concentrate their efforts on purely economic work without any admixture of political opposition. In the campaign for the reopening of trade with Soviet Russia it was usual to assert that such trade would be carried on exclusively with coöperators and not with the ill-famed Moscow Government. In 1919, however, a sharp turn was given to the wheel, and the coöperatives were "nationalized"—declared to be subordinate committees of the Central Economic Council. In Sovdepaia this measure was explained not only as a consequence of the general policy of Communism, but also as a necessary precaution against Social revolutionaries and Mensheviks, accused of having barricaded themselves within the coöperatives for purposes of political agitation.

In the beginning of the year 1921 a new current set in: coöperatives were to some extent reëstablished as autonomous organizations. The object was to revive them as agents of repatriation. The Soviet decree of April 7 1921 was drawn up, however, in such a narrow and ambiguous form, that the institution remained doomed to mechanical subjection. The Act concerned primarily coöperatives of consumers. It allows combinations for protection and traffic only in an exceptional case and in obscure terms. As far as allowed, coöperatives are included in administrative units of state origin and local delimitation. All freedom of action is curtailed and subjected to strict supervision. Lastly, the members are not voluntary associates intending to help each other according to free agreement, but people brought together by the fact of dwelling in the same locality or belonging to the same professional group.

All this shows to what extent the principle of autonomous association was felt to be antagonistic to Soviet despotism. It might be assumed that the coöperatives would either remain inactive and fictitious, or else that they would contrive to escape the jealous supervision and the step-motherly pressure exercised by the "Glavki" and "centres."

The hard facts of economic decay admitted of no controversy and could be illustrated by tabulated results. It was still impossible in 1921 to apply the same tests to the moral aspect of the condition of Russia, although there could be no doubt that the deterioration of national life in this respect was more harmful than economic decay. The aggressive tone of Communist propaganda could not deceive any one who considered the efforts of the "Proletcult" with common sense. It was not the number of schools that mattered, but their efficiency and educational influence. The prophecy of Dostoevsky in *The Possessed* had come true: the Bolsheviks had not only squandered the reserves accumulated by orderly government, and scattered some 2,000,000 of the best educated Russians across the world—they had poisoned the mainsprings of national morals for generations to come. One or two of the conclusions of Lord Emmott's Committee may be appropriately cited in this connexion; their studied moderation makes them particularly effective:—

"Child education in Soviet Russia is based upon an attempt to dissolve the ties hitherto existing between parent and child, and children are removed from the care of their parents soon after birth; we have received no information on the moral and physical effects of this policy. Education, both child and adult, is not merely secular, but directly anti-religious in bias."

As a specimen of the educational practice of Soviet Russia we will quote from the experience of a leading professor of the medical faculty of the university of Moscow, published under the

pseudonym of "Donskry" in the *Archives of the Russian Revolution*, I (Berlin, 1921):—

"By order of the commissars 5,000 applicants had been admitted as freshmen in the medical faculty, although the lecture-rooms were constructed for 250. Representations had been made that it was impossible to admit persons who had received no appropriate instruction, but they were disregarded. The only thing required was that applicants should have attained the age of 16 years—the rules as to admission did not mention even the necessity of knowing how to read and write. The crowd of students dwindled to small numbers very soon, however, on account of the absence of heating during the winter and of the almost insuperable difficulty in getting materials for experimental teaching."

RUSSKY, NIKOLAI (1854-1918), Russian general, was born in 1854. On leaving the infantry military school in St. Petersburg in 1874 he was given a commission in the Guard. Graduating from the Academy of the General Staff in 1881, he served as an officer of the general staff in the Kiev military district, and by 1896, after commanding an infantry regiment, had reached general's rank. During the war with Japan in 1904-5 he was the head of the staff of the II. Army, and planned the offensive carried out by Gen. Gripenberg which led to the prematurely abandoned offensive of Sandepu. In 1909 he was assistant commander of the Kiev military district. He enjoyed the special friendship of the War Minister, Sukhomlinov. At the beginning of the campaign of 1914 he commanded the III. Army, which attacked in Galicia, and after the vicissitudes of the bloody heavy battles about Krasnik and Rava Ruska advanced to Lvov (Lemberg), through which it passed in the further advance to the San-Dniester line. The dramatic entry of the III. Army into Lvov created for Gen. Russky a popularity and prestige out of proportion to the real importance of his success. In Oct. 1914 he was appointed commander-in-chief of the north-western and afterwards of the northern "front" (i.e. group of armies), but, suffering from very bad health, he had on more than one occasion to leave the front for a time. He continued, however, to hold the command, and it was at his headquarters that the final scenes of Nicholas II.'s reign and his abdication took place in March 1917. Soon after the Revolution Russky retired and in 1918 he was reported killed by the Bolsheviks.

RUTHERFORD, SIR ERNEST (1871—), British physicist, was born at Nelson, New Zealand, on Aug. 30 1871. He was educated at Nelson College and Canterbury College, Christchurch. After graduating at the New Zealand University (M.A. 1893 and B.Sc. 1894), he proceeded with an 1851 science exhibition to Cambridge, where he entered Trinity College and prosecuted researches in the Cavendish laboratory, Sir J. J. Thomson being then the Cavendish professor. He published numerous researches upon the conduction of electricity through gases, for which he obtained the B.A. Research degree and the Coutts-Trotter studentship in 1897. In the following year he was appointed Macdonald professor of physics in McGill University, Montreal. There he carried out a series of brilliant investigations, in conjunction with Soddy, which established upon a firm basis the existence and nature of radioactive transformations. In 1903 he was elected F.R.S. In 1907 he succeeded Sir Arthur Schuster as Langworthy professor of physics in the university of Manchester, and he attracted there a large school of radioactive research workers. In collaboration with several of these the science of radioactivity was rapidly developed: among other work the production of helium as a product of disintegration of radium was shown spectroscopically, the spectrum of the emanation measured, the number of α particles (charged helium atoms) during a disintegration process counted, the properties of numerous radioactive products and the radiations accompanying their formation examined. Among the most important of the researches emanating from his laboratory was that of the experimental demonstration of the nuclear nature of the atom. It was also in his laboratory that Moseley determined the X-ray spectra of a number of elements. Rutherford was knighted in 1914 and in 1919 succeeded Sir J. J. Thomson as Cavendish professor of experimental physics in the university of Cambridge. Many British and foreign honours and degrees were bestowed upon him: the Rumford Medal of the Royal Society (1905), the Barnard Medal (1910), Bressa Prize (1908), and Nobel Prize for chemistry (1908). In 1920 he was appointed professor of physics at the Royal Institution, London. His works include *Radioactivity* (1904), *Radioactive Transformations* (1906), *Radioactive Substances and their Radiations* (1912).

RUTHERFORD, MARK [WILLIAM HALE WHITE] (c. 1830–1913), English author (see 23.940), died at Groombridge March 14 1913. His eldest son, SIR WILLIAM HALE WHITE (b. 1857), who was created K.B.E. in 1919, became a well-known physician, and during the World War was a colonel in the R.A.M.C.

RYAN, JOHN DENIS (1864—), American capitalist, was born at Hancock, Mich., Oct. 20 1864. He was educated in the public schools, for eight years was clerk in an uncle's store, and at the age of 25 went to Denver, where he was employed as a salesman of lubricating oils. In 1901 he secured an interest in a bank at Butte. In 1904 he was made manager of the Amalgamated Copper Co. in Montana, and after the death of Henry H. Rogers, in 1908, he succeeded him as president. He had been elected president of the Anaconda Copper Mining Co. in 1905, and after the merging of the Amalgamated interests in the Anaconda in 1910 he continued as president of the latter until 1918. He developed large water powers in Montana, and in 1912 electrified the railway between Butte and Anaconda (100 m.), the success of which led to a wide introduction of electrification. By 1920 hydroelectric power from the Montana Power Co. organized by Ryan was used in most of the mines of Montana and for lighting in all parts of the state. During 1917–8 Ryan was a member of the war council of the American Red Cross and after 1918 of its central committee. After the failure of America's aircraft programme had led to a reorganization, he was appointed in April 1918 head of the Aircraft Board of the Committee of National Defence, and in Aug. was appointed second assistant-secretary of war and director of air service of the U.S. army. After the signing of the Armistice in Nov. he resigned. Official investigation was made later, and Ryan was both attacked and defended. It was generally felt that the newly organized board fell heir to popular criticism of past failures for which it was not responsible, and the short time before the Armistice scarcely afforded opportunity to develop efficient production. In 1920 Ryan was elected chairman of the board of directors of the Anaconda Copper Mining Company, and he took a prominent part in connexion with other commercial and financial concerns.

RYDER, ALBERT PINKHAM (1847–1917), American painter (see 23.949), died at Elmhurst, Long Island, March 28 1917.

SAAR VALLEY.—The Armistice of Nov. 1918, in restoring Alsace-Lorraine to France, again brought the French frontier close to Saarbrück and the Valley of the Saar. This region, thanks to its large coal output, had ever since 1871 been in close relations with the coal-mines of Metz and Thionville. The big metallurgical establishments of Lorraine were largely dependent upon coal from the Valley of the Saar, from which the new French frontier would have cut them off, to the detriment of the economic development of both countries. On the other hand, France had been deprived of a large portion of her output by the destruction of her northern coal-fields, a situation which had as far as possible to be remedied by Germany. The geographical situation of the coal-mines in the neighbourhood of Saarbrück clearly pointed to their utilization for this purpose. Nevertheless, and although Saarbrück had belonged to France from 1794 to 1815, the French annexation of this country was difficult without running a risk of violating the inhabitants' right of self-determination. These were the elements of the problem which the authors of the Treaty of Versailles had to consider.

Treaty Stipulations.—Section IV. of Part III. of the Treaty deals with the Saar Valley. Articles 45 to 50 lay down the frontiers of the Saar territory, and state the general principles adopted. The regime agreed upon is laid out in an annexe which follows Article 50. It is clear from the text that the authors of the Treaty intended to cede to France complete ownership of all coal deposits in the valley. This could not have been effected had the district remained under the authority of the German Government. Disturbances were to be feared between the French State, sole proprietor of the mines, and the German Government, which would have remained the only public authority. In order to get over this difficulty, and to ensure to France the free disposal of Saar coal, the territory of the Saar was completely detached from the German State, both from a political as well as from an administrative point of view.

Frontiers.—The territory (see EUROPE, inset on map) as created by the Treaty stretches W., N. and E. of the town of Saarbrück (60 km. E.N.E. of Metz, and 90 km. N.W. of Strassburg). On the S. and the W. there is the French frontier, from Hornbach, S. of Deuxponts, to Ritzing, W. of Merzich (Merzig). Leaving Ritzing, the frontier includes Mettlach and its suburbs, passes near Neuenkirchen, and, going E. reaches the southern frontier of the Birkenfeld district, which it follows. From Namborn the line goes S.E., taking in Homburg, and, after bending so as to exclude Deuxponts, rejoins the French frontier near Hornbach. The territory thus formed is considerably larger than the district where coal-mines are actually being worked. The peace negotiators intended, in fact, to include in it the whole coal deposit, and not only the fields being exploited. France has become sole owner of all the fields and of all mining concessions. Indemnification of the former owners was made the concern of Germany. Transfer to France of the mines being worked was made comparatively easy by the fact that nearly all the concessions belonged to the State of Prussia or to Bavaria. The rights of France in the district were still further guaranteed by the inclusion of the district in the French Customs system. This provision had extremely important economic and political effects. However, in order to avoid a brutal cessation of the close economic relations which existed between the Saar and the rest of Germany, trade with Germany was to remain free of any Customs dues until Jan. 10 1925. France was empowered to build any railways or canals which she might deem necessary in order to link up the fields with France. All the rights and duties of the former proprietors towards their employees and workmen were assumed by France, who was also free to use French currency in all its transactions within the zone. The value of the mines thus ceded was to be added to Germany in the Reparations Accounts.

Steps had to be taken to provide the dis-

trict with administration and government, France, apart from the mines, being concerned only with Customs. The Peace Treaty entrusted the League of Nations with this task, as from Jan. 10 1920. The country is governed by a commission of five, which sits at Saarbrück, and consists of one French member, one member chosen among the local population, and three who may be neither French nor German. This commission is appointed yearly by the League of Nations, which may renew expiring mandates. It is presided over by one of its number, appointed by the League of Nations. This president acts as executive agent. All powers previously enjoyed by the German Empire, Prussia and Bavaria have been transferred to the commission. The commission maintains in force the laws and regulations passed previous to the Armistice, with the exception of special war measures. It has the power to modify them if necessary; collects taxes; administers justice; directs the administration of the country, and can create new administrative organs. It is responsible for public order; the safety of the inhabitants of the district, and their representation abroad; it manages the railways and looks after all public property. These powers, for the use of which the commission is responsible to the League of Nations, are subject to several restrictions. First of all, they cannot affect the rights of the French State in its capacity as owner of the mines, and no restriction can be placed upon the circulation of French money. On the other hand, the country maintains its local assemblies, its religious freedom and its tongue. No fresh taxation (Customs excepted) can be levied without consultation with elected representatives of the inhabitants. Men and women over 20 years of age have the right to vote for the local assemblies.

The Treaty in no way affects the existing nationality of the inhabitants. It stipulates that the governing commission shall be the last judge of any dispute arising from the interpretation of the Treaty itself. The régime thus formed does not establish a state of the Saar, similar to that of Luxembourg, since no new nationality is formed, and since the League of Nations is only acting as trustee. It is none the less true that the Saar territory constitutes a political and economic entity entirely independent and entirely separated from Germany and France. The Peace Treaty did not intend to prolong this state of affairs indefinitely without giving the inhabitants of the Saar an opportunity of expressing and obtaining the fulfilment of their wishes in the matter. Therefore, 15 years after the coming into force of the Treaty, that is to say, in the course of the year 1935, the future régime of the Saar was to be settled by a plebiscite.

The Plebiscite.—The details of this plebiscite were to be settled by the League of Nations. All persons over 20 years of age who were resident in the territory on June 28 1919 were to have the right to vote. Three alternatives were to be submitted to the population. First, the permanent maintenance of the system of government provided for in the Treaty—that is to say, autonomous government under the ægis of the League of Nations; second, reunion with France; third, reunion with Germany. Voting was to be taken by commune or by district, and it would therefore be possible to take into account the various votes of different portions of the territory. The League of Nations was to fix the new frontiers, if any, in accordance with the results of the plebiscite. The fate of the mines ceded to France would be decided by the plebiscite also. If the Peace Treaty régime were continued, or if the voting went for reunion with France, there would be no further difficulty; but if all or part of the coal-fields returned to Germany, Germany would have to buy out the interests of the French State in the fields which Germany would then reoccupy. The price was to be fixed by experts and to be payable in gold.

Physical Features.—The river Saar comes into contact with the territory at Sarreguemines, and forms the French frontier to a point just above Saarbrück. It then flows through the territory to a point just downstream from Mettlach. The valley, which, between Saarbrück and Merzich, is fairly wide, runs through picturesque hills covered for the larger part with forests, the working of which is a

valuable industry. Agriculture plays but a very secondary part, and it is upon industry that the population is mainly dependent. The pop. amounts to 703,000, which, on an area of 1,900 sq. km., shows a density of 370 persons per sq. km. The population is very unevenly distributed. It is very dense in the industrial regions, in the valley around mineheads, and wherever factories have been built. It is sparse in the farm and forest lands. The chief towns are Saarbrück (110,000), Voeltingen (19,000), Sarrelouis (16,000), Dillingen (8,000), Merzich (9,000), which are all in the valley itself. Then there are the mining towns elsewhere: Dudweiler (21,000), Sulzbach (23,000), Friedrichsthal (14,000), and the industrial town of Neuenkirchen (35,000). The chief towns in the Bavarian portion of the territory are St. Ingbert (19,000), Homburg and Blieskastel. The chief industry, and the only one mentioned in the Peace Treaty, is the extraction of coal. The mines being worked in 1921 are situated in a district bounded on the one side by the Saar Valley from Burbach to Fraulautern, and by two lines drawn from Waldmohr (N.E. of Neuenkirchen) to Burbach and Fraulautern. Mines are most closely clustered in the little valleys between Saarbrück and Neuenkirchen, and before the war all of them, with the exception of those at Hostenbach and Frankenholz, belonged to Prussia or Bavaria. The total production of the basin averaged 12,000,000 tons a year. It exceeded 13,000,000 tons in 1913, and, in the opinion of experts, a very considerable increase in output ought to be obtained without much difficulty. All the mines are worked for France, with the exception of that of Frankenholz, which was left in the hands of the company which previously owned it. Output fell off during the war, as the result of fewer working hours and less productive labour. In 1920 about 9,500,000 tons were produced, and in 1921 the output would have been bigger had it not been for the general economic crisis. The mines employ over 70,000 persons, and, taking into account their dependents, it may be safely said that about a third of the total population of the country relies upon the mines for its living. The output is consumed, to the extent of about 50% locally. The rest is exported to Alsace-Lorraine, France and Southern Germany. The export market varies in accordance with the general economic situation. The coal is not very satisfactory for the purposes of steel manufacture, and has to be mixed with coal from the Ruhr before it produces good coke. On the other hand, it is very suitable for heating and the manufacture of lighting gas, and therefore finds a ready sale to railways and municipal authorities. Metallurgical industry is highly developed, and there are no less than 31 blast-furnaces and many steel plants. The factories, which are run by powerful companies, are situated at Burbach, Brebach, Voeltingen, Dillingen, Neuenkirchen and St. Ingbert. The steel output in 1912 was over 2,000,000 tons. Since the Armistice French capital has been largely invested in the metal industries of the Saar and metal workers and miners receive their wages in francs. There are a number of works producing machines and machine tools, so that after coal the iron and steel trades rank as second in importance. Glass and ceramic industries, the former at Sulzbach and St. Ingbert, and the latter at Mettlach and Merzich, are the next important employers of labour. There are over 120,000 persons, counting 70,000 miners, industrially employed. The majority of the workmen are natives of the country, and labour therefore has a stability not often to be found.

Communications.—A good system of communications provides an outlet for these industrial products. Saarbrück is at the junction of the Metz-Mayence and Strassburg-Trèves-Cologne line, and is also on a direct line towards Ludwigshafen and the Rhine, as well as in connexion with a number of minor or local railways. There is also a canal through the Saar, which has been canalized upstream from Sarrelouis in order to meet the mine canal and the Marne-Rhine canal in Lorraine. There is no waterway towards the Moselle.

General Considerations.—It will be seen that the population is almost entirely industrial. In the towns there are wholesale and retail dealers, and the works and factories are owned by big limited companies. There is therefore but a small middle class and a backward intellectual and artistic development. From a religious point of view Catholics are in a considerable majority, although there is a fairly strong group of Protestants at Saarbrück. Since the German revolution the Socialists and Catholic Centre have been practically numerically equal; and trades unions are either Christian or Red. It is economic questions, output and wages which chiefly concern people. In 1921 there were a number of problems to which no definite solution had been found. There were the change of the Customs frontier, the coexistence in the Saar of the French franc (with its higher and more stable rate of exchange) and the German mark, and the natural increase of economic relations with France. The great resources of the country, however, enabled one to hope that the Saar would be able to adapt itself to these new conditions. The stipulations of the Treaty of Peace, in placing the territory under the authority of a government independent both of France and of Germany, were peculiarly calculated to assist the economic development of the region. They gave to the Saar the means of protecting its own interests, and at the same time spared it the burdens and worries which are the common fate of all great states. (P. DE T.)

SABINE, WALLACE CLEMENT WARE (1868-1919), American educator, was born at Richwood, O., June 13 1868. He graduated

from Ohio State University in 1886 at the age of 18 and after two years' further study at Harvard received the degree of A.M. In 1889 he was made assistant in physics at Harvard and the following year instructor. After passing through the usual stages of promotion he was appointed professor of mathematics and natural philosophy in 1905 and the following year assumed the deanship of the newly organized Graduate School of Applied Science. He was an inspiring teacher but his publications were confined to papers contributed to scientific journals. In 1916 he went to France as exchange professor at the Sorbonne but devoted most of his time to removing French tuberculous patients to Switzerland under the auspices of the Rockefeller Foundation. In 1917, however, he lectured on architectural acoustics, a subject of which he had made a special study. He himself fell a victim to tuberculosis and died in Cambridge, Mass., Jan. 20 1919.

SAGE, MRS. RUSSELL (MARGARET OLIVIA SLOCUM) (1828-1918), American philanthropist, was born at Syracuse, N.Y., Sept. 8 1828, being descended on her father's side from Capt. Miles Standish. After graduating in 1847 from the Troy (N.Y.) Female Seminary, afterwards known as the Emma Willard School, she taught, first in Philadelphia, and later in Syracuse and Troy until 1869 when she became the second wife of Russell Sage (see 23.1002). She proved herself a shrewd business woman and for several years before his death had full control of his affairs. She had long been interested in charities, and in estimating the services of Sage himself it should be remembered that he left to her without restriction his entire fortune, over \$64,000,000, doubtless foreseeing its probable final distribution to charity. In 1907 the Russell Sage Foundation was incorporated under the laws of the state of New York, for the "improvement of social and living conditions of the United States of America," and to it she gave \$10,000,000. The Foundation made many surveys of social and educational conditions in various states and issued many publications dealing especially with housing improvement and reform. In 1912 Mrs. Sage bought Marsh I., off the Louisiana coast, containing about 70,000 ac., later turned over to the state as a permanent refuge for birds. She died in New York City Nov. 4 1918. Her will provided that after enumerated bequests to relatives and friends amounting to about \$12,000,000, the residue, some \$36,000,000, should be divided into 52 parts and variously distributed to many colleges, museums, hospitals, charitable institutions, Bible societies and missions. To most of these she had made gifts during her lifetime. The largest portion, seven parts, was left to the Russell Sage Foundation. It was estimated that during her life she had made public gifts of some \$40,000,000.

SAID, HALIM, PRINCE (1859-1921), Turkish statesman, was born at Cairo in 1859, a nephew of the Khedive Ismail. He was a keen politician, and became the official head of the Young Turk party, which carried out the revolution of 1908. He was called upon by Sultan Mahommed V. to form a Cabinet in 1911, and remained at the head of affairs until July 1912. After the murder of Shekhet Pasha in June 1913 he became grand vizier and Minister for Foreign Affairs, and during his tenure of power was a strong supporter of German influence in Turkey. He resigned in Feb. 1917. He was murdered in Rome Dec. 6 1921.

SAID PASHA (c.1830-1914), Turkish statesman (see 23.1008*), again became chief minister in the autumn of 1911, and in Dec. proposed to restore to the Sultan the power of dissolving the Chamber without the assent of the Senate. This proceeding gave rise to many storms, and Said Pasha reconstructed his Cabinet Jan. 22 1912. On Jan. 21 he published in the London *Daily Telegraph* the proposed reform programme of his Ministry. He was forced to resign July 17 1912 owing to the strength of the revolutionary movement in the army. He died in 1914.

ST. ALDWYN, MICHAEL EDWARD HICKS BRACH, 1ST EARL (1837-1916), English statesman (see 23.1013), was created an earl in 1915. He died in London April 30 1916.

ST. JOHN, FLORENCE (1854-1912), English actress, whose maiden name was Greig, was born at Tavistock, Devon, March 8 1854. She was three times married, first to Mr. St. John, R.N., secondly to Lithgow James, and lastly to C. D. Marius, both on the stage. Her first appearance was in 1868, and she subsequently

* These figures indicate the volume and page number of the previous article.

played in a very large number of light operas, winning special success as Germaine in *Les Cloches de Corneville* and in *Madame Favari*. In 1902 she abandoned opera for drama, playing Nell Gwynne in *English Nell* and other comedy parts. She retired in 1910 and died in London Jan. 30 1912.

ST. LOUIS (see 24.24).—The pop. of St. Louis in 1920 was 772,807, an increase of 85,868 since 1910, or 12.5%. In the preceding decade the increase was 111,701 or 19.4%. The area remained as fixed in 1876, but the increasing pop. and industries have spread beyond these limits. The city, the counties of St. Louis and St. Charles in Missouri and the counties of St. Clair and Madison in Illinois are grouped as the St. Louis district and treated as a whole in the U.S. industrial census. In 1920 the district contained 1,145,443 inhabitants.

Municipal Government and Activities.—A new charter adopted in 1914 reduced the elective officers to mayor, comptroller, president and board of aldermen, collector, treasurer, recorder of deeds, sheriff and coroner, with terms of four years. The legislative branch is unicameral. Each of the 28 wards has a resident alderman elected by the entire city vote, one-half of the board retiring biennially. Mayor, comptroller and president of the board of aldermen form a board of estimate and apportionment. An appointive board of public service consists of a president and four directors of divisions, public welfare, public safety, public utilities, and streets and sewers. Municipal departments and bureaus are grouped in the four divisions. The president of the board has charge of public work and improvements. In 1919 the city's outstanding bonds amounted to \$19,884,000, to which in 1920 was added \$5,500,000 for removal of railway grade crossings, for a municipal farm to afford better treatment of the tubercular and insane, for new engine houses and reconstruction of streets and for municipal lighting equipment. The tax rate for 1920-1 was \$2.55 per \$100 assessed valuation, divided as follows: state purposes, \$0.18; public schools, \$0.78; municipal government, \$1.51; public library, \$0.04; art museum, \$0.02; zoological park, \$0.02. The assessed valuation of realty and personalty for 1920-1 was \$777,500,000. City planning was undertaken in 1912 with a commission of nine citizens and five *ex-officio* members. The work done includes a concrete dock, mechanically equipped to convey freight between river and railways. A zoning law determines definitely the residential, industrial and commercial districts; 29 street widenings, openings and cut-offs were under construction in 1921. Neighbourhood parks, playgrounds and squares were increased to 80, embracing 2,908 acres. A pageant and masque given by 2,000 participants before audiences of 100,000 led to the construction in 1917 of a municipal theatre in Forest Park, with accommodation for 9,270. At a cost of \$7,200,000, the city completed in 1917 a municipal bridge of massive steel construction, double track and double deck, across the Mississippi. About five years earlier the McKinley bridge was erected by the Illinois Traction Co., primarily to admit interurban electric trains. Kingshighway viaduct, 855 ft. long, completed in 1912 at a cost of \$500,000, crosses the railway tracks and unites western sections of the city. A municipal court building, a city jail and a children's detention house, all of stone, were erected, the first in 1912, the others in succeeding years, at a cost of \$1,855,000.

Charities and Education.—At a cost of \$5,000,000 a new medical school, hospital and children's hospital, occupying several city blocks fronting on Forest Park, have been completed since 1911. The hospital, opened in 1914, represents an investment of \$2,000,000, the sum left 30 years ago by Robert A. Barnes, a banker whose name the institution bears. The medical school, a department of Washington University, includes laboratory, anatomical, clinical and other buildings. In 1914 James Campbell left an estate, valued at \$10,000,000, in trust to St. Louis University (subject to the life income of certain surviving relatives) for the erection and support of a hospital and for the advancement of medicine and surgery. From the surplus of the Louisiana Purchase Exposition was constructed in 1914 the Jefferson Memorial costing \$485,000 and devoted to the collections of the Missouri Historical Society. On new public school buildings, and expansions of old, St. Louis expended during 1910-20, \$3,177,000.

Finance.—In 1920 the assets of the banks and trust companies of St. Louis were \$637,615,811.45, and bank clearings were \$8,294,027,135; in 1910 the latter were \$3,727,949,379. The First National Bank, with total resources of \$155,953,137, was formed in 1919 by a consolidation of three existing banks.

Commerce and Industry.—According to the records of the Merchants' Exchange and the Chamber of Commerce, 35 lines of industry in the St. Louis district did a business in 1920 of \$1,582,957,145. Some of the largest items of wholesale trade in 1920 were dry goods, \$240,000,000; carpets, rugs and linoleums, also \$240,000,000; boots and shoes, \$175,000,000; groceries, \$175,000,000; railway supplies, \$210,000,000; hardware, \$115,000,000; foundry products, \$175,000,000. St. Louis receives 70,000 H.P. by a 110,000-volt transmission line from the Keokuk dam in the Mississippi at Keokuk, Ia. Motor licenses issued in 1914-5 numbered 9,867, and 45,049 in 1919-20. The city of St. Louis as the largest horse and mule

market in the world was maintained, the volume of business in 1919 being \$30,000,000. The city continued to be the largest primary fur market of the world, with sales of \$27,200,000 in 1920. Sales of meat products in 1919 were \$128,000,000; hog receipts, 3,650,534; head cattle receipts, 1,500,000. The foreign trade of St. Louis was \$100,000,000 in 1920, an increase of \$25,000,000 over 1919. The total tonnage shipped out of St. Louis in 1920, domestic and export, was 29,036,405 (by rail) and 166,140 (by water); tonnage received in the same year was 43,104,519 (by rail) and 177,925 (by water).

The more important new buildings of the period 1910-20 with the amounts they cost were: the Statler hotel, \$3,000,000; the Warwick hotel, \$400,000; the cathedral of St. Louis, \$2,000,000; the Missouri athletic club, \$500,000; the Railway Exchange, \$3,000,000, 18 storeys, covering an entire city block; the University club, \$600,000; the Young Women's Christian Association, \$500,000; the Boatmen's bank, \$750,000; the Arcade, \$1,250,000; the Post-Dispatch building, \$500,000; the Bevo Manufacturing Company, \$1,000,000. The cost of new buildings in 1919 was \$20,538,450.

The *St. Louis Republic*, a morning newspaper founded in 1808, was purchased in 1919 by the *St. Louis Globe-Democrat* (a Republican paper), and discontinued. This left two morning newspapers, the *Globe-Democrat*, and the *Westliche Post* (German). There was a marked increase in the circulation of the evening papers.

When the Armistice was signed Nov. 11 1918 one in 13 of the city's pop.—56,944—was in the army, navy or marine corps. The total casualties were 2,511, of which 1,384 were killed in battle. Of the three Liberty Loans, St. Louis took the equivalent of 25% of the assessed value of the city's realty and personality. On the third, fourth and fifth calls for loans the St. Louis Federal Reserve district was the first to subscribe its quota. On the third loan the city subscribed \$65 for every man, woman and child, nearly three times the quota. (W. B. St.)

ST. MIHEL, BATTLE OF: see WOEVRE, BATTLES IN THE, section 2.

ST. PIERRE and MIQUELON (see 24.41).—During the early years of the decade 1910-20 this little French colony suffered severely as a result of unprofitable fisheries, and large numbers of its people emigrated to Nova Scotia and Quebec. After the World War began in 1914 the French draft law called all the male inhabitants of conscript age to France where they took part in various services. As their withdrawal crippled the fisheries, which could not be prosecuted by the older people and the women and children, the survivors were returned as speedily as possible and ordinary operations were resumed. But during the decade, also, the use of the steam trawlers in the fisheries was on the increase, displacing the wooden sailing vessels previously employed, and this also lessened the number of those finding steady employment. However, during the later years of the war, with fish increasing in value, the colony became very prosperous, and after the Armistice the French Government decided to build a large refrigerating plant, costing about £1,000,000 at St. Pierre for the treatment of cod and other fishes. The financial success of this project was doubted by many, but this deep-sea fishery was being supported by France as a training school of men for its navy, and for the same reason generous bounties are given on all the fish caught. The pop. was in 1920 about 4,500, but the prosperity of the little community was impaired by the difficulties of exchange.

SAINT-SAËNS, CHARLES CAMILLE (1835-1921), French musical composer (see 24.44), died at Algiers Dec. 16 1921.

SAINTSBURY, GEORGE EDWARD BATEMAN (1845-), English man of letters (see 24.45), published subsequently to 1910 a *History of English Prose Rhythm* (1912); *The English Novel* (1913); *A First Book of English Literature* (1914); *The Peace of the Augustans* (1916); *A History of the French Novel* (2 vols., 1917-9) and *Notes on a Cellarbook* (1920).

SAIONJI, KIMMOCHI, PRINCE (1839-), Japanese statesman, was born in Kyoto, in 1839. When less than 20 years of age, he took part in the councils which led to the Restoration and at 19 was commander-in-chief of an imperial army. He studied in France from 1869 to 1880, and returned home imbued with democratic ideas. In 1881 he commenced his official career and in the following year accompanied Mr. (afterwards Prince) Ito to Europe and the United States to investigate the parliamentary system. In 1885 he was appointed minister to Austria; in 1888 he occupied a similar post in Berlin and in 1891 was appointed president of the Board of Decoration. In 1893, he became vice-

president of the House of Peers and was raised to the Privy Council in 1894. In the same year he received the portfolio of education in the second Ito Cabinet, temporarily acting as Minister of Foreign Affairs during the illness of the late Count Mutsu. He was again Minister for Education in the third Ito Cabinet from Jan. to June 1898, and was nominated president of the Privy Council on the death of Count Kuroda, three times acting as prime minister during the interval between the resignation of one Cabinet and the formation of the succeeding one. In July 1903, he became the leader of the Seiyu-Kai and in 1905 formed his first Cabinet as prime minister; he was again premier in 1911 to 1912. In 1919 he represented Japan as chief envoy at the Peace Conference and was invested with the Grand Order of Merit. He was made a prince in 1920 in recognition of his services in connexion with the World War and the Peace Conference.

SAKHALIN (see 24.54).—The Japanese portion of the island of Sakhalin, to the S. of the parallel of 50° N. lat., known officially as Karafuto, was ceded to Japan under the treaty of peace with Russia in Oct. 1905. The area is about 13,128 sq. m. and the pop. in 1920 was 105,765. The taxes and other sources of revenue from the island, with the addition of a grant of about 700,000 yen from the national treasury, are sufficient to cover the administration, the budget balancing at about 10,000,000 yen.

The chief industry of the island, and one of the oldest, is that of the fisheries, and these are being successfully developed. The most important is the herring fishery, followed by trout and salmon, these all being relegated to specially controlled areas; cod and crab are also plentiful, the latter being canned and exported chiefly to America.

About 17,000 ac. of land were under cultivation in 1918, the chief crops raised being oats, barley, potatoes, peas and buckwheat. More than 900,000 ac. suitable for cultivation and pasturage, are still available and many settlers are engaged in agriculture, the climate and soil rendering this a profitable undertaking. There are over 8,000,000 ac. of practically untouched forest, chiefly conifer, on the island, providing in the future an almost inexhaustible supply for the manufacture of pulp for paper-making. In consequence, five pulp manufactories have already been established, each producing over 10,000 tons per annum, and five more are projected.

There are three important coal-fields in the island, producing about 136,000 tons annually. Alluvial gold is found in the river beds, iron pyrites exist in large quantities in the Noto peninsula, and in 1907 and 1913 oil-bearing strata were discovered on the W. coast in large areas at Anshi and Notsamu. (H. S.A.)

SALANDRA, ANTONIO (1853—), Italian statesman, was born at Troia in 1853. He first entered parliament as member for Lucera and from the beginning of his political career he sympathized with the views of Baron Sonnino. When the latter became Treasury Minister in the Crispi Cabinet of 1893, Salandra was chosen under-secretary in that department. He was Minister of Finance in the first Sonnino Cabinet of 1906 and Treasury Minister in the second (1909-10). When in March 1914 Sig. Giolitti resigned, Sig. Salandra was called upon to form the new Cabinet, and he was Premier when the World War broke out in Aug. following. On the death of the Marquis di San Giuliano in Oct. he offered the Foreign Office to his former chief, Baron Sonnino, who accepted it. It was the Salandra Cabinet which took the momentous decision of bringing Italy into the World War on the side of the Allies, and it conducted the Government of the country during the first months of the campaign more successfully than any of the succeeding war Cabinets. On resigning office in June 1916, he continued to support both the Boselli and the Orlando Cabinets. As professor of Constitutional Law in the university of Naples he published several important works on legal subjects, and translated Spencer's *Principles of Sociology*.

SALISBURY, JAMES EDWARD HUBERT GASCOYNE-CECIL, 4TH MARQUESS OF (1861—), English politician, eldest son of the 3rd marquess (see 24.76), was educated at Eton and University College, Oxford, where he took a second-class in History in 1884. The next year he entered Parliament as member for Darwen. He was defeated in 1892, but he returned as member for Rochester in 1893 and remained in the House of Commons till he succeeded his father in 1903. He fought in the S. African War with the 4th battalion of the Bedfordshire regiment, and was mentioned in despatches. On his return in 1900 he became Under-Secretary for Foreign Affairs, a post which on succeeding to the peerage he

quitted for that of Privy Seal in the Cabinet of his cousin, Mr. Arthur Balfour; and he held, for some months in 1905, the office of President of the Board of Trade. Lord Salisbury never loomed large in the House of Commons, though he was for some years chairman of the Church Parliamentary Committee, and discharged competently his duties as Foreign Under-Secretary. But he gradually came to occupy a position of increased authority in the Upper House. He threw in his lot in 1911 with the "Die-hards," and spoke in favour of defeating the Parliament bill and daring the Government to create sufficient peers to carry it. During the early years of the war he was energetic in the discharge of his military duties as lieutenant-colonel of his yeomanry regiment. He did not join either Coalition Government, but was critical of both, taking an independent line. As the war drew to a close he gradually came to assume the informal leadership of a Conservative and Unionist Opposition in his House, showing himself particularly sensitive to departures from the old policy of his party on Irish and ecclesiastical questions. He married in 1887 Lady Cicely Alice Gore, daughter of the 5th Earl of Arran, and had two sons and two daughters. He was created K.G. in 1917.

SALONIKA CAMPAIGNS, 1915-1918.—Under the heading of SERBIAN CAMPAIGNS the conquest of Serbia in 1915 by Austro-Hungarian forces is narrated. The idea of reinforcing the Serbian front with Allied forces had been contemplated both in England and in France some time before it was carried out. British and French guns, in charge of naval missions, had taken some part in the campaign of 1914, and stores had been sent up from Salonika at intervals. In the winter of 1914-5 Lord Kitchener several times considered the advisability of sending a number of the British Army Divisions into Serbia *via* Salonika. On the part of the French, M. Briand, it is said, proposed later in 1914 to make a serious military effort in the Balkans. But the Dardanelles campaign diverted attention from this project, and it was not till in August 1915, when the failure of the Dardanelles offensive was evident, that the creation of an Anglo-French army on the Balkan front was seriously undertaken. General Sarrail, whose military reputation stood very high in France, had been suddenly deprived of his command of the III. Army by Joffre, ostensibly owing to an unsuccessful combat at Bourreuilles in Argonne, but really as the result of long-continued friction between the two. Sarrail, however, stood in close relations with the political leaders of the Left, and the autocratic methods of Joffre's G.Q.G. had already raised considerable opposition in the Government and the Chamber; it suited the Government, therefore, to satisfy the Left, to snub the G.Q.G., and to remove to a distance a forceful and ambitious personality, by sending Sarrail to the Mediterranean as commander of an army yet to be created.

Appointed on Aug. 5, Sarrail was ordered to study the military situation and submit proposals. In his written projects he came to the conclusion that it was impossible to abandon ground in the Gallipoli peninsula, and had asked for both his own and the British contingents to be made up entirely from forces in France or in England. An inter-Allied conference, held at Calais early in September, had agreed to this, but with the reservation that no forces were to go till after the forthcoming Champagne and Artois offensives had taken place. But the news of the Bulgarian mobilization drove home at last the urgency of the crisis. Orders went to the Dardanelles on Sept. 26 for two British Divisions—in the sequel one—to go thence to Salonika; the French "Expeditionary Corps" was likewise to send a Division, and the Greek authorities had agreed to permit the landing. Sarrail himself was to bring a mixed brigade from France, as an earnest of the forces promised later.

On Oct. 3 advanced parties of the French landed at Salonika without difficulty, only a formal protest being made by the authorities on the spot. Next day M. Venizelos in a speech at Athens declared that Greece would come to the aid of her ally Serbia against any attack by Bulgaria, and at once a crisis arose at Athens. On the 5th King Constantine informed Venizelos that the policy indicated had not his support, and the Government fell, to give place to the neutralist Zaimis cabinet.

During the first few days instructions from Paris to Bailloud (commanding on the spot pending Sarrail's arrival) varied several times, apparently in accordance with political nuances. At first (Oct. 3) the word was to concentrate at Nish, in the heart of Serbia; next, the Greek frontier was not to be crossed (Oct. 10); and then again (Oct. 12) authority was given to take over protection of the railway between Demir Kapu defile and the Greek frontier against possible attack from Strumitsa in Bulgaria, thereby releasing a small Serbian force to rejoin its own army. Meantime the Serbians demanded more direct assistance, but Sarrail (who arrived on the 12th), taking into account the size of his force—only 1½ divisions plus the British 10th Div. which was not under his orders—and the fact that it could only disembark and push on by dribblets, determined to limit his advance to the near side of Demir Kapu. On Oct. 14 the leading French troops arrived at Strumitsa station (in Serbia) in time to aid the Serbian railway guards in repelling an inroad from Strumitsa.

In Sarrail's opinion the only service he could render was to concentrate on the routes to Strumitsa, and, by an offensive into Bulgarian territory, to draw off as many Bulgarian forces as possible from the main attack further north. General Mahon, commanding the British 10th Div., took the same view,¹ and formed a mixed force which began to move up to Doiran, on the right rear of the French group in the Rabrovo region. On the 17th, however, in answer to a request from the Serbian commander at Uskub, Sarrail began to push a brigade beyond the Demir Kapu defile to Krivolak, but he refused to advance it to Veles, though again pressed to do so by the Serbs, and in fact a sharp attack developed from Strumitsa on Rabrovo on the 21st and 22nd, which, till it was repulsed, threatened to isolate all French detachments N. of Strumitsa station. Meanwhile, Paris sent further instructions to the effect that all possible help should be afforded to the Serbs, subject to the limitation that the French communications with Salonika were in no case to be compromised. In reality, the French and British Governments were very uneasy about the attitude of the Greek Army, a considerable force of which lay in the region N.E. of Salonika. The fall of Venizelos had put an end to the prospect of Greek coöperation, and under the new régime the local military and civil authorities began to oppose every move of the Allies, which was not entirely covered by Serbia's treaty rights, to the use of Salonika and the railway. Thus, when Mahon's force moved forward the use of the Salonika-Kilkish (Kukush)-Doiran line was refused, and it had to use the main line, detraining in the midst of the French, and work thence outwards towards its post at Doiran.

On Nov. 1 the 122nd French Div. began to arrive from France, and Sarrail had already prepared to attack from Rabrovo towards Strumitsa with Bailloud's 156th Div., with Mahon in echelon behind his right, while his forces about Krivolak and Kavadar (51st Div.) made ready to attack in flank any Bulgarian force which should advance up the Cerna (Tserna) in pursuit of the Serbians. On Nov. 3 an attack was accordingly delivered northward from a front E. of Rabrovo; weather and the difficulty of the country brought it, however, to a standstill on the 6th, though local advances were made later. At this moment (Nov. 4) Galliéni, having become War Minister in the new French cabinet, telegraphed orders for the French Army to operate towards Veles, adding that four more British divisions were to be sent, which on arrival would take over the front leftwards from Doiran. The British 22nd Div. was in fact already close to Salonika, with another under orders to follow. But Sarrail judged that it was impossible to wait for these reinforcements. Toderov's Bulgarian Army had already thrust itself between the Serbian Main Army and Krivolak, and the

urgent thing was to relieve pressure on that part of the Serbian forces which was retiring by the Babuna pass on Prilep, while reserving the possibility of action towards Veles if the Serbian Main Army should after all seek to break through towards its Allies. Orders were therefore given to the Krivolak-Kavadar force (57th Div. to be reinforced by the 122nd Div.) to take the offensive westward over the Cerna, so as to strike the pursuers in flank or rear. On the 6th-9th accordingly the 57th Div. crossed the Cerna and pushed an advance into the mountains towards the Babuna, still held by the Serbs. But the Bulgarians were in force, and the French retired to their Cerna bridgeheads, which the Bulgarians attacked without success on the 12th, 13th, 14th and 15th.

During these and the following days instructions came repeatedly from Paris to modify the French commander's views and dispositions, now laying emphasis upon coöperation with the Serbs, now upon dangers from the Greek Army in rear. Finally on Nov. 21 Sarrail was given a free hand to decide what aid he could give to the Serbians and at what moment he should retire on Salonika. He adopted at first a middle course. He wished neither to attack at the risk of involving two-thirds of his forces in the Serbian *débâcle* (the Babuna had been turned by the N. on Nov. 14), nor to fall back to Salonika, where prestige counted for so much, but to hold on in the entrenched camp of Kavadar in the hope of "something turning up." On the 21st-22nd, however, the retirement of the 122nd Div. over the Cerna under some pressure, together with the general military situation and a definitive refusal of reinforcements from France,² decided him in favour of falling back to Salonika, a decision approved by Galliéni. Four days later Sarrail was officially informed that the Serbians were retreating in the Adriatic direction. The preparations for the Vardar retirement had already begun on the 24th with the seizure of a position on the E. bank, to prevent interference with the retreat of the Krivolak-Kavadar force on Demir Kapu. On Dec. 1 only rear-guards remained at Krivolak. By the night of the 3rd-4th all troops were inside Demir Kapu, and on the 6th this position also was given up. On the 8th the Bulgarians, who had from time to time attacked the rear-guards on the Vardar and the positions near Kosturino on the Strumitsa route, delivered a more concerted attack on the front Ormanli (now held by the British)-Kosturino-Gradets on the E. and Mirovcha Petrovo on the W. of the Vardar. Their evident intention was envelopment, and on the 9th, judging the centre of his line to be too pronounced a salient, Sarrail took up a position along the Petrovska stream, W. of the Vardar and the heights of Dedeli E. of it, the village of Dedeli being held by Mahon's forces, which from that point were echeloned back to Lake Doiran. From this position also the Allies retired under threat of envelopment during the night 11-12, after holding their ground against attacks on the 11th. Lastly, the French 122nd and 57th Divs., at Gjevgyeli (Gevgeli) and near Doiran, covered the evacuation of part of Mahon's force on to the Salonika railway and the reconstitution of the 156th French Div., which had been considerably split up.

Thus the drive into Serbia came to an end, with little material loss, but a sad diminution of prestige, and the forces fell back to the following positions about Salonika: advanced guards of 120th French Div. Karasuli with a detachment at Gumenyc, and of 57th French Div. with cavalry, Kilkish, with a detachment at Kilindir; main body (122nd, 156th, 57th) in position on the line Doganyi-Daudli. British 10th and 22nd Divs. Salonika, with other British forces arriving. Important points on the railway had been destroyed during the retreat. Meanwhile, on Dec. 4,

¹ According to Sarrail, the British Government instructed Mahon that his troops were to remain at Salonika, and it was on his own initiative that the British general formed a mobile force. Further instructions authorized Mahon to move forward but forbade him to cross the Greek frontier, until on Oct. 27 a final telegram removed this restriction.

² At that moment, according to Falkenhayn, the combatant strength of the Allies in France was to that of the Germans in the ratio of rather more than 3 to 2. Sarrail says that in his interview with Lord Kitchener on Nov. 17, the latter informed him that Joffre had declared that he would not give him (Sarrail) another man, and that the British would furnish five divisions instead. In accordance with this promise, besides the 10th and 22nd Divs., the 27th and 28th Divs. from France landed at Salonika in the last days of Nov. and first days of Dec., and the 26th Div. also from France, early in Jan. 1916.

the Serbs had evacuated Monastir in their now frankly westward retirement.

The reassembly of the Allied Salonika forces around their port of origin naturally raised the question—were they to remain there? Their *locus standi* had been the fact that they were Allies of Serbia using a line of communications to which Serbia was by treaty entitled. This part of the case no longer existed, Serbia being wholly in the hands of the enemy, and could only be revived if and when the Serbian Army were transferred from the Adriatic ports on which it had retreated to Salonika. Another part of the justification for the Allies' presence was the admitted fact that they had come at the request of Venizelos, and for the purposes of common action with the Greeks, but since Venizelos's fall even the Zaimis cabinet, representing "benevolent" neutrality, had given way to a cabinet representing at least strict neutrality,¹ which gave the Germanophil element at Salonika all the official justification it needed to pursue the policy of obstruction that it had already initiated in the Zaimis period. On the other hand the factor of prestige was one of great weight, especially in view of the pending abandonment of the Dardanelles campaign, and although Sarrail suggested that evacuation followed by a dramatic offensive at some other point would more than restore the lost prestige, it was decided that Salonika should be held. Beyond that decision, however, no clear military or political intention was at that time formed. The policies of the British, French and Russian Governments were in unison as to the problem of Greece, and it seems to have been thought that, by remaining, the Salonika force would confront the enemy with as difficult a diplomatic problem as its own. This was, indeed, the case. The policy to be followed by the Central Powers, both towards Greece and in occupied Serbia and Albania, was wholly unsettled. "While the troops of the two Imperial Armies were hastening from victory to victory," says General von Cramon, the German military commissioner at Austrian headquarters, "behind the scenes, at the two general headquarters, the clouds were gathering of that conflict which in the end brought about the reverses of 1916." Although on Nov. 6 it had been agreed that operations were to be pushed with all energy towards Salonika, Falkenhayn almost immediately began to check the further south-westward advance of German troops, and though Conrad succeeded in bringing the German command to renewed coöperation, this was obviously to be limited to a minimum, both on account of supply difficulties in the Balkans and of the pressing requirements of the two main theatres—in particular those of the forthcoming attack on Verdun, of which only a few men in the German headquarters and none in the Austrian had the secret. Falkenhayn's view was that the Bulgarians alone should undertake the campaign in southern Serbia. But, whatever the attitude of Greece towards Germany, it was so hostile towards Bulgaria that to cross the frontier in pursuit of Sarrail without a large proportion of German troops being included in the advance was politically impossible. Austria herself was absorbed in Montenegrin-Albanian enterprises, and could give no direct assistance in the advance to Salonika that her general staff advocated. Moreover, Conrad had his secret as well as Falkenhayn—he was planning to carry out his offensive of Asiago, with or without the aid of Germany.

At the end of 1915 therefore, though the Central Powers had succeeded in their purpose—Serbia being conquered and the railway to Constantinople reopened—whereas the Entente had failed, the outlook was no clearer for the former than for the latter. The pursuit was accordingly suspended at the frontier, partly perhaps in the hope that the Entente would itself take the initiative in closing down the operations. If they did not do so Falkenhayn was determined that eventually

¹ The first act of the Skouloudis ministry had been to announce that any of the Allied forces in Serbia which retreated into Greece would be disarmed and interned. A prompt note from the British and French Governments closed this incident, but the indication of policy was unmistakable. About the same time Skouloudis notified the Bulgarian Government that it would not permit the latter's troops to cross the frontier.

the Bulgarians alone should remain on this front. They were, by the terms of the military agreement, unavailable for any other, and if they succeeded in containing even a smaller force of Entente troops that was not so limited, something was gained for nothing. On the other hand this idea implied a defensive position short of the Greek frontier, as a purely Bulgarian advance into Greece was impossible. Thus, at the beginning of 1916, the opposing forces stood roughly 20 m. apart, each limited against its own will to a strict defensive by political conditions and each regarded by its own superior authorities as a "commitment."

At the end of the year two incidents occurred to illustrate the complexities of the Salonika front. On Dec. 30, though Bulgarian and German forces were forbidden to cross the frontier, German aircraft, by order, bombed the city of Salonika itself, where nine out of ten of their possible victims were neutrals and the tenth an agent of their own side. Sarrail promptly retaliated by arresting the German, Austrian and Bulgarian consuls, hitherto left unmolested. Another air raid took place on Feb. 1 1916, to which the Allies replied by bombing the village of Petrich, just within the Bulgarian frontier, but as the village contained Greek and Serbian as well as Bulgarian inhabitants, a complaint was made, and Sarrail received orders not to repeat such raids. A few days before this another incident showed that the personal estrangements of Joffre and Sarrail were still operative. The army of the Orient had been brought under Joffre's command² early in December, and Joffre had taken the opportunity to send out Castelnau to report on Sarrail's management of the situation. Castelnau, however, pronounced himself satisfied with what he saw, and only issued a few instructions as to details. Nevertheless, in various ways the friends and the enemies of Sarrail alike busied themselves with accusations and counter-accusations, out of which a regular *affaire* was growing up to complicate an already confused situation. Relations between Sarrail and Mahon on the other hand were excellent, and although each was independent of the other, and the British general was himself under the command of General Sir C. Monro, commander-in-chief in the Mediterranean, no important divergencies of policy developed during the phase of passive defence in the precincts of Salonika.

With the Greeks, naturally, all possible causes of friction existed. Army commanders operating under war conditions are not prone to sacrifice realities to appearances, and what seemed to them plain military common sense was, from the point of view of the Greeks, high-handed conduct to be resisted by all safe means of obstruction. Amongst the major questions at issue were the disarmament of the coast defences of Salonika, the use of the Salonika-Doiran railway for the British contingent, the feeding of the Greek forces E. of Salonika who were dependent for supply upon railways seized by the Allies, and the continuance or non-continuance of the Greek garrison in Salonika city. Minor questions of an administrative character were naturally innumerable. Most of the energy of the staffs in Salonika and the legations at Athens was devoted to finding solutions for conflicts which the equivocal position of the Allies made inevitable.³ During these conflicts the Salonika lines,

² Joffre was *Commandant en Chef* of the "North-Eastern group of Armies," no other formations having been contemplated before the war. On being sent to the E. Sarrail was appointed *Commandant en Chef* also. But, in Dec., Briand placed Sarrail's forces under Joffre's supreme command.

³ On Jan. 12 1916 the bridge of Demir Hissar on the Struma was blown up by a special force sent out by Sarrail in the presence of the Greek forces stationed there—a high-handed act which could only be excused or justified by the necessity of preventing the Bulgarians and Germans from deploying heavy artillery against the N.E. part of Salonika in case of siege. On Jan. 28 1916 another problem received an enforced solution, after negotiations had failed to find an "elegant" one. Anglo-French forces by a *coup de main* occupied the Greek coast-defence batteries on the Gulf of Salonika. These incidents naturally intensified the hostility of the Greek officers and officials to the Allied occupation, or at least gave them tangible grievances. In particular, the feeding of the Greek forces isolated by the cutting of the Struma railways caused difficulties, and from it, in part at any rate, arose the critical question of demobilising the Greek Army in the Spring of 1916.

with the aid of civil labour, were made defensible by the first weeks of the new year. The line selected ran from the Vardar mouth, round by Doganzi and Daudli to the neighbourhood of Langaza, whence it passed along the barrier of lakes to the head of the gulf of Orfano—80 m. of frontage for a force of nine divisions.¹ Of this frontage, however, nearly 45 m. was guarded by lake and swamp; and, taking into account the presence of large bodies of Greek troops in the Seres-Rupel region to the right front and in the Vodena-Florina region to the left front, Sarrail considered that danger was practically confined to the central sector between Lake Langaza and the Vardar, in the event the position was ever attacked.

During this period (Jan.-Feb. 1916), the Bulgarians were reinforced by the German XI. Army (von Gallwitz) consisting of the IV. Res. Corps (101st and 103rd Divs.) and the Alpine Corps, and by their own 1st Army, all these forces aligning themselves along the Greek border from Lake Ohrida to the point at which the Struma enters Bulgarian territory. The 1st Bulgarian Army, with flank guards at Dibra and Elbasan in Albania, had two divisions² on the front S. of Monastir-Duditsa; the XI. German Army, with 1½ Bulgarian Divisions attached, held the Vardar valley between Duditsa and the Belashitsa Planina, and Todorov's II. Bulgarian Army of three divisions that ranged from Strumitsa to Petrich, with detachments further E. at Nevrekop (Mesta valley). But in March Falkenhayn began to withdraw all the German formations save the 101st Div., which continued in the Balkans and was gradually reduced to a cadre. On his side Sarrail made some slight demonstrations towards Doiran and towards Vodena, but otherwise no move occurred. Early in March 1916, however, in the crisis produced by the attack on Verdun, Joffre telegraphed orders to Sarrail to advance in order to fix the enemy's forces on his front. On the other hand General Mahon, on asking for instructions, was forbidden to move until authorized by the British Government.³ The relief offensive, therefore, was limited to a skirmishing advance by the French, which began on March 13, and gradually brought the French 51st Div. to the N. of Kilkish, and the 122nd to the N. of Lake Amatovo, the 156th between them (March 31).

During April 1916, while French cavalry moved out W. of the Vardar towards Vodena and the 17th Colonial Div. came up behind the centre, the British in their turn began to move up to Kilkish, authority to participate "in an operation of a demonstrative character" having been given by the War Office about April 10 (Joffre to Sarrail, April 20). Lastly, the Serbian Army, reconstituted and partially re-equipped at Corfu, was beginning to land at Salonika, and by June 1 118,000 combatants and non-combatants were present, completing their equipment and organization in the Chalcidic peninsula. These methodical proceedings, however, did not satisfy Joffre, whose instructions to Sarrail from March onwards were to prepare for an offensive in earnest. To Sarrail's demand for reinforcements for such an offensive, the French commander-in-chief replied that the French Army of the E. must prepare to attack at the moment fixed by himself, even without the British. In explanation, he hinted that when that moment came, not only would British objections be removed, and all five British divisions be equipped for mountain warfare (making Sarrail's total force, with the Serbians, 300,000 strong to the enemy's 260,000), but Rumania and Greece would be in the field as his Allies. Thus for the first time since the Serbian retreat the Salonika force was assigned to a positive purpose. It will appear in the sequel how much of reality and how much of illusion was contained in the scheme, which, in sum, was to attack at a date chosen in relation to other theatres and especially Rumania, with Sofia as the objective.

¹ The withdrawal from Helles freed further French troops, from whom a serviceable brigade was made up and combined with a brigade from France to form the 17th Colonial Division.

² The Bulgarian divisions had twice the infantry strength of a French or German division.

³ Sarrail's orders were issued by G.O.G. without consultation with the Government of Lord Kitchener. (Sarrail, p. 83.)

Meantime, an important incident had taken place on the Struma frontier. In accordance with their declared policy of standing aside and leaving a "lists" for the combatants, the Greeks had disarmed and evacuated their fort of Dova Tepe, situated on the watershed between the Vardar and Struma basins and commanding a knot of communications. In the course of his gradual advance to the frontier, Sarrail put a detachment into this fort on May 10. But further to the right, outside his reach, lay a still more important fort, that of Rupel defile. This fort was not merely disarmed but actually handed over to the Bulgarians by the local Greek general, with or without authority from Athens (May 26).

Events had moved. Though the German forces (except the cadre of the 101st Div.) had by this time been withdrawn from the Balkan front, the Greeks had apparently overcome their repugnance to a purely Bulgarian inroad, to the extent of actually facilitating it. The Allies' right was, potentially, turned, and if the occurrence were any indication of probabilities of the future, their rear also was endangered. Action was taken promptly by Sarrail. A mobile group of all arms was moved into the Struma region, and with the agreement of Gen. Milne (who in May succeeded Mahon in command of the British) and of the Entente Governments, the Greek authorities at Salonika were deprived of power by the proclamation of a state of siege (June 3). A day or two later London and Paris also acted. An economic blockade of the Greek coast was declared, and on the 18th Sarrail was ordered to send a brigade by sea to Athens. King Constantine accepted the ultimatum of the Allies (June 21), and Zaimis returned to power on the basis of friendly neutrality. A little later the Rupel incident had its last and most important sequel in the Venezelist *coup d'état* of Aug. 30.

Militarily the seizure of Rupel, carried out at the suggestion of Falkenhayn, seems to have had no truly offensive intention. The Central Powers had abandoned the idea of invading Greece once for all about the end of March, and the Bulgarians acted with the idea of guarding their left, and securing connexion with any Turkish forces which might be sent to their aid by the Constantinople-Seres railway, though in view of the situation in Armenia such a reinforcement was unlikely. As for Sarrail, so also for his opponents, the Balkan front was already involved in a larger game.

As has been noted above, the idea of an Allied offensive from Salonika in co-operation with a Rumanian intervention came under discussion as early as mid-April; at that time Joffre seems to have thought that this intervention might come in a few weeks, for he overruled Sarrail's objections to commencing operations in the hot weather, and fixed the month of June for the beginning of the offensive. Under these instructions Sarrail formed his first plan (May 2) which was, in brief, to employ the Serbs on the left wing for the attack of Monastir (frontally and by envelopment), and for pressure on the Cerna bend and the passes further E. towards the Vardar; to place a French division on the Vardar and the railway; to have three British divisions, with a fourth on their right rear, so placed as to execute a demonstrative attack on the strongest part of the enemy's front, viz. Vardar-Doiran; and to attack with three French divisions from Popovo Surlovo-Dova Tepe and Poroy northwards through the Belashitsa Planina, while the French Struma mobile group demonstrated towards the Demir Hisar angle of the Struma, and the fifth British division with cavalry watched the lower Struma front. In case the semi-offensive, semi-demonstrative, operations should develop into a real advance, the Serbs were to take Veles and Shtip, the British Radovisht-Strumitsa, and the French Jumaya as their objectives. The armies would thus condense their front as they advanced, the route Monastir-Veles marking the extreme left of the Serbian movement, and that of the upper Struma, famous in the war of 1913, taking the French into positions on the Bulgarian line of retreat. But the negotiations of the Allies with Rumania, and their internal discussions relative to their Salonika operations and their policy in Greece, dragged on. On June 6 Gen. Milne was

informed by the British Government that he was not to engage in offensive operations, and was only to consider himself under Sarrail's orders in respect of the defence of the entrenched camp. He informed Sarrail accordingly, and suggested that the British should take over the Struma front, to which Sarrail agreed. The Serbs were now preparing to take up the front from Vodena to Lyumnitsa, with their centre of gravity on the right, the French held from Lyumnitsa to the Poroy road, and the British to the right of that road from Loznitsa to Orlyak. On the 12th Sarrail was ordered not to take any action that would involve the British in operations unconcerned with the defence of Salonika itself, and to limit himself to threatening the Bulgarians by a deployment close up to the frontier; and on the 14th he was notified that the French Government had agreed to the British proposal to postpone the offensive.

A few days later, on the 25th, he was informed that though the instructions of the 14th held good in general, events might rapidly make it necessary for him to attack, though with a limited objective, and using the French and the Serbians only; and on July 15 he was told that the British Government had agreed that if Rumania intervened all British troops equipped for mountain warfare should participate in Sarrail's offensive, and instructed to prepare to "pin the Bulgarians on the Greek frontier and put them out of action so far as serious operations against Rumania were concerned." Three days later, on July 17, G.Q.G. informed the French commander that the Entente-Rumanian military convention would probably be signed on the basis of (a) an offensive from Salonika on Aug. 1, to cover the final preparations of the Rumanians and their initial operations against Transylvania; (b) a Russo-Rumanian offensive beginning on Aug. 8, and directed against Bulgaria; and finally (c) a combined advance of the Russo-Rumanian Army and the Salonika forces with a view to uniting and crushing the Bulgarian Army in the field. A few days later a formula agreed upon between the various Allies constituted Sarrail commander-in-chief of the French, British, and Serbian Armies, as also of the Italian and Russian contingents,¹ Gen. Cordonnier being appointed to command the *Armée française d'Orient* as a constituent part of the Allied Army.

Sarrail's new plan was to dispose Milne's available forces on the front Dova Tepe (exclusive)-Lake Ardzan (exclusive) or to the Vardar if possible, to reduce Cordonnier's troops E. of Dova Tepe and Milne's on the Struma front² to a minimum, and with Cordonnier's Army to attack on the front Vardar-Doiran, while the Serbs from above Vodena made their main attack on Huma and subsidiary advances towards the Cerna bend and possibly Monastir. This plan was approved by Joffre, who added that the British Army would receive instructions from the War Office not to limit itself to defensive or demonstrative action. But these instructions, from Gen. Robertson to Gen. Milne, introduced an important limitation in their general approval. Milne was "not to try to take the enemy's positions until an adequate equipment of heavy artillery and other conditions gave a reasonable expectation of success," and the offensive was "not to be taken till Rumania definitely came into the field," an event of which Sir W. Robertson, like Sarrail, had his doubts. Presently came the first hitch in the military convention negotiations. Rumania was not to move till Aug. 14, and Sarrail was to act ten days before that date. But on Aug. 3, the eve of the offensive, the convention was still unsigned, Rumania having expressed the intention of not declaring war on Bulgaria unless large Russian forces were added to her Danube Army; in these circumstances Sarrail's mission

was reduced to "harassing" the Bulgarian Armies on his front, without ulterior purpose, from a date to be determined later (telegrams from Joffre to Sarrail Aug. 3 and 6). Finally, the convention was signed on Aug. 17, without any engagements on Rumania's part to declare war on Bulgaria. On that very day the Bulgarians began to push forward. Proposals for shortening and improving their line by pushing it forward on the one hand from the Monastir frontier towards Ostrovo, and on the other from Rupel to the angle of the Struma, had, in the spring, been put before Falkenhayn by Mackensen (who still commanded, under somewhat indeterminate conditions, the forces of the Central Powers in Bulgaria and Macedonia). Falkenhayn had declined at the time owing to the risk of bringing Greece into the ranks of the enemy. Now, however, it seemed safe to ignore this danger, and desirable to forestall the relief offensive that would doubtless accompany Rumania's intervention,³ and on Aug. 17 a series of encounter-combats began between Sarrail's various groups, advancing for their deployment on the frontier, and the wing elements of the enemy. In the centre, the 17th Colonial Division, the British assisting to some extent,⁴ took, lost and retook Dodselli (Aug. 17-8). But on the left the French cavalry group, already mentioned, which was operating E. of the Struma bend, was driven in by a serious Bulgarian movement from Rupel and through the mountains from the Nevrekop region, and, had it not been that the Bulgarians used part of their forces in taking possession of the coveted coastal strip of Kavalla, the Struma line itself might have been forced. As it was both the French cavalry group and the British force further down the river were able to establish a sufficiently strong defence of the river. On the other flank the Bulgarian attack encountered the Serbians in the process of concentrating forward.

The new Serbian Army, commanded by the Prince Regent Alexander, with Boyovich as his assistant, was organized in three weak "Armies," the I. Army under Mishich, the II. under Stepanovich, and the III. under Yurichich-Sturm, who was shortly afterwards succeeded by Col. Vasich; of these the I. was in touch with the left of the French 12nd Div. about Lyumnitsa, the II. on its left, and the III. formed the left wing, advancing methodically and by short stages towards Banitsa. On the 17th advanced elements of the Danube Div. (III. Army) were driven out of Florina, and on the 18th a hasty counter-attack on that point failed. The Bulgarian Army developed considerable strength (6th and 8th Divs. I. Army) and on the 19th, the Danube Div., attacking again, was flung back a considerable distance to beyond Banitsa. Meantime the II. Army, working up in the Moglena district, repulsed such attacks as were made on it, and continued its deployment in front of the Moglena mountains, the left directed on Kaimakchalan, and the I. Army, between the II. and the French left at Lyumnitsa, remained undisturbed.

¹ A new military convention between the four Central Powers had provided that, in case Rumania declared war on Austria, Bulgaria and Turkey would do so against her.

² On the 18th the French divisional commander asked for British aid to secure his flanks and enable him to hold what he had won. But, Rumania having refused to declare war against Bulgaria, Milne, having regard to War Office reservations, declined and appealed to Sarrail to refrain from putting him, as a soldier, in the impossible position of being an inactive witness of enterprises that had no chance of success without his assistance. Sarrail, however, says that Milne had promised, before the movement on Doiran began on Aug. 10, that although he was not authorized to take the offensive, he would not leave the French with their flanks in the air. Taking these two pieces of evidence together, the only conclusion possible is that the formula defining Sarrail's authority as commander-in-chief was too limited to be of much practical value in ensuring military unity, yet too extended if the Governments desired to preserve their control of policy. Too much was left to interpretation, and the commander-in-chief was obviously exposed to the temptation of planning his operations so as to create the case for the promised assistance. Indeed Joffre's directions of July 15 contained a personal instruction to Sarrail in this sense (see Sarrail, p. 361, telegram 4977/M., 4979/M., and especially 4980/M. *pour le Général seul*). The story of the Salonika campaign can only be understood by bearing in mind the political and personal undercurrents affecting it.

³ In the case of the Italian Division the powers of the commander-in-chief were specially limited. The Russians were, however, unreservedly at the disposal of the French. In general the formula from which Sarrail derived his authority was somewhat similar to that which was agreed upon later in the case of Nivelle. It was far from being a real international command such as that of Foch in 1918.

⁴ The prevalence in that region of malaria, discovered by experience, had caused Sarrail to abandon the earlier project of delivering a principal attack with three French Divisions on the Belashitsa front in the summer months.

Impressed by the attacks on his flanks and in particular that on his left, and limited by the outcome of the Rumanian negotiations to fighting without ulterior purpose—instructed, further, by Joffre (apparently on the 16th) to attack three days after the signature of the Rumanian convention, viz. on the 20th—Sarrail changed his plan. Everything E. of the Vardar was to be defensive, everything W. of it offensive. On the extreme left irregular bands (which Sarrail had formed or subsidized) were to cut communications between Florina and the S., and to work their way into southern Albania, where coöperation had been promised by the Italian troops at Valona. An improvised French brigade was to move over to support the left of the Serbians by an attack round the S. and W. sides of Lake Ostrovo. The Serbian left was to hold up the Bulgarian advance, and the four remaining divisions to attack Kaimakchalan and the range to the E. of that point, supported by part of the French 122nd Div. in front of Lyumnitsa. East of the river, the remainder of the 122nd Div. was to stand fast, the 17th Colonial to attack W. of Lake Doiran and the 57th to demonstrate E. of it, all available British artillery participating in the effort of the 17th Colonial. The British divisions in this region (22nd and 26th) were to follow, and the Italian Div. of Gen. Pettiti, in process of disembarkation, was to relieve the 57th French Div., which was then to be transferred to the left wing. East of Dova Tepe the defensive front was to be under the command of Gen. Briggs and held by the British 28th Div., the French cavalry group (which was to explore on the further bank as before) and part of the British 27th Div., the remainder of Milne's Army being in reserve.

At this date, according to a French parliamentary paper, Sarrail's total force, combatant and non-combatant, inclusive of all details, had a ration strength of about 350,000 (four French, five British, six Serbian, and one Italian division, and a Russian brigade), and a combatant strength of 145,000 rifles, 3,000 sabres, 1,300 machine-guns and 1,032 guns, of which, however, 36,000 British infantry were not available for general service, and the 12,000 Italians only began to disembark in the last days of August.

During the regrouping process the Serbian left was driven back slowly, but in order, and on the 23rd the Vardar and the Danube divisions were about the N.W. corner of Lake Ostrovo with part of Timok, and the French Provisional divisions and the French 122nd Div. were engaged in various partial combats on the line Kaimakchalan-Lyumnitsa. On the Doiran and Struma fronts small engagements were frequent, and the French cavalry group, which again attempted to operate E. of the Struma, was driven in by superior forces with somewhat heavy losses. The Bulgarian attacks, however, as has been said before, had no more serious purpose than shortening the line and sketching out a sort of preventive attack, and they died down about Sept. 1, at which date the position of the Serbian left was practically the same as it had been on the 23rd, while the Struma front was unmolested.

Meanwhile the Rumanians had come into the field, and Bulgaria had declared war upon them. In a directive of the 24th, therefore, Joffre ordered Sarrail to continue to check the Bulgarian advance, thereby fulfilling his mission of protecting the Rumanian deployment, and to prepare for a counter-offensive, the date and objective of which was practically left to Sarrail's discretion. For this offensive Sarrail relieved the 57th Div. from the Dova Tepe front and the 122nd from the Vardar valley front, the Italians replacing the 57th, and the British divisions already on the spot taking over the whole front from Doiran to the Vardar. This enabled a group to be formed under Cordonnier consisting of the French 57th and 156th Divs. and provisional brigade, the Serbian Morava Div.¹ (released from the Lyumnitsa region by the 122nd), the Russians, and the various irregular bands above mentioned. As soon as this group should be ready the offensive was to be launched against the right flank of the enemy's new line. This

¹In the sequel this division was taken to support the Gornichevo attack, and did not join Cordonnier.

was carried out on the whole front on Sept. 10. On the Struma front (Briggs) six British detachments, and another French cavalry group also, were sent over the river at different points to engage and hold the enemy in that quarter. No permanent foothold was gained or sought, and the troops were withdrawn on the 11th. On the Doiran-Vardar front, after heavy bombardments on the 11th, 12th and 13th, a salient in the position of the German 101st Div. was stormed on the night of the 13-14, but given up under counter-attacks on the following day. The French 17th Colonial Div. and the Italians made similar local attacks, and from time to time other *coups de main* took place as well as patrol activity and aerial bombing, with the object of detaining as many troops of the German XI. and Bulgarian II. Armies as possible, while the main attack was being developed W. of the Vardar. This began on the 11th, both for the Serbians and for the Cordonnier group. The former pushed up towards Kaimakchalan and Vetrenik mountains with three divisions (aided by the French 122nd Div. which carried Mayadag) and grouped the Vardar, Danube and Morava divisions for the attack of the mountain pass of Gornichevo W. of Lake Ostrovo. The Cordonnier group, much hampered in its concentration by road difficulties, and by the piecemeal arrival of the formations composing it, advanced to Rakita and Hill 633 on the Kayalar-Banitsa road on the 11th, with the Russians, as flank guard at the mountain pass of Vlachoklisura. On the 12th Cordonnier's main body reached Rudnik, the Russians the mountains 1414 and 1348 N. of Vlachoklisura, and a Serbian liaison group occupied Sotir. On the 13th there was fighting along the whole front from Kaimakchalan to the Russian positions, Cordonnier gaining a line at the foot of the Malareka ridge, and on the 14th the Serbs broke through the hostile line at Gornichevo, capturing 32 guns.

Unhappily, in these operations an acute difference arose between Cordonnier and Sarrail. The former, the man on the spot, conducting his offensive on the methodical lines of the battles of France, from which he had recently come and in which he had played a brilliant rôle, moved too slowly to satisfy Sarrail, who, released at last from all restrictions of higher policy, was determined to signalize his name and silence his opponents with a first-class victory. As to which was in the right it will be for history to say; probably it will be found that this is no more than one of the incidents between a higher command in a central command post and a subordinate command in the field that are so common and indeed inevitable in moments of crisis. But the peculiar factors of this case, personal and international, gave the incident a lasting importance. In the event, the Bulgarians, broken by the Serbians at Gornichevo, were able to retreat across the front of Cordonnier's force and reestablish themselves on the line of the Brod, blowing up in their retreat the important viaduct of Ekshisu.

The battle now entered upon a second phase, which lasted from Sept. 15 to Oct. 30. In this period small actions on the Struma and Doiran front were continued; thus the British sent several detachments over the Struma on the 15th and 23rd, and a more serious move was made on the 30th, when Gen. Briggs initiated a methodical advance which brought him by Oct. 8 to the line Agomali-Elishan-Ormanli with advanced elements along the Belika stream facing Seres. On the Doiran front several local enterprises were carried out by the British and Italians. Meantime, on the Adriatic coast, the Italians were moving onwards from Valona along the Voyusa valley, Premeti being occupied on Oct. 9.

The practical effect of these holding attacks and demonstrative moves on the main battle-front between Vardar and Brod seems, however, to have been much smaller than it had been in the first stage. According to Sarrail twenty Bulgarian battalions were shifted over from the British front to that of the French and Serbians in the last days of September. This was only to be expected. When the real front of battle became definite, merely potential battles ceased to possess effective binding power. But the Struma front, though militarily eccentric, had possibilities in the political sense; an advance on that side threatened the Bulgarian occupation of the Kavalla region

almost before it was established—for the Greek garrisons were still in being. General Milne therefore chose this front on which to exercise such holding action as was possible in the conditions.

On the main battle-front Cordonnier's advance on the left of the new Bulgarian position continued on the 15th and 16th, the Russians in the mountains, combined with a newly constituted French force¹ working round, and the main body moving directly on Florina and the line of the Brod. On the 17th Florina was taken by parts of the 57th and 156th Divs.; on the 18th Sarrail intervened again to press the advance towards the rear of the Bulgarians opposing the Serbians on the Brod and Kaimakchalan front. But, probably from supply difficulties due to the blowing up of the railway viaducts, but also because Cordonnier thought it necessary to clear the mountains on his left before swinging in, the advance came to a standstill again on the 19th. On the 20th the Serbians made an important advance in the region of Kaimakchalan, and held their gains against counter-attack. The Franco-Russian Div. on the extreme left also maintained its positions, and on the 23rd Cordonnier was ready to attack in concert with the Serbians along and W. of the Brod line.² But, meantime, reinforcements were arriving on the Brod from the British front, where the policy of demonstrations had at last been detected by the enemy. On the 24th and following days, while the artillery of Cordonnier's force was being got into position for the attack of the Brod line, and the mountain country W. of Florina was being cleared, the Bulgarians made fierce counter-attacks on the Serbian positions about Kaimakchalan. That point itself had been stormed by the Serbians on the 20th, and their hold was not shaken, but it was the 29th before the whole area was in their possession. On Oct. 3 a concerted attack of Cordonnier and the Serbs was delivered on the whole front from Kaimakchalan westward, while the British on the Struma front developed the holding-offensive already mentioned. This general attack was initiated by a vigorous Serbian push in the mountains W. of Kaimakchalan, and, finding their line turned on its left, the Bulgarians fell back, with only rear-guard resistance, to a position defined by four geographical points: German on Lake Prespa, point 1906 in the Baba ranges, Kenali in the plain, the extremity of the Cerna bend and the ridge N. of Kaimakchalan.

This closed the second phase of the battle. The Bulgarians were being effectively held, at the least. As a relief offensive, coincident in date with a new Russian offensive on Brusilov's front, with the seventh Isonzo battle on the Italian, with renewed efforts on the Somme front, and with the battles of Hermannstadt and Dobrich on the two Rumanian fronts, the Balkan battle in its first two phases accomplished all that could be expected of it. But from the point of view of the Salonika forces it was disappointing, especially to the ardent Serbians who at Kaimakchalan had reentered their own country.

The next phase was the general advance against the Kenali-Cerna bend line. It occupied the period Oct. 4-19, and was marked by even more internal friction than the previous phase. The operations themselves consisted in artillery bombardments and local attacks, in which the Serbs advanced to the Cerna bend (7-8 Oct.) and over the river and on to the plateau N. of Velyeselo (Oct 18-19). Otherwise no important progress was made, and, indeed, a set-back occurred on the 6th, when a French and Russian attack W. of Kenali failed with somewhat heavy loss. General Cordonnier thereupon reverted to the idea of a wider turning movement, but Sarrail, who believed, from the reports of his agents and from incidents on the Serbian front, that the whole Bulgarian Army was ripe for a moral collapse, insisted vehemently on direct action. The frontal attack was carried out on the 14th, for the first time with the aid of gas shell, but it failed, with heavy losses to the French and particularly to the Russian contingent. A violent interview on the battlefield between Sarrail and Cordonnier, in the presence of many Allied officers, completed the disorganization of the

¹ Henceforward called the Franco-Russian Division.

² There was some overlapping of the Serbians and French about Boreanitsa, due to a Bulgarian counter-attack on the 19th.

command. Cordonnier, who was suffering from almost mortal disease, was sent home a few days later, being replaced for the time being by Gen. Leblois, but for some days the Serbian attack on the Cerna bend went on unsupported; until Sarrail took the step of placing the available French forces under the superior command of the Serbian Gen. Mishich with the idea of restoring moral as well as tactical unity to his dislocated offensive. The necessity of continuing it, and the chances of a striking success if it were persevered in, were equally evident. The Bulgarian moral had suffered from stagnation and from the rude shock of meeting an enemy risen from the grave. The German elements of the XI. Army had mostly been withdrawn,³ its commander von Winckler (who succeeded Gallwitz in July) was in early October no longer under Mackensen's orders but under those of the Bulgarian higher command; and Gen. Otto von Bülow, summoned with the staff of the VIII. Army from Lithuania to take general charge of operations in Macedonia, only arrived in the middle of the battle. No higher purpose than gaining time and avoiding defeat was or could be contemplated on the part of the Germans and Bulgarians, and self-sacrifice in such a rôle requires either the constant moral of a professional army, such as that of the old regular divisions of Milne's command, or the crisis-moral of the citizen soldier. In these conditions, although the lateness of the season and the sharp enemy offensive in the Dobruja made a junction with the Rumanians impossible, Sarrail had reason to hope for an important victory. In any event, the turn of events in Rumania (Hermannstadt, Fogaras, Kronstadt), and on the Italian front (eighth and ninth Isonzo battles), dictated a continued offensive towards Monastir.

For some days after the Serbian success at Velyeselo weather and counter-attack prevented their further progress, and this time was utilized by Sarrail in strengthening them with French troops drawn both from the Vardar (where the British took over their line), from the western mountains (where the Italians⁴ relieved them), and from the centre about Kenali, where the weather flooded the country. At the same time the artillery was established in position, the maintenance service organized to supply the battle, and touch gained on the extreme left with the Italian force advancing in Albania,⁵ while Milne's Struma troops made a strong diversion by attacking and carrying Barakli Dzuma (Juma) on Oct. 31. Finally, on Nov. 10, the Serbians with French support opened a new strong attack in the Cerna bend. Between the 10th and the 13th Polog, the ridge to the E., and Iven were taken, while the artillery on the Kenali front kept up interdiction fire to prevent enemy reinforcements from crossing the Cerna; and on the 14th a general attack brought the Serbians to the ridge on which Jaratok Monastery stood, with lesser advances to right and left. The Kenali lines being now completely turned, the enemy on the night of 14-15 fell back, covered by rain and snow, to a position but little in front of the line Peristeri-Monastir-height 1378-Grushtitsa. But this time the advance did not halt. On the 15th, in terrible weather, the French left pushed forward to the Viro brook; in the mountains, though mud was absent, rain and snow were still more violent, but the Serbians continued to progress. On the 17th Mishich's troops, with the French aiding and conforming on their left, captured height 1212, and the 18th they stormed 1378, pursuing to Makovo in the night following, while the French centre and left forded the Viro, the Russians S. of Monastir took Kanina, Zabiani and Holeven, and the Italians, French and Russians in the western mountains developed an outflanking movement right and left of Lake Prespa.

On the morning of the 19th the town of Monastir was found evacuated, and the third phase of the Allied offensive, definitely

³ Apart from staffs, there only remained 17½ battalions and corresponding artillery and army troops.

⁴ A newly-disembarked Italian force relieved these in their position in the Dova Tepe region.

⁵ Apart from the movement of the Valona force up the Voyussa, a fresh Italian contingent had landed at Santi Quaranta and advanced by the Turkish military road to Koritsa, and thence to the region of Ohrida and Prespa Lakes. This line became a regular line of communication.

victorious, closed with the occupation of a line from Krani on Lake Prespa—Saddle 2227—Orizar N. of Monastir—Makovo—heights S. of Staravina—N. slopes of Kaimakchalan.

In view of the weather victory had come in the nick of time. The force of the attack rapidly died out, even the Serbian Army with its positive and eager *moral* being too weary, and all formations being too far ahead of their administrative services¹ to be able to push on. Fighting went on in the Cerna bend till Dec. 12; the French operating in this quarter captured Dobromir on the 21st and height 1050 on Nov. 27, and the Serbs Staravina on Dec. 4; but the troublesome height 1248, overlooking Monastir and the plain, remained in the hands of the Bulgarians, and the town was under shellfire throughout the winter.

By this time the evident defeat of the Rumanians and the consequences of the Venizelist *coup d'état* at Salonika called for a reconsideration of policy. The offensive, considered as a relief offensive on Rumania's behalf, had completed its usefulness, and on Dec. 11, Sarrail was instructed to establish his forces on a defensive line, holding as much of the regained territory as possible and keeping in mind the resumption of the offensive at a date that was to be fixed according to the general plan of campaign for 1917, and particularly according to the date at which the Rumanian Army, reorganized by Gen. Berthelot, should be ready for the field. Meantime, the contingency of rapid action against Greece was to be provided for.

Henceforward, for some months, it is this last element in the problem which governs the action or inaction of the Salonika Armies. In answer to the Venizelist *coup* of Aug. 30, King Constantine began a threatening concentration of troops in Thessaly, on Sarrail's left rear. To this the Venizelist forces, hardly yet in being, were no counterpoise, and Venizelos's policy, which was also that of Sarrail, and as a rule that of the British and French Governments, was to prevent contact between the two Greek parties.² Sarrail therefore drew a neutral zone of some kilometres width from the Koritsa basin to the sea. Nevertheless, throughout the period of his offensive, anxieties for the flank and rear limited the play of such reserves as the Allied commander-in-chief possessed. On Dec. 1 the attempt to enforce the delivery of certain war material to the Entente representatives at Athens produced an *émeute*, in which the Allied landing parties suffered severe losses and the Legations were for a time practically besieged. This affair brought the confusion of the Greek problem to a climax. Though on Dec. 2 Sarrail's demand for authority to advance into Thessaly was refused, and some disjointed efforts at naval and military action led to nothing, sufficient unity of policy was achieved to enable the Allies to deliver an ultimatum on Dec. 14, demanding withdrawal of the Greek forces in Thessaly.³

The policy of the Salonika forces for 1917 was fixed at the Inter-Allied conference held in Rome in Jan., to which Sarrail was summoned. The first conclusion was that Greece was not to be attacked, both for other reasons and especially owing to the effect that any high-handed action would have on American sentiment, which was at that moment in the crisis of deciding

for peace or war. The second was that operations on the front should be governed by a waiting policy—a compromise between Sarrail's demand for forces sufficient for a grand offensive, and Robertson's and Cadorna's demand for a withdrawal⁴—and that the divisions sent or to be sent to Salonika should be liable to recall, in the event either of a crisis on the Italian front, or of one in Palestine. On the other hand the full subordination of the British contingent to the Allied commander-in-chief was agreed to,⁵ and (according to M. Mermeix) Sarrail's personality made so favourable an impression on Mr. Lloyd George that the agitation for his recall came to an end for the time being.

In the first weeks after the end of the battle and these decisions, the Salonika front was for the first time formed as a regular and continuous system. On the right, as far as the Vardar, were the British under Milne, consisting now of the 10th, 22nd, 26th, 28th, 29th, and 60th Divs. (the last newly arrived) with some organized units of the Venizelist forces in support. On the left of the Vardar the national contingents were more intermingled, the Lyumnitsa region being held by the French, the Kaimakchalan—Vetrenik—Duditsa front by the Serbs (6 Divisions),⁶ the Cerna bend by the Italians (1½ Divisions), and the remainder of the front by the French main body, to the command of which Gen. Grossetti was shortly appointed in succession to Cordonnier. The French Army were now being reinforced, and included besides the old 57th, 17th Colonial, 122nd and 156th, the 16th Colonial (arrived early Dec.), 76th (arrived end Dec.), 30th (arrived Jan.) and 11th Colonial (newly formed from odd units on the spot). In all, therefore, there were no less than 21½ Divisions in this theatre at the outset of the 1917 campaign, besides two Russian brigades, and the Greek National Defence Army in embryo. The Italians in Albania are not counted, as they were not under Sarrail's command, and operated entirely as a separate force in their own theatre, interesting the Salonika force only in so far that their positions protected the opening up of the line of communication Santi Quaranta—Koritsa—Lake Prespa. This force was strong enough to hold all its line and yet to have larger reserves than in 1916, for either an offensive northward or a march into Thessaly.

The Bulgarians on their side established themselves solidly on the final battle line of 1916, and improved it on Feb. 15 1917 by the recapture of height 1050 in the Cerna bend from the Italians, who had only shortly before taken up this sector. An attempt to retake it failed on the 28th. The end of active operations against Rumania about the middle of Jan. released additional Bulgarians for the Salonika front. As a beginning Sarrail sent his newly arrived 76th Div. inland to Koritsa⁷ just in time to prevent the seizure of that point by an Austrian force coming down from Pogradets (early Feb. 1917); the division then moved on to clear the Santi Quaranta road—the new alternative line of communications—of bands and make the junction with the Italians in Albania, which at present only existed by wireless and aeroplane. This mission was completed by the meeting of the French and Italian troops at Ersek, Feb. 17, after which the limit between Sarrail's International Army and the purely Italian force of Gen. Ferrero in Albania was fixed at a little N. of that point. The 76th Div. was then

¹ The French on the W. side of Lake Prespa occupied Liskovats, a village on the same latitude as Krani, and then Horesovo.

² The viaduct at Ekshisu was not repaired till Nov. 27.

³ The first battalions organized by the Venizelists were sent to the British front on the Struma. At one time the idea seems to have been entertained of reconquering Eastern Macedonia (Drama—Kavalla region) by means of an advance of these troops, presumably in concert with a British expedition. Nothing, however, was done in this direction. The regular Greek forces on this side, cut off by the Bulgarian invasion, had accepted an offer of internment as "guests of the German Government" (Sept. 14) and been transported to Germany, except a small force which from Seres had made its way to join the Allies.

⁴ In the midst of these events came mutterings of trouble in the Serbian Army. Little is known as to the details, but as early as the beginning of Jan. 1917 a division commander and several brigade commanders and senior staff officers were deprived of their posts; by mid-March over twenty such officers were in prison at Bizerta charged with plotting against the Prince Regent. Finally, a number of them were brought to trial, some being condemned to death (July 29) shot, others sentenced to 15 years' imprisonment.

⁵ The idea of a Salonika front had never had any real support in the British War Office, and the Italian point of view seems to have been that the abolition of an Inter-Allied force in the Balkans would give Italy greater freedom of action in Albania.

⁶ Sarrail had already been released from control of the French G.Q.G. when Joffre left it and was replaced by Nivelle (Dec. 1916).

⁷ Owing to losses the Serbian Divisions were now reduced from the old high establishment and were equivalent in rifle strength to French Divisions, viz. 9 three-company battalions.

⁸ Here, in the previous summer and autumn, French cavalry had operated to disperse irregular bands that were practically bandits, and to intercept communications between Athens and the enemy. For a time Venizelist sympathizers reigned at Koritsa, and the idea of annexing the district to Greece was not far in the background; but in the face of protests from Italy and from Essad's Albanian party at Salonika, Sarrail replaced them by an autonomous government of inhabitants under French protection, a course which he considered would commit nobody and yet give no excuse for the formation of Royalist bands.

reassembled N. of Koritsa, in readiness to participate in the general offensive when this should be ordered.

Meantime the British advance beyond the Struma, originally developed out of the demonstrations made during the first stages of the Monastir offensive, had been consolidated on the line Jenimah—Osman Kamila—Hrostan Kamila—Nevolyen—Kukuluk—Elishan—Barakli Dzuma—Alipsa (Ali Pasha). This position formed a useful bridgehead in case Sarrail should be able to resume the old scheme of an offensive by way of Demir Hisar and Rupel against the Bulgarian communications, and meantime it immobilized a Bulgarian force of approximately equal strength. But the supply of the lines beyond the Struma was difficult and laborious during the winter months, and it was to be expected that the valley would be a hotbed of disease in the summer. On the Doiran front several small local attacks were made on the enemy's positions on and about Dub mountain—the Achi Baba or Hermada of this front.

The scheme which Sarrail intended to carry out was the old scheme of a principal blow from the mountain front in the direction of Demir Kapu, cutting off the defenders of the Doiran and Lyumnitsa fronts. Combined with this, local and subsidiary advances were to be made on the Cerna bend and Monastir fronts, with, to the left of all, an enveloping movement by the 76th Div. from Koritsa by Resna upon the rear of the Bulgarians N. of Monastir. Meanwhile, the British, after exercising a holding action which was to increase in intensity from left to right and culminate in a real attack on Seres, would quickly shift their centre of gravity to Demir Hisar, and thence, by Rupel and the Struma, force their way to a position on the rear of the Bulgarian line of retreat. If, as in 1915, Sofia was to be the ultimate objective—if, in short, the campaign was intended to be a decisive one—the sweep of the extreme left would pass through Uskub and Kumanovo, that of the left centre through Veles and Shtip, while the Italians bore down on Demir Kapu and the British marched on Simitli—a romantically complete success. In many ways, indeed, the scheme is identical with that eventually carried out by Franchet d'Espérey in Sept. 1918. But in both cases there were four postulates:—(a) Greece friendly or under entire control; (b) synchronization of the offensive with those in the main theatres, so that the enemy could not transfer German reinforcements in time to the Balkans; (c) enough men; and (d) enough material. Of these postulates Franchet d'Espérey was in the sequel to possess all four. Sarrail, on the other hand, though (b), the most important strategically, was within his power, had little real security as to (a) and a definite lack of means in respect of (d), and this last ranked as one of the most important factors for the tactical break-through on which all the rest depended. Several of these requisites being absent, Sarrail was under no illusions as to the chances of pushing success to the gates of Sofia. But he considered that there was a possibility, becoming a probability if he were given more heavy guns, of forcing the offensive of his left centre in the mountains so far north-eastward as to compel the evacuation of the Lyumnitsa-Doiran-Beilashitsa front. In the absence of these additional heavy guns, however, the tactical break-through in the Moglena-Cerna region would be a matter of great difficulty, and Sarrail accepted a proposal of Milne that the British holding attack should be delivered on the Doiran front—where its effect on Sarrail's battle would be immediate and tactical—instead of towards Seres. This change of plan, made between Feb. 9 and 10 was due in the first instance to the difficulties of movement in the Struma valley, where exceptionally bad weather had made motor transport almost impossible. But the decision was one of grave importance since the height of Dub, now chosen for the British attack, was one of the strongest points on the whole front, and it was an attack, and not a demonstration, that was intended.

In this form the scheme was accepted by the Inter-Allied conference that met at Calais on Feb. 27—in circumstances of great tension—and Sarrail was ordered to hold the enemy to his ground, and authorized to seize any opportunity which offered itself to inflict real damage. So far this represented

merely the waiting policy of the Rome conference. But an important modification of that policy was implied in the actual instructions to Sarrail, for not only was he told that the plan of operations had been agreed to by the British War Council, but he was instructed to be ready to launch his offensive about April 15—a few days after the date selected for Nivelle's battle on the Aisne—in spite of the fact that no Russo-Rumanian offensive could be expected so soon. That authority should be given for an attack of any kind in the conditions of the time was of doubtful wisdom. But that the conference sanctioned an attack on the strongest parts of the enemy front in order to obtain the very limited results at which it aimed is a fact that is more than difficult to explain. The strategic results that would or might accrue from a break-through in the Moglena region were indeed so great (as 1918 showed) that special tactical risks might fairly be taken to achieve this break-through. But the conference of Calais not only had no great strategic results in mind, but had expressly agreed that the circumstances of the time excluded them. And when, in addition, we find that Sarrail was, at one and the same time, told that the decisive defeat of the Bulgarians was excluded, and instructed to "take"—according to the Calais *procès-verbal*—or "seek out"—according to the French Ministry of War telegram—"every favourable opportunity for inflicting a serious check," we can only conclude that the Calais conference was so preoccupied with troubles nearer home that it could think of nothing better, as regards Salonika, than to shift the responsibility and trust to luck.

But before the offensive period arrived events had already blurred the scheme. The British were to attack the Dub, and demonstrate at other points; the French, Russians and Italians in and W. of the Cerna bend were then to move, and lastly the Serbians were to deliver the principal blow between the Cerna and the Duditsa mountain, E. of which were the French 122nd Div. and part of the Greek "Archipelago" Div. (the first of the Venizelist National Defence formations), ready to drive forward on the Huma-Vardar front so soon as the flank attack had begun to make itself felt. But the Serbians, still angered by the breakdown of joint action in the Monastir battle, and also seriously affected by their internal troubles, refused to move till after the Allied general offensive had opened in France. The Russians were deeply shaken by the revolution in their own country. Weather conditions were terrible, and the zero day of battle was several times postponed, both owing to these conditions and to the slowness with which the preliminary offensives at and W. of Monastir were developing.

As early as March 12 the French 76th Div. had begun its advance from Koritsa on Resna. But owing to snow and to the harrying tactics of enemy irregulars—who were supported by small Austrian forces from Pogradets—it made but little progress, and on March 19 Sarrail suspended the movement. Meanwhile, on the 18th, Grossetti, after several days of local attacks, delivered a larger attack on the front N. of Monastir, which by the 27th had advanced the line in this sector to height 1248, Snegovo and Rastani, with corresponding gains to the left on the spur of Peristeri called Crvena Stena, and to the right about Dobromir and height 1050. Over 2,000 prisoners were taken, and these gains eased the uncomfortable position of Monastir, but they were not pressed, as Sarrail not only held his reserves for the April offensive but sought to disengage part of the troops engaged at Monastir for the same purpose.

On the Doiran front the British attacks began about the middle of March with enterprises intended to secure advantageous positions for the general engagement. On April 22, after several postponements, the artillery preparation began, in terrible weather, and on the evening of the 24th the infantry assault was delivered on a two-division front against Dub and its under-features. The positions of the defence were strong in themselves and strongly entrenched, and, as in the trench-warfare battles of the French front in 1916-17, the attack preparations and especially the prolonged bombardment had given full warning. Along the whole front the infantry reached

the hostile front trenches, but only on the left were they able to maintain the ground won, and nowhere was progress made beyond the first enemy system. Heavy fighting, which only died down on the 28th, was necessary to consolidate the new line, and meanwhile for "climatic and other reasons"—to use the words of Milne's despatch—the rest of the front remained inactive. It was only on May 5 that the other secondary elements of the battle (W. of the Cerna, Cerna bend, Lyumnitsa-Mayadag front) began their artillery preparations. At last, on the 9th—in the case of the British the evening of the 8th—the infantry went forward on all fronts. The British, attacking between the Petit Couronné and Lake Doiran, were repulsed, but they made good an advance further W., where 500 yards in depth were gained over a frontage of two miles; these gains were held and consolidated. On the Lyumnitsa front the French 122nd Div., aided for the first time by Greek forces, carried out methodical advances by fractions at a time, and even for a moment held the Srka di Legen. Elsewhere all holding attacks were repulsed after the usual momentary successes. But the serious feature of the situation was the fact that the Serbians, who were to have been the shock element of the attack and to have begun their advance on the 9th, like the rest, came to a standstill on the 11th after engaging only one of the three divisions between Kaimakchalan and the Cerna. More, they asked to be taken out of the line, and with this the offensive scheme practically collapsed. Sarrail did, indeed, induce them to engage again with two divisions, and on the 15th attacks in aid were delivered or threatened at other points.¹ This time, after some loss, they demanded that the offensive should be abandoned altogether. Already Sarrail had received authority from Paris to suspend operations and establish his defensive line (May 15), and on the 23rd, after the second Serbian disappointment, he issued orders accordingly. It could be claimed, with justice, that these operations had pinned the Bulgarian Armies to their ground, and indeed only one Bulgarian division remained in the Danube theatre, all the rest having been drawn into the Balkans by the developing threat of the offensive. But Sarrail had hoped for much more. His object had been Veles and Demir Kapu at the least, instead of which only slight advances on the Struma, Doiran, Lyumnitsa and Monastir fronts—without exception secondary elements in his scheme—had resulted. The offensive was, in short, a failure, and one, moreover, in which it was palpable that disunity had played the major part.

The reasons are to be sought partly in the Serbian breakdown and partly in the general war situation. Allusion has already been made to the fact that the Serbian Army had for some time been passing through an internal crisis; and to the demands made by the Serbian Government and higher command for tangible evidence that all the Allies would frankly engage their forces in the battle. The engagement of the French and Greeks on the Lyumnitsa front, and above all that of the British on the Doiran front, where attacks were made in earnest, local gains secured, and heavy losses incurred² in aid of the projected main attack, might have been supposed to be an effective answer to this last demand, even though the Italians and French in the Cerna bend showed no great vigour.³ But in fact it is premature to enquire how far a sense of having been left in the lurch in the autumn battle and how far internal troubles respectively contributed to the Serbian refusal. In any case a strong motive at the back of all others was that expressed in the phrase, "What is the use of delivering Serbia if no Serbs are left to inhabit it?" But there were other elements of discouragement. Exalted hopes of a great general advance to victory on all fronts had been dashed to the ground by the Alam battle and its tragic consequences, and they were followed by a revolution in which the war-weariness, soldiers' grievances,

and the tremors of revolution produced alarming mutinies. The Russian contingent was affected not only by the revolution,⁴ but by rumours of what had happened to their comrades in France, and they in turn affected the Serbs. When, on the main front and in the presence of the main enemy, the moral of a homogeneous army was shaken to its foundations, it was not to be expected that on this secondary front a patchwork of contingents, every one of which was exiled from its homeland, would fare any better.

In the midst of these conditions of exasperation the Greek question at last came to a head. M. Jonnart was sent out as Allied High Commissioner, and Sarrail was authorized to invade Thessaly (June 10). He had already begun to prepare a force for this purpose immediately the offensive was abandoned, and, to make certain, other troops went to Athens, to Corinth, and to Itea in the Gulf of Ambrassia, whence a line of supply for the Thessaly force was opened via Bralo. Except for a skirmish at Larisa on June 12 no fighting took place. The dethronement of Constantine and the succession of King Alexander, with Venizelos as his first Minister, were successfully accomplished and most of the troops withdrawn again during July.

But the settlement of the Greek problem came too late to have any influence on operating against Bulgaria. The events of the Spring had affected governmental policies as well as common men's passions. Thus, the British War Office began to withdraw troops for the forthcoming Syrian campaign; the Italian Government began similarly to press for the withdrawal of their 35th Div. for operations in Albania; and the French Government, reconstituted after the Aisne crisis, had made it a definite policy to economize the reduced man-power of France by avoiding battle. Meantime, the Italian advance into Epirus, made concurrently with the French operation in Thessaly, antagonized Greek opinion, the relations of Greeks and Serbians were little better, and those of the French and Italians at the margin of the respective spheres of occupation in Albania none too good. The personalities of the Venizelist, and those of the regular Greek Armies, now to be amalgamated, were inevitably opposed. Finally, Essad Pasha reappeared, with a national Albanian policy and the nucleus of an Albanian contingent.

Sarrail, nevertheless, attempted to maintain a certain military activity; in particular, an enterprise on the extreme left was carried out by a French force under Gen. Jacquemot,⁵ which captured Pogradets (Sept. 11) and thence advanced N. almost to Lin. In Oct. a further advance was made into the upper Skumbi valley, but this was suspended, owing to representations by the Italian Government, and the French then withdrew to Pogradets, leaving Essad's bands to operate in the Skumbi region independently. Finally, the whole front relapsed into practical stagnation.

On Dec. 10 Sarrail was relieved of his command by the new Clemenceau ministry on the renewed demand of the British and Italian Governments, and of General Foch in his capacity as chief of the staff of the French Army. This put an end to a situation which had become impossible. The proximate cause of his dismissal, so far as the French Government was concerned, had nothing to do with Salonika, but was Sarrail's relation to the parties of the Left, who, in the troubled summer of 1917, had become pacifist in character, and were suspected, rightly or wrongly, of dealings with similar elements on the enemy's side.⁶ So far as the Allies were concerned, it was due partly to the personality of Sarrail, and partly to the insistent and thrusting policy of France in dealing with Greece. In effect, the over-

¹ It is only just to record, however, that to the end of the year they continued to take their share in duties in the line. The evidence of Sarrail, especially p. 289, is emphatic as to this.

² The superintendence of this operation was the last service of Gen. Grossetti, who left Salonika on Sept. 24 suffering from poisoning, like his predecessor Cordonnier. He died a few months later.

³ M. Clemenceau in his explanation before the army commission late in Dec. 1917 seems to have laid stress principally on the fact that unless satisfaction was given to the Allies in respect of their complaints against Sarrail, they would not accept a French Commander-in-Chief on the western front. (Mémorial.)

⁴ The British on the Struma took Kupri and Ernekeui on this day. According to Sarrail the British losses in the two offensives were 2000.
⁵ Russian troops on the Cerna bend on the contrary s'est conduit comme à Sarrail (p. 257).

throw of the Constantine régime was the only logical outcome of maintaining a Salonika front at all. But between that logical extreme and the other logical extreme of evacuation, which was always the desire of the British War Office, diplomacy built up a series of compromises which satisfied nobody. It was to the indefinite and equivocal position created by these compromises, even more than to any military factors or personal disagreements, that the positive ineffectiveness of the Macedonian forces was due. It remains to the credit of Sarraïl that he was sanguine in the most confused and difficult conditions and resolute in carrying the occupation to a common-sense issue. In spite of proposals to retreat again into the entrenched camp, he maintained the army on the front from which, nine months later, it was to deliver the great offensive blow for which he had always hoped. On the other hand he left the Allied Army in a state of badly shaken *moral*. The consciousness of ineffectiveness, the blight of malaria, the infrequency of leave, the sense of being a forgotten "side-show," the international causes of friction—all these factors told on the *moral* of the Salonika forces at the most critical period of war-psychology.¹ A period of *remise en main* was necessary before the troops could be employed either in this theatre or in another, and Sarraïl had taken the line of defending his army against all criticism, fair or unfair. It was essential, therefore, if the army was to be pulled together, that new men should be put in power.

General Guillaumat, the new commander-in-chief, set himself to this task under favourable conditions. No important military operations were in prospect. The Greek danger had been liquidated. The atmosphere of exasperation was largely dispersed by his appointment alone. With Russia and Rumania in collapse, and the final military trial of strength obviously imminent in one or both the western theatres, not one of the three great Powers concerned was inclined to press its Balkan interests very closely. His military position, too, soon came to be much stronger than that of his predecessor. Although the British had withdrawn two of their six divisions (the 60th in June and the 10th in Sept. 1917, both proceeding to Syria), and one battalion per brigade in the four remaining (spring 1918), the French and Italian contingents remained practically unaltered (save for the withdrawal of the Russians), while the Serbians acquired a whole new division created from Yugoslav prisoners of war, and the Greeks were taking their place as a regular Allied contingent, the "national defence" divisions at Salonika (Archipelago, Crete, Seres) being augmented by those of the regular army, reorganized by a French military mission.

The question of the use of these forces had been put on one side by the central councils of the Entente. German pressure on the Western Front, beginning with March 21 and culminating on July 15, threw all other questions into the background, and when the tide began to recede it proved as difficult as ever to convince the directors of the War that good could come from a Salonika offensive, while, at the same time, it was impossible to offer the Central Powers the opportunity of repeating at Greece's expense their customary autumn triumph. No decision imposed itself and none was taken. The only event of the early summer was a brilliant *coup de main* with limited objective, which on May 30 carried the Srka di Legen on the left of the Vardar. In July Guillaumat, after practically completing the work of reorganization, was recalled to Paris, where an energetic governor was needed in case of a German breakthrough. He was succeeded by Gen. Franchet d'Espérey. At Paris he continued to act as advocate of, and so to speak agent for, the principles of a Salonika offensive. After much persuading he obtained for his successor authority to prepare one, but authority to begin was not given till a few days before the battle.

Meantime, operations in Albania, which for two years had been in the nature of post and police warfare, rose for a moment in the summer of 1918 to the level of major operations.

In the winter of 1917-18 the posts of the Italian XVI. Corps (Gen. Ferrero) in Albania ran along the Voyusa from the sea

¹ Nevertheless it is clear that the phase of the mutinies passed off more easily than the corresponding phase in France.

to Mamallade, where it turned abruptly N. and then N.E., facing Glava and Cafa Glava, Parasboar, Barguzyal, and Cerevoda. Here it joined the French posts, which ran in a N. to S. line along the mountains to Golik in the Skumbi valley and thence nearly E. to Point 1704 S. of Lin on the shore of Lake Okhrida. Early in July 1918 a frontal advance of Ferrero's Italians from the Voyusa and combined by flank pressure by the French 57th Div. in the mountains of the Devoli regions, forced the two Austrian Divs. (47th and 81st) of Gen. Können-Hozak's XIX. Corps to evacuate the whole Berat region in haste, with a loss of nearly 3,000 prisoners. By July 20 the Italians lay along the Semeni and the lower Devoli from the coast to Petrohaudi (with a bridgehead in front of Fieri), and thence in an E. to W. line to the foot of the Mati Siloes range which was held by the French. The positions of the latter formed a marked salient, the apex of which lay at the confluence of the Holts and Devoli rivers, and the right flank of which passed by Kumichan to Golik on the old front. The importance of this salient lay in the fact that it kept the right wing of the general line echeloned well forward, threatening the rear of the enemy's lines near Berat and ultimately the connexion between Elbasan and Lake Okhrida.

In August the Austrians, now commanded by Generaloberst von Pflanzer-Baltin and reinforced by the 45th Div., as well as by the fresh 12th Bulgarian Div. in the Okhrida-Skumbi sector, began a counter-offensive all along the line. Between August 20 and 24 they recaptured the line of the Semeni and the Devoli and drove back the Italians to positions only slightly in front of Fieri and Berat. On August 24 those towns fell again into their hands, and the Italians then withdrew to a line from just S. of Fieri, along the Janitsa, S. of Berat, and along the Osum to Mt. Tomor. Meantime, the French, the left rear of their Devoli salient being thus threatened, had had to fall back in the Devoli and Tomorica valleys to regain touch with the Italians at Mt. Tomor, while still holding on to their posts between the Devoli and the Skumbi. These operations are of interest as being the last military success won by forces of the Central Powers in the War. Three weeks after their conclusion the Bulgarian front was in ruins.

At the close of these operations and the eve of the final act on the Salonika front, the numbers and positions of the forces of the Central Powers were approximately as follows: In Albania, XIX. Austro-Hungarian Corps (45th, 47th, 81st Divs.) under Generaloberst von Pflanzer-Baltin; between Skumbi Valley and Lake Okhrida the 12th Bulgarian Div.; from Lake Okhrida (exclusive) to Kozlak Mountain (inclusive), the XI. German Army (Gen. von Steuben), consisting of, from right to left, the LXII. German Corps staff, with under it the Bulgarian 1st, 6th and Composite Divs., and some few German and Austrian units, the LXI. German Corps staff, with the 302nd German Div. (staff German, troops Bulgarian), the 4th Bulgarian and the 2nd Bulgarian Div., and the 3rd Bulgarian Div.; from E. of Kozlak to Lake Doiran (inclusive) astride the Vardar, the I. Bulgarian Army (Gen. Nerezov), three Bulgarian Divs.; from Lake Doiran (exclusive) to Lake Tahinos (inclusive), the II. Bulgarian Army (Gen. Lukov), three Bulgarian Divs.; from Lake Tahinos to the mouth of the Struma, thence eastward in coast defence positions, the IV. Bulgarian Army (Gen. Petrov), two Bulgarian divisions. The whole of these forces were under the control of the German headquarters, which had formerly been Mackensen's and Bülow's but was now the *Armeegruppe Scholtz*; Gen. Scholtz was, however, for certain purposes under the control of the Bulgarian higher command, at Sofia, over which Todorov presided. An exact account of the forces of Bulgaria at the crisis can hardly be given,² but, save for one division in Rumania and some coast

² Some of the newer divisions had an irregular constitution whereas the older ones still retained the six-regiment organization of 1915, and some of these even the old four-battalion regiments. Moreover, at that moment movements were in progress for replacing 15 German battalions by 45 Bulgarians; the Germans had departed, all but three battalions, but few of the Bulgarians arrived in the XI. Army in time.

defence units in Thrace and E. Macedonia, the whole of Bulgaria's mobilizable force was present between the Devoli in Albania and the mouth of the Struma. In the depots were practically only the 1919 class recruits, just called up; 55,600 men had fallen in battle since 1915, some thousands were prisoners, many thousands had died or been invalided. Thus the ration strength of the Bulgarian Armies on the Macedonian front can hardly have exceeded 420,000, with some 8,000 Germans (principally Jäger battalions, heavy artillery and mountain machine-gun detachments). The combatant strength may be taken roughly as 310,000 Germans and Bulgarians. The Italians of Ferrero and the Austrians of Pflanzer-Baltin, whose operations in Albania were entirely unconnected with the battle on the main front, are ignored in this calculation.

On taking up their battle grouping the larger formations of the Entente Armies were arranged thus: Devoli valley to Staravina (E. of the Cerna bend), the French Army of the East, in seven French, Italian and Greek Divs.; Staravina to Nonte (exclusive), the Serbian I. and II. Armies under Boyovich (3 Divs.) and Stepanovich (5 Divs.) respectively, the latter consisting of the Strumaja, Timok, and Yugoslav Divs., and the French 122nd and 17th Colonial Divs.; Nonte to Lyumnitsa, Gen. Anselme's group, Greek and French Divs.; Lyumnitsa to Dub (exclusive), astride Vardar, 26th and 27th British Divs.; Dub to Dova Tepe, 22nd and 28th British and two Greek Divs.; Dova Tepe to mouth of Struma, 3 Greek Divs.; Salonika, 1 Greek Div.; in all, 28 divisions. In addition there were a small Serbian cavalry Div., a French cavalry brigade, and other lesser formations and details. The ration strength of these forces, after making allowances for men invalided during the hot months, was about 550,000, and the combatant strength perhaps 350,000.

In sum, then, there was no great numerical disparity between the opposed forces. The equipment of the Entente Army in heavy artillery was, however, considerable. Sarrail's repeated requests for an adequate equipment in this respect had been in the end met, just before his recall. As to the number of heavy batteries on the other side accounts differ, but in any case the regrouping of guns to meet an attack, in the movement conditions of Macedonia, would be difficult if not impossible for the defence, and the mere possession of a reserve of such artillery was, in the conditions, a big element in favour of an attack, provided the duration of the artillery phase of it was reduced to a minimum. On the other hand, to oppose to the powerful material of attack, the Bulgarians had all the advantages of natural and artificial strength of position. But the success or failure of an offensive would turn more on *moral* than on material factors. Presuming that the tactical break-through was possible, would the Bulgarians knit up again on a new line further back? Or would it be found that the third winter had completed the war-weariness on which Sarrail had twice vainly counted, so that one heavy blow would finish the matter? In the light of events the answer is easy. The new government in Bulgaria was pacifist in character. Ludendorff regarded a breakdown as almost certain and detailed several divisions from the eastern front early in Sept. to proceed to Bulgaria and Serbia, the nearest indeed being ordered to Sofia to keep order. On the front itself, according to German accounts, conditions were "indescribably pitiful," and for food the greater part of the troops were dependent on ox-transport from a base 60 m. distant, and upon what they had themselves grown behind the lines, this last fact indeed making it almost impossible to induce a unit to quit its sector for a concentration. But 1917 had for the Entente been a tragedy of disappointments founded on optimistic estimates of the enemy's broken *moral* and vanished man-power, and in 1918 not unhealthy scepticism prevailed in their intelligence staffs, although it was agreed that Bulgarian *moral* was low. Then, too, there was the question of Serbian *moral*. Since the débâcle of May 1917 the Serbians had considered it a principle that it was useless to rescue Serbia, and they left it to inhabit it, yet they alone possessed the *moral* which would convert tactical victory into

strategic triumph, who would disregard food and rest sufficiently to exploit success by leaps and bounds, who would not stop short of the Danube. And nothing less than victory without remainder would be of any value to the Entente.

When the plans were under consideration this latter question was unexpectedly answered by the Serbs themselves. They proposed an offensive with limited objective in the Moglena sector, i.e. that lying between Kaimakchalan and the Srka di Legen. At once the situation was cleared up. If they were ready to carry out an attack on the mountain front for no more than a limited objective, it was unlikely that an offensive from that group with the objective of Belgrade would not fall to pieces as in 1917. On June 29 the plan was definitely fixed, and about July 7 the Serbian headquarters (now directed by Mishich) agreed to engage all its forces in the operation. The date of the offensive (which needed a good deal of material preparation as the Moglena sector had never been equipped for battle) was fixed for Sept. 15, though, owing to objections and preoccupations in Paris, the higher command did not give leave to carry it out till little more than a week before that date (Sept. 4).

On Sept. 14 a bombardment opened which, less overpowering than those of the western front, was far heavier than anything previously witnessed in the Balkans. Next day—the original date—the offensive was launched. From the Lechnitsa river to the Sokol mountain the I. Serbian Army (Boyovich), consisting of the Danube, Drina and Morava Divs., had a frontage of 5 kilometres per division. From Sokol to the Suchitsa brook the II. Serbian Army (Stepanovich) formed the break-through force. In front of the Dobropolje were the two French assault Divs. with the Shumaja Div. on their right, and the Exploitation Divs., Timok and Yugoslav behind them. The I. Army and the Exploitation Divs. were not to move till the French had carried Sokol, Kravitsa and Vetrenik heights. Then, passing through, the Yugoslav Divs. were to master the Koziak, and the II. Army front was to advance at the utmost speed on Gradsko, flanked by the I. Army on the left and the Timok Div. on the right.

The attack succeeded according to programme. It continues to be a matter of controversy whether the Bulgarians offered an earnest and fierce resistance. The impression left on the Allied infantry was that they did so; the Germans in their midst assert the contrary. In any case, it is probable that the backbone of resistance was the German mountain machine-gun detachments which were dispersed in the battle zone. Be this as it may, the French Assault Divs. carried their objectives by the evening of the 15th, the Yugoslav Div. passed through them in the night of the 15–16, carried Koziak on the 16th, and on the 17th drove a deep wedge, of which the point was armed midway between Gradsko and Demir Kapu, and the lengthening left flank along the Cerna was taken up by the I. Army. On the other side there was little or no tactical handling in the ensemble. Machine-gun groups and specially resolute parties of riflemen in broken ground constituted the whole resistance. This, indeed, was the typical form of defence in all theatres of war by 1918, but here it lacked the essential element of organized counter-attack. Here and there a unit turned upon its pursuers, but in the main the rear of the enemy's position was void of reserves, although it is said that only 12,000 Bulgarian and German infantry were in line on the front attacked. Later, all attempts at reinforcement always failed, as the troops concerned had to traverse instead of following the valleys and ridge-systems. In sum, by the 19th, the wedge had developed two horns, of which one, following the Cerna, was at the outskirts of Kavadar, and the other was engaged in rolling up the front opposed to Anselme's group.

Meanwhile, on the 18th, the British and Greeks of the Doiran front, under orders from Gen. Franchet d'Espèrey, assaulted the whole enemy line from the Vardar to beyond Lake Doiran, with the general idea of cutting the communications between the Bulgarians opposed to Anselme, and the apex of their own country at Strumnitsa. Here, at any rate, the Bulgarians

fought vigorously. Their positions were as strong by art as the Moglena positions were by nature, or stronger, and the attack lacked depth owing to the detachment of a division to work with Anselme's force, and to the low effective strength of units.¹ Thus it met with the same fate as those of 1917—small gains of ground consolidated and held after far larger gains had been for a moment achieved. A second attack next day was no more successful. But for these critical days a large force of the enemy had been completely held.

On the 20th and 21st the exploitation of the break-through was completed. The Serbian I. Army, no longer simply guarding the flank of the II., crossed the Cerna and began a drive along the mountains of the Cerna bend to which the Italians and the French of the "A.F.O." conformed little by little. The Serbian II. Army reached the Vardar between Krivolak and Demir Kapu, and its right horn continued to push due eastward along the mountain positions in front of Anselme's force, which progressively came into action from left to right. By the afternoon of the 21st the Doiran-Vardar front was in collapse, and the British aeroplanes were bombing the intermingled troops and transport of the enemy which was seeking to make their way through Kosturino to Lyumnitsa.

From that day, though progress was sometimes slow, sometimes fast, the Allied offensive became a strategic pursuit in the full sense of the word, marked by a consistent policy of outflanking, as rapidly as possible, any solid line of resistance which the enemy managed to create. Thus, on the 24th, the resolute front offered by a hastily assembled German force on the line of the Vardar near Gradsko (the administrative centre and organized base of the enemy's centre) was turned on the N. by the steady advance of the Serbian I. Army on Veles (24th-25th), and once released thereby the Serbian II. Army marched at high speed on Shtip (25th), Nochaua (26th), and Tsarevo Selo (27th), behind the rear of the forces that were giving ground before the British, who in turn worked down the Strumnitsa basin and (in concert with the Greeks further to the right) ascended the upper Struma region, with their aeroplanes sent ahead to bomb the Kresna defile.

Thus, too, when infantry fighting threatened to become stable between Veles and Shtip, the French cavalry brigade under Gen. Jouinot-Gambetta, instead of becoming involved in the Veles fighting, made an independent dash upon Uskub, and to the astonishment of both sides seized that vital centre on the morning of the 29th. This event, which secured the communication between the (so-called) XI. Army and the remainder of the Bulgarians, forced the latter into the region of Egri Palanka, and the former into that of Kosovo. Thenceforward the I. Serbian Army, with the upper Morava as the axis of movement, moved steadily northwards with its right on the Bulgarian border, and its left following approximately the line Gilau-Kinshumlia-Kraljevo, reached Racha-Krushevats-Pirot on Oct. 15, Kraljevo-Parachin-Zajechar on Oct. 23, Pozharevats-Arangyelovats-Uzhitscon Oct. 28, Belgrade-Lyuboviya on Nov. 1, and the old barriers of the Drina, Sava, and Danube on Nov. 4. Meantime, the II. Army had reconquered Kosovo and the Sanjak of Novipazar, reaching Priboy and Plevlje on Nov. 1. By that time the strategic pursuit further E. had become a series of movements authorized by the terms of an armistice, and to the W. Pfanner-Baltin was evacuating in turn Albania and Montenegro, with, as his only purpose, the maintenance of his divisions as formed military units. The Balkan Campaigns were at an end.

For the Salonika campaigns 1915-17, the principal authority is Sarraill's *Mon Commandement en Orient*, which is profusely documented; with this should be taken Gen. Milne's despatches. The German part in the Cerna bend battles of 1916 is described in K. Lubmann's monograph *Herbstschlacht in Mazedonien*, written from official archives. The crowning offensive of 1918 is dealt with fairly fully in C. Photiades *La Victoire des Alliés en Orient*. (X.)

SALTING, GEORGE (1835-1909), British art collector, was born at Sydney, N.S.W., Aug. 15 1835. His father, a Dane, had

¹ At that time influenza was raging in the British force.

made a large fortune by sheep-farming and sugar-growing, and on inheriting this Salting devoted himself to collecting, with great taste and discrimination, Chinese porcelain and English and French furniture and pictures. He led a very simple life and was of retiring and somewhat eccentric habits. On his death, which took place in London Dec. 12 1909, it was found that his priceless treasures had been left to the nation. They are now housed in the Victoria and Albert Museum, the British Museum and the National Gallery.

SALVADOR (see 24.06).—The estimated pop. in 1912 was 1,167,425; in 1917 1,700,000, indicating a pop. denser than that of any American republic except Haiti. In 1918 births numbered 49,783, deaths 33,884 and marriages 3,653. Of the births 21,598 were legitimate and 28,255 illegitimate. Most of the upper class are of European descent and reflect European influences; the lower class has a higher standard of living than has that of Nicaragua or Guatemala. The agriculturists are prosperous and alert; few of them are foreigners. Coffee is the principal crop; some 70,000,000 lb. a year are normally exported to the United States, France, Germany, etc. It constitutes 86% of the total exportation. In 1916 there were 153,517 ac. under cultivation, containing 95,000,000 coffee-trees. The 1917 crop was damaged by the great earthquake of June 7, which partly destroyed five towns. Other products are cacao, tobacco, rubber and sugar. Cultivation of cotton and wheat is being encouraged. Corn is extensively raised, because of the domestic demand. Live stock was estimated in 1919 at 284,013 head of cattle, 74,336 horses, 21,457 sheep, and 422,980 hogs. Mine products include gold, silver, iron, copper and mercury. There are native mining companies as well as English and American. The gold output runs about \$1,500,000 per annum.

Foreign trade is in the hands of English, Dutch and German exporters and wholesalers. Its annual value 1912-8 was:—

	Imports	Exports
1912	\$6,744,859	\$ 9,942,184
1913	6,173,545	9,938,724
1914	4,958,624	10,796,493
1915	4,022,167	10,563,871
1916	5,668,000	9,970,000
1917	2,719,095	10,588,900
1918	5,979,000	12,069,000

In 1919 the exports to the United States were \$4,146,113, the imports from the United States \$5,821,920. National revenues and expenditures, in pounds sterling, were reported as follows:—

	1915-6	1916-7	1917-8	1918-9	1919-20
Revenues	£ 850,114	£ 908,325	£ 1,998,810	£ 1,382,644	£ 1,670,096
Exp'd't's	1,058,219	916,704	1,013,842	1,874,079	1,692,692

The estimated revenue for 1920-1 was stated at 14,726,170 colones, and expenditures 16,227,580 colones, leaving a deficit of 1,501,410 colones. The colon was fixed at \$0.50 by law of Sept. 11 1919. Prior to that time it was normally worth \$0.3978, but in 1917 it was worth \$0.60 and by Dec. 31 1918 \$0.72. The national debt at the end of 1918 was \$11,098,000.

Education has long been nominally free and compulsory, but until recently received little attention from the Government. In 1911 there were 173,495 children of school age and only 21,569 in primary schools, which numbered 486; in 1916 only about one-fourth of the 245,251 children of school age were in the 989 primary schools. In the principal towns the schools have done excellent work, though with poor accommodation. In rural districts there were in 1916 only three grades, with a fourth year of industrial instruction added. The lower classes were thus purposely left without educational facilities in order to exclude them from the professions. The secondary schools, of which there are 27, lacked trained teachers and funds, as did the National University. In the latter, graduates of the secondary schools are offered courses in jurisprudence, medicine, pharmacy, dentistry, and engineering. In 1919 a law for eradicating illiteracy was enacted, and a campaign begun to reduce the proportion, then 70%, ignorant of the alphabet. The budget estimate for 1920-1 contained an appropriation of 1,831,374 colones for education. Other social measures were a campaign against alcoholism inaugurated by the Superior Council of Health, and the inception of a federation of working-men's societies.

History.—After 1909 Salvador remained substantially at peace within her borders and with her neighbours. President Fernando Figueroa was succeeded by Manuel Enrique Araujo

in 1911, but the latter was murdered in 1913 and succeeded by the vice-president, Carlos Meléndez. He resigned in Aug. 1914. Alfonso Quirón Molina temporarily held the presidential power and when Carlos Meléndez was elected president in 1915, Molina became vice-president. On March 1 1919 Jorge Meléndez was inaugurated for the term ending 1923. The tranquil condition of Salvador was due to the decrease of hostility between Conservatives and Liberals, and to the frequent insistence by the United States upon the preservation of peace.

During the World War Salvador was the only one of the five isthmian republics which did not declare war against Germany, although, by note of Aug. 24 1917, she permitted U.S. vessels, regardless of armaments, to use her ports. When the Monroe Doctrine was adopted without definition in the Covenant of the League of Nations, she interrogated the U.S. Government as to the interpretation of the doctrine; later, in 1920, a movement was made to initiate an international bureau or court excluding the United States from membership, but this movement gave way to another looking toward Central American union, which Salvador had long advocated.

On June 24 1920 the Salvador Department of Foreign Relations sent a circular telegram to the other four isthmian republics inviting their participation in an isthmian congress to review, and, if needful, change the Washington Conventions of 1907, which were intended to safeguard the interests of all Central American countries and to promote the settlement of difficulties through arbitration. The congress was also to plan for unification of the national constitutions and law codes, provision for uniform secondary and professional education, equalization of customs duties with free trade in Central American products, adoption of uniform extradition laws, moneys, weights and measures, and a single coat of arms and flag. From such unification political consolidation was expected to ensue. Conferences began Sept. 15 1920. Nicaragua seemed for a time to prevent complete accord, but a preliminary agreement as to union was reported as having been effected Jan. 21 1921. To this pact of union Salvador, Honduras and Guatemala became signatories; Nicaragua and Costa Rica rejected its terms, which became effective Feb. 10 1922. Salvador has an arbitration treaty with the United States, ratified in 1913, and a treaty encouraging commercial relations, ratified in 1919. (H. I. P.)

SALVINI, TOMMASO (1829-1915), Italian actor (see 24.103), died at Florence Dec. 31 1915.

SALZBURG (see 24.104), a Territory of Austria, borders for a considerable distance on the Italian Tirol. In 1910 it had 214,737 inhabitants; in 1920 only 213,877 (77 to the sq. mile). In 1900 16.0% of the soil was unproductive. The productive areas included 39.2% forest; 39.8% grazing lands, mostly high-lying; 9.8% meadow; 0.3% gardens; and only 10.8% arable. The most important towns are Salzburg (pop. in 1920, 36,450); Hallein (pop. 6,746); St. Johann, in Pongau (pop. 1,709). The opening of the Tauernbahn has greatly increased the importance of Bad Gastein and Hof Gastein, and the latter has developed into a modern health resort. The Gastein springs are rich in radium.

SAMSONOV, ALEXANDER (1859-1914), Russian general, was born in 1859. After being at the Cavalry school in St. Petersburg he served in the war with Turkey in 1877-8. On passing out of the Academy of the General Staff in 1884 he was appointed on the general staff. From 1896 to 1904 he was commandant of the Cavalry school at Elisavetgrad, and in 1902 he was promoted to the rank of general. In the war with Japan in 1904-5 he commanded the Ussuri mounted brigade and the Siberian Cossack division. He distinguished himself greatly as a leader of cavalry, and was awarded the St. George Cross of the fourth class. In 1909 he was made Ataman of the Don Cossacks, and in the same year he became governor-general and commander of troops in Turkestan. In Aug. 1914 he was appointed commander of the II. Army, which was concentrated on the Narev. Sentiments of loyalty to an ally and the desire to take pleasure off France at the earliest possible moment led the Russian supreme command to give a premature order into eastern Prussia. Notwithstanding his

report that his army was not ready for an advance the order was repeated, and as a result of the absence of support from Rennenkampf's I. Army Samsonov's army was destroyed in the battle of Tannenberg on Aug. 26-29. Convinced that the battle was hopelessly lost, he gave orders to his staff to extricate themselves from the German ring, while he went into a wood and shot himself. He was buried, with other Russian soldiers, not far from Villenberg. His wife, coming later to Germany with the Red Cross, recognized his body by a medal that he wore.

SAMUEL, SIR HERBERT LOUIS (1870-), British politician, was born at Liverpool Nov. 6 1870, the son of the banker Edwin Louis Samuel. He was educated at University College school and Balliol College, Oxford, where he took his degree in 1893. In 1895 and 1900 he unsuccessfully contested South Oxfordshire as a Liberal, but in 1902 was elected for the Cleveland division of Yorks. He entered Sir Henry Campbell-Bannerman's Government in 1905 as Parliamentary Under-Secretary to the Home Office. From 1909 to 1910 he was Chancellor of the Duchy of Lancaster, with a seat in the Cabinet, and in 1910 became postmaster-general. He held this office until 1914, and then came for a year president of the Local Government Board. From 1915 to 1916 he was again postmaster-general and Chancellor of the Duchy of Lancaster, and in 1916 became Home Secretary. He acted as chairman of the select committee on national expenditure (1917-8), and in 1919 was a British special commissioner to Belgium. In 1920 he was appointed high commissioner to Palestine and was created G.B.E.

SANDAY, WILLIAM (1843-1920), English theological scholar, was born at Holme Pierrepont, Notts., Aug. 1 1843, the son of William Sanday, a well-known breeder of sheep and cattle. He was educated at Repton and Balliol College, Oxford, afterwards becoming a scholar of Corpus Christi. He took a first-class in classical moderations in 1863, a first in the final classical schools in 1865, and was ordained in 1867. He became a fellow and lecturer at Trinity in 1869, and in 1876 was chosen principal of Hatfield Hall, Durham. In 1883 he was appointed Ireland professor of Exegesis at Oxford, and in 1891 Lady Margaret professor of Divinity, a post which he held till 1910. He died at Oxford Sept. 16 1920.

As a theological and biblical critic of the apologetic school Sanday took a very high place. His chief works are *The Authorship and Historical Character of the Fourth Gospel* (1872); *The Gospels in the Second Century* (1876); *The Oracles of God* (1891); *The Early History and Origin of the Doctrine of Biblical Inspiration* (1893); *Commentary on the Epistle to the Romans* (with Dr. Headlam, 1895); *Outlines of the Life of Christ* (1905); a republication of an article in *Hastings' Dictionary of the Bible*; *Christologies, Ancient and Modern* (1910) and *Personality in Christ and in Ourselves* (1911).

SAN FRANCISCO (see 24.144) increased in pop. during 1910-20 from 416,912 to 506,676 or 21.05%, making it the eleventh city in the United States. The metropolitan district, as designated by the U.S. Census Bureau in 1920, included all the communities in the extensive area surrounding San Francisco bay. This area had in 1910 a pop. of 750,000 and in 1920 1,121,631, being the fifth population centre of the United States.

Transportation and Commerce.—The railway service of San Francisco was greatly improved in the decade 1910-20. In 1917 the Southern Pacific spent approximately \$1,500,000 on yards and carshops in the city. The other railways correspondingly improved their terminal yards on the bay. Steamer service grew remarkably, in part because of the opening of the Panama Canal. In 1911 the ship tonnage of the port was 5,319,556 entered and 5,545,530 cleared. In 1919 4,617 vessels entered the port and 4,696 cleared, carrying a gross tonnage of 12,261,669. In 1920 the 48 steamship lines operating out of the port had over 250 steamers; 29 lines were in foreign and 19 in coastwise trade. The U.S. Shipping Board in allotting ships gave the port 250,000 tons, including seven ships of 21,000 tons each. The urban railway mileage increased from 289.6 m. of single track in 1910 to 352.88 m. in 1920. The opening of a municipal line in Dec. 1912 caused the retention of a five-cent fare. The number of passengers carried during the fiscal year 1919 was 307,000,000 as against 157,722,720 in 1911. The south-western quarter of the city was brought within 25 minutes of the business district by building a tunnel under Twin Peaks (1917). In 1921 the port of San Francisco had 41 modern piers with a total area of 4,500,000 sq. ft., providing for more than 1,200,000 tons of cargo per month, an increase of 100% over the accommodation available in 1910. The Belt railway, which serves all but three of the piers, had in

1920 54 m. of track. A tunnel under Fort Mason, connecting the Government docks and the Presidio with the Belt line, was completed in 1914. The harbour was self-supporting, paying all maintenance, interest and redemption of bonds. In 1911 the people of the state voted \$9,000,000 and in 1914 \$10,000,000 in bonds for port development. In 1920 the harbour board approved plans for an extensive combination dock and warehouse, accessible by ship and rail. The freight discharged and landed over the wharves of the port of San Francisco, exclusive of federal and private wharves, increased from 6,866,148 tons in the year 1910-1 to 10,257,612 tons in 1918-9. The foreign trade of the port in the period 1909-19 increased 274% while the increase for the United States during the same period was 107%. The value of the foreign trade for 1920 was: exports \$220,257,771, imports \$212,021,768, a total of \$432,279,539. The tonnage movement for the same period was: outgoing 7,033,480, incoming 7,183,042, total 14,216,522.

Industries and Finance.—Since 1916 shipbuilding has been the most important industry of San Francisco. In the three-year period 1916-9 there were constructed in the metropolitan district 97 cargo ships of a total of 945,783 tons and 110 naval craft, including three super-dreadnoughts. In 1920 there were completed 68 cargo ships of 607,650 deadweight tons.

In Jan. 1921 the estimated number of factories in the city was 2,500, employing more than 55,000 wage-earners. The principal industries, with the estimated value of their product in 1920, were printing and bookbinding, \$20,000,000; fruit and vegetable canning, \$15,000,000; slaughtering and meat-packing, \$20,000,000; foundry and machine-shop products, \$17,500,000; lumber and timber products, \$7,500,000.

Bank clearings increased from \$2,427,075,543 in 1911 to \$8,122,064,916 in 1920, placing San Francisco eighth in the United States in bank clearings. The assessed valuation of property in 1920 on approximately a 50% basis was \$819,820,078.

Public Works.—The plans of the city in 1910 to own its own water supply culminated in the Hetch-Hetchy water and power project. The city owns a watershed of 420,000 ac. in the Sierras on the headwaters of the Tuolumne river, 160 m. distant, from which 400,000,000 gal. of water can be secured daily and 250,000 H.P. produced. The work of development was well under way in Jan. 1921. A railway 68 m. long to Hetch-Hetchy valley and the Lake Eleanor dam were already built, over 18 m. of tunnel were under construction and a hydro-electric plant of 4,000 H.P. was in operation. The contract for the Hetch-Hetchy dam was let for \$5,400,000. Bonds for \$45,000,000 were issued and \$8,000,000 spent by March 1921.

Buildings and Parks.—The value of private building operations was \$22,873,942 for 1910, \$18,626,199 for 1915, \$18,644,343 for 1919, and \$32,866,009 for 1920. Among the notable public buildings are those of the Civic Center, located in the heart of the city and surrounded by a plaza. They consist of three main buildings: the city hall, costing \$4,000,000; the auditorium, with a seating capacity of 12,000, given by the Panama-Pacific International Exposition and costing \$1,275,000; and the public library, costing \$1,000,000. A state building costing \$1,000,000 was in Jan. 1921 in process of construction near the Civic Center. Among recent buildings were the First National Bank, American National Bank, Robert Dollar building, Balfour building, Bank of Italy and the Southern Pacific building. The Exchange building, the building of the California Title Insurance Co., the Crocker building and the Furniture Exchange building were under construction in March 1921. In Jan. 1921 there were 34 parks in San Francisco with an area of approximately 2,500 acres. The Golden Gate Park Memorial Museum had been completed. Nine playgrounds were in use and several more under construction. The public library, as part of the Civic Center, was in 1921 housed in a magnificent building; there were also nine branches and 13 deposit stations with a total of 240,000 volumes, with a home circulation of 1,368,685. The Palace of Fine Arts of the Panama-Pacific International Exposition was given after the fair to the San Francisco Art Association; many of the art treasures shown in 1915 remained there. In Feb. 1921 ground was broken in Lincoln Park for a California Palace of the Legion of Honor as a memorial to the Californians who gave their lives in the World War and as a museum of art.

Education.—In 1920 there were 107 public schools, including high schools, with 1,028 teachers and an enrolment of approximately 80,000 pupils. The University of California, at Berkeley, and the Leland Stanford Jr. University, at Palo Alto, each had important teaching departments in San Francisco.

History.—The opening of the Panama Canal was celebrated, Feb.-Dec. 1915, by the Panama-Pacific International Exposition at San Francisco, representing an investment of \$50,000,000. The exhibits, numbering about 80,000, were valued at \$300,000,000. Thirty-nine foreign nations and 37 states and three territories of the United States were represented at the exposition. The attendance began with 245,000 on opening day, Feb. 6, rose as high as 348,500 on Nov. 2, San Francisco Day, and reached a total of 18,500,000. The architecture was of a highly varied and monumental character. One of the artistic merits of

the exposition was its effective colour scheme, while the night illumination was extremely ingenious and impressive. In spite of the World War the foreign exhibits were remarkably complete. Financially as well as artistically the exposition was a success. After presenting to the city of San Francisco the auditorium already noted, the exposition authorities had on hand a final net profit of a little more than \$1,000,000. The whole enterprise had been undertaken without Government subsidy; the city and state, however, appropriated \$5,000,000, while private contributors added \$7,500,000 more. Receipts from concessions were \$7,809,565 and from admission fees \$4,715,523. The beginning of a new era in world trade, which the exposition celebrated in connection with the opening of the Panama Canal, was delayed by the World War, but with the resumption of normal conditions trade increased. Following the prosecutions begun in 1907, corruption in the city government was largely eliminated, but it reappeared, though on a smaller scale, after 1909. The election under a new primary system in 1911 of a mayor and city government opposed to "graft" brought in an era of reform. In Dec. 1911, by an extension of the city charter, members of the police and fire departments were placed under civil service. A number of other charter amendments were made during the decade 1910-20, but there was no material enlargement in the power of the city.

(R. A. V.)

SAN GIULIANO, ANTONINO PATERNO-CASTELLI, MARQUIS DI (1852-1914), Italian statesman, was born at Catania in 1852, a member of a very ancient and noble Sicilian family. After graduating in law at the university of Catania, he began his public career in the field of local politics and in 1879 was chosen mayor of his native city. In 1882 he was elected to parliament and proved an active worker on committees, speaking frequently and well on foreign and colonial affairs, railway, agricultural, social and fiscal problems. In 1891, as member of the committee of inquiry on Eritrea, he opposed the African policy of both the Crispi and the Rudini Cabinets. When in the following year Sig. Giolitti became premier, the Marquis di San Giuliano was selected as under-secretary for agriculture, while in the Pelloux ministry (1899-1900) he held the portfolio of posts and telegraphs. During the next few years he devoted himself to travel in the near East and in North Africa and to the study of the problems concerning those regions. Having been defeated at the elections of 1904, he was nominated senator; in parliament he had long been a staunch follower of Sig. Sonnino; but when, in Dec. 1905, Sig. Fortis became prime minister, he accepted the post of minister for foreign affairs, and on the fall of the Cabinet early in 1906 he was appointed ambassador in London, where he remained until 1908, gaining much popularity and contributing to render Anglo-Italian relations ever more cordial. He enjoyed the special regard of the late King Edward VII., who afterwards visited him at Catania. From London he was transferred to Paris; but he soon returned to the Consulta as member of the Luzzatti Cabinet (1910-11), and continued at the same post in Sig. Giolitti's administration. In the autumn of 1911 the crisis with Turkey broke out, and it is believed that it was he who convinced the premier of the national necessity for the Italian occupation of Libya. During the whole tenure of office the Marquis di San Giuliano was an ardent believer in the Triple Alliance, on which he thought that Italy's foreign policy should be based, and attached the greatest importance to a good understanding with Austria, an attitude not calculated to win him popularity in many circles; under his guidance consequently Italy opposed Serbia's desire for a port on the Adriatic and Greece's aspirations in Epirus, and supported the policy of creating an independent Albanian State. On Giolitti's resignation in March 1914, San Giuliano retained office under Sig. Salandra, at the latter's urgent request, and was soon faced by the responsibilities arising out of the outbreak of the World War. Public opinion was inclined to attribute the declaration of Italian neutrality to the premier rather than to the minister for foreign affairs. But it is certain that, once the decision had been taken, the Marquis di San Giuliano carried out the policy it involved with the most complete loyalty.

The strain and overwork, however, of the three years of office together with grief at the death of his only son in 1912, had told on his constitution; and after an acute attack of gout, he died in harness at the Consulta on Oct. 16 1914. He was a man of wide literary, historical and artistic culture, a Dante student, and the author of several books and articles on social questions, the conditions of Sicily, foreign affairs, etc.; his *Lettere dall'Albania* are deservedly appreciated, and his geographical studies led to his being elected president of the Italian geographical society.

SAN MARINO (see 24.153), area 38 sq.m., had in 1920 a pop. of 12,069. The estimated revenue for the year ending March 31 1921 amounted to 34 million lire, derived mainly from customs; tobacco, matches and salt monopolies; and taxes on patrimonial estates and on urban and rural lands and buildings. There is no public debt. The regents (*Capitani Reggenti*) exercise executive power through four principal committees nominated from the supreme "Council of Twelve," viz.: a *Congresso Economico di Stato, dei Legali, degli Studi and Militare*. A "treaty of good relations and friendship" with the kingdom of Italy, concluded in 1807, was revised and renewed in 1908, 1914 and 1920. The republic has extradition treaties with England, Holland, Belgium and the United States and is represented by Consuls-General at Rome, London and Barcelona and by a *chargé d'affaires* at Paris. England also has an accredited representative resident in Florence. During the World War, though nominally neutral, the republic took a share in providing hospital equipment for the Italian front and put no obstacle in the way of her nationals volunteering for service in the Italian army. San Marino was represented on the International Radio-telegraphic Congress of Basle (1913) and had a wireless station (receiving only) on Monte Titano but, on the entry of Italy into the war, complications arising with Germany, it was dismantled and in 1920 had not been reinstalled.

SANTAYANA, GEORGE (1863—), American philosopher and writer, was born in Madrid, Spain, Dec. 16 1863. At the age of nine he came to America and was educated at Harvard (A.B. 1886; Ph.D. 1889), where he taught from 1889 to 1912 as instructor, assistant professor, and, after 1907, as professor of philosophy. He then retired to devote his time to literary work. In 1905 he was Hyde Lecturer at the Sorbonne. He was a member of the National Institute of Arts and Letters. His chief work is *The Life of Reason: or the Phases of Human Progress* (1905-6), 5 vols., entitled respectively *Reason in Common Sense; Reason in Society; Reason in Religion; Reason in Art and Reason in Science*. His other writings include: *Sonnets and Other Verses* (1894); *Lucifer, a Theological Tragedy* (1899); *Three Philosophical Poets* (1910); *Winds of Doctrine; Studies in Contemporary Opinion* (1913); *Egotism in German Philosophy* (1916) and *Character and Opinion in the United States; with Reminiscences of William James and Josiah Royce, and Academic Life in America* (1920).

SANTO DOMINGO (see 24.194).—The decade 1910-20 witnessed a succession of abrupt changes in the political status of Santo Domingo, accompanied by corresponding economic and social developments. The civil security and material well-being ushered in by the Dominican-American Convention of 1907 came to an end with the assassination of President Ramon Caceres on Nov. 19 1911. Gen. Alfredo M. Victoria, the dominant military figure, secured the selection of his uncle Eladio Victoria as president. Revolutionary outbreaks of the traditional type followed, culminating in the appointment of a special commission by the President of the United States, to aid in the reestablishment of peace and order. Conferences resulted in the resignation of Victoria and the election of Archbishop Adolfo A. Nouel as provisional President. Friction developed, and on March 31 1913, Monsignor Nouel resigned and embarked for Europe. The Dominican Congress selected as provisional successor, Gen. José Bordas Baldez. Revolutionary disturbances again broke out and the United States once more lent its good offices by sending a commission, with an advisory aid Dr. Ramon Baez was selected as provisional president Aug. 27 1914. Some months later Juan Isidro Jiménez was chosen constitutional president. A brief period of peace and order was interrupted in April 1916 by an outbreak led by

Gen. Desiderio Arias (a chronic revolutionist from Monte Christi), which President Jiménez, aged and infirm, failed to check. Arias seized the military control of the capital, practically deposed Jiménez and assumed the executive power. With another civil war thus imminent, with its patience strained by the events of the preceding years, and with the international situation developed by the World War threatening foreign intervention, the United States now took definite action. Naval forces were landed. President Jiménez resigned the presidency and retired to Porto Rico, and in May-June 1916 the pacification of the country was effected with nothing more serious than minor encounters with revolutionary forces. On July 25 1916, the Dominican Congress selected Dr. Francisco Henriquez Carvajal as temporary president. The United States, refusing recognition until assured of the non-recurrence of civil disorder, proposed a new treaty based upon the convention just adopted between the United States and Haiti (see HAITI), which should repair the shortcomings of the 1907 convention in providing for the collection of customs under American auspices, the appointment of an American financial adviser and the establishment of a constabulary force officered by Americans. President Henriquez refused to enter into this arrangement, with a resultant deadlock intensified by the withholding by the American authorities of the revenues collected by its officers. Matters came to a head with Henriquez's intention not to retire from the presidency upon the expiration of his provisional term but to present himself as a probable successful candidate for popular election. On Nov. 29 1916 by proclamation of the American commander of the forces of occupation, Santo Domingo was placed under the military administration of the United States. Executive departments were taken over by American naval officers, ex-president Henriquez left the country, order was quickly established, and Santo Domingo entered upon four years of civil quiet and economic improvement. The termination of this status was foreshadowed Dec. 24 1920 by a proclamation of the military government that "the time has arrived when it may, with a due sense of its responsibility to the people of the Dominican Republic, inaugurate the simple processes of its rapid withdrawal from the responsibilities assumed in connexion with Dominican affairs." Announcement was made that a commission of representative Dominicans with a technical adviser was to be appointed, entrusted with the formulation of constitutional amendments and the revision of the laws of the republic, such proposals upon approval of the military governor to be submitted to a constitutional convention and to the national congress.

The economic experience of the country in the decade reflected closely the successive political changes outlined above. Agriculture continued the mainstay of the country's life; and cacao, sugar and tobacco leaf remained its staple crops. Increased production in the years following the convention of 1907 showed arrest in 1912-4 changing to abrupt increase in 1915. With the war-induced rise in prices and the conditions born of military occupation, the upward movement in export values continued through 1920, assuming sensational proportions in the last-named year. The combined volume of imports and exports was less in 1914 than in 1911; but the increase in 1915 over 1914 was greater than the total exports in 1905, and the increase in 1916 over 1915 was almost as much as the combined exports and imports of 1905. The combined value of imports and exports was \$105,257,117 in 1920, as compared with \$61,621,019 in 1919 and \$17,945,208, in 1911. An increasing proportion of this trade has been with the United States, 77.17% of imports and 87.03% of exports in 1919, as compared with 59.29 and 52.31% respectively, in 1911. In the first half of the decade political disturbances delayed the course of financial extrication ensured by the convention of 1907; but after 1916 rapid progress was made. On Dec. 31 1920, the sinking fund established for the \$20,000,000 U.S. customs administration loan amounted to \$11,457,373, ensuring amortization long before maturity. A loan of \$1,500,000 authorized by the United States to discharge internal debts contracted in 1911-2 was finally liquidated in 1917. A further issue of \$4,000,000 authorized in 1918 to liquidate and fund all outstanding internal indebtedness, as adjusted by a claims commission appointed by the military government, will be paid off by Dec. 31 1922. Economic and social conditions, although suffering from the political agitation prior to 1916, remained throughout far above the preconvention state. Since the military administration progress was notable. Roads and bridges were built, schools established, public sanitation extended, steps taken to clear up the complicated land title situation, internal taxation made effective and competence and regularity introduced in administrative service. Whether this was achieved at the expense of weakened capacity for

self-government may be doubted. The policy of the United States was to make evident to the best elements in Santo Domingo what honesty and efficiency in administration could accomplish, as well as the futility and cost of "government by revolution."

The military government of Santo Domingo completed in 1921 the first census ever taken of the republic, and reported the number of inhabitants as 897,405. The population is scattered chiefly in a fringe along the shore and in the Cibao Valley especially in the region thereof known as the Royal Plain. In the mountainous interiors are vast uninhabited stretches and valleys which have not been visited since the days of the Conquest.

See Otto Schoenrich, *Santo Domingo: A Country with a Future* (1918); Report of Military Governor on Conditions in Santo Domingo, in *Annual Report of Secretary of the Navy* (1920). (J. H. Ho.)

SARGENT, JOHN SINGER (1856-), Anglo-American artist (see 24,219), exhibited in 1910 the open-air paintings "Albanian Olive Gatherers," "Glacier Streams," "A Garden at Corfu" and "Vespers." In 1911 appeared "A Waterfall" and "The Loggia." His portrait of Henry James was exhibited in 1914, and was one of the pictures damaged in that year by suffragette attacks. He contributed in 1915 a blank canvas to a Red Cross sale at Christie's, which was secured by Sir Hugh Lane just before his death for £10,000. In Dec. 1916 the third series of his mural decorations in the Boston Public Library was unveiled. This concluding series is entitled "The Theme of the Madonna." The first series (1895) depicts "The Judaic Development"; the second (1903), "The Dogma of the Redemption." The theme of the whole is "Judaism and Christianity." In 1917 he was elected a trustee of the Tate Gallery. During the World War he made a number of paintings of scenes on the western front; and his large picture "Gassed" in the Royal Academy in 1919 attracted great attention. In Nov. 1921 his decorations in the rotunda of the Boston Museum of Fine Arts were unveiled.

SARRAIL, MAURICE PAUL EMMANUEL (1856-), French General, was born at Carcassonne (Aude) April 6 1856. He qualified for both St. Cyr, and the École Polytechnique but chose to enter the former. He passed out Oct. 1 1877 with the distinction of third place and was posted as a sub-lieutenant to the infantry. His regimental service and promotion followed the normal course; he became lieutenant Oct. 1882, captain in 1887, and *chef-de-bataillon* in 1897. In 1901 he was appointed Commandant of the École Militaire d'Infanterie (St. Maixent), and the following year was promoted lieutenant-colonel. From 1904 to 1906 he held the appointment of Military Commandant of the Palais Bourbon, being made colonel in 1905. In 1907 he became Director of Infantry at the War Office—an appointment which he held 4 years. He was made general-of-brigade in 1908. Three years later he was promoted general-of-division and on Nov. 1 1913 was given command of the VIII. Army Corps, being later (April 24 1914) transferred to the VI. Corps, which he commanded on the outbreak of the World War. But though General Sarrail's military capacity was recognized prior to 1914 it was principally by his semi-political activities that he was best known; and as a member of General André's military cabinet he played a conspicuous part during a very troubled period of French army history. On Sept. 2 1914, after commanding the VI. Corps with credit in the Battle of the Frontiers, he was appointed to succeed Ruffey as commander of the III. Army. This army formed the pivot of the wheel-back of the Allied forces during the retreat to the Marne, and Sarrail maintained it as such on the N.W. front of Verdun, although authorized and indeed ordered to fall back. This left him in an exposed position, but one in which the swinging-in enemy himself might present a flank to Sarrail's attack. His part in bringing about the situation which enabled Joffre to counter-attack was thus as important and as brilliant as Gallieni's on the other flank. During the trench-warfare operations of 1914-15, however, he was less successful, as he was essentially a leader of temperament, and growing friction with Joffre led to his dismissal from this command after the action of Bourdailles. Almost immediately thereafter, under circumstances described in the article SALONIKA CAMPAIGNS, Sarrail was appointed Commander of the French Army of the East, and at a later date he became commander-in-chief of the Allied forces on that front. The troubled history

of this command, which lasted till his recall in Dec. 1917, is told in the article referred to. After his return to France he saw no further active service. In April 1918 he was placed on the reserve on reaching the age limit. He became a Grand Officer of the Legion of Honour in Nov. 1914 and was awarded a Grand Cross of the same Order in Jan. 1916. He was given the Médaille Militaire in Sept. 1917. Soon after the end of the war he published his account of the Salonika operations under the title *Mon Commandement en Orient*.

SASKATCHEWAN (see 24,225).—This Canadian province includes 243,382 sq. m. of land area and 8,318 sq. m. of water; 251,700 sq. m. in all. Its southern boundary is the 49th parallel and its northern the 60th: it is 390 m. from E. to W. and 760 m. from N. to S. The province comprises portions of the old districts of Assiniboia, Saskatchewan and Athabasca, which formed part of the old North-West Territories, with the town of Regina as the capital and the residence of the lieutenant-governor.

The province may be divided into four more or less well-defined zones. (1) The prairie zone forms the most southerly portion, extending from the U.S. boundary as far N. as the town of Saskatoon, and marked by open rolling prairie country of the richest possible agricultural character. (2) The prairie and woodland zone extends from Saskatoon to the southern edge of the great northern forest, consisting of mixed prairie country and woodland adapted for farming and stock-raising. (3) A dense forest zone is bounded on the S. by a line passing from the Swan river in a N.W. direction near the town of Prince Albert, and on the N. by a line drawn from the northern part of Reindeer lake to the southern part of Lake Athabasca. This zone is well watered and well timbered, being covered with a forest growth of spruce, tamarack, jack pine, poplar and birch. (4) The sparsely wooded forest zone includes the remainder of the country northward.

The geology of Saskatchewan is simple. Formations of very ancient, highly crystalline, contorted and foliated or schistose rocks, together with metamorphic rocks and eruptives, form a floor or basement complex referable to the Laurentian and Huronian systems, and upon this floor of primitive rocks there rests unconformably an uninterrupted succession of evenly bedded and for the most part stratified sedimentary formations ranging from the Keweenaw of supposed Cambrian age, through the paleozoic and mesozoic, to the Tertiary and Quaternary ages inclusive.

The province has an elevation of from 1,500 to 3,000 ft. above sea-level, which accounts for the dryness and clearness of the atmosphere. As in southern Alberta, portions of the country need irrigation, and the requirements of water and the sources of supply are problems being dealt with by the several governments interested.

The following table shows the growth of pop. since 1901:—

	Male	Female	Total
1901	49,431	41,848	91,279
1906	132,791	104,972	237,763
1911	291,730	202,702	494,432
1916	363,787	284,048	647,835

In 1916 the urban and rural pops. were 176,297 and 471,538 respectively. The census showed 150,292 families with an average of 4.31 persons per family housed in 140,359 dwellings. The origins were: Canadian-born 352,920; English 90,435; Irish 62,551; Scotch 64,735; Welsh 1,451; French 24,011; German 34,091; Austro-Hungarian 24,195; Scandinavian 13,064; Dutch 5,448; Indian 10,736; Polish 2,550; Russian 11,623; Ukrainian 2,175; others 8,806. The U.S. immigrants of various nationalities born in the United States were 87,907; of these 46% were British descendants. There is a largish community of Russian Doukhobors. The Indians of Saskatchewan are chiefly plain or wood Crees, with a mixture among them of Saulteaux. Towards the S. small bands of Assiniboines are found, and here and there small companies of refugee Sioux from the United States. They number 10,736 and are all on Government reserves. Steady progress had been made in enabling the Indians to become self-supporting, and to live in comfortable houses, growing crops of grain, making hay and possessing herds of cattle. At the various industrial schools young Indians, both male and female, receive a practical education.

Regina, on the main line of the C.P.R., is the capital, and had in 1920 a pop. estimated at 27,000. It was formerly the headquarters of the Royal Northwest Mounted Police. It contains the provincial legislature buildings, one of the provincial normal schools and the Regina College.

Moose Jaw (estimated pop. in 1920, 17,000) is situated on the main line of the C.P.R. It has extensive stock-yards and flour-mills, also a storage elevator with a capacity of about 3,500,000 bushels.

Prince Albert, on the banks of the North Saskatchewan (pop. in 1920 about 7,000), bids fair to become a manufacturing centre. It contains large sawmills and flour-mills, and is the centre for the fur-trading industry.

Saskatoon (pop. 1920, 22,000) has been one of the rapid urban growths of the Middle West. It is an important railway and distributing centre, through which the C.P.R. and two Canadian National railways pass. Tributary to the town is a large area of arable and prairie land.

North Battleford, Swift Current, Weyburn, Battleford, Maple Creek, Melville, Estevan, Yorkton, Humboldt, Indian Head, Moosomin, Qu'Appelle, Kamsack, Rosthern and Wolseley are local centres, deriving their importance chiefly from their situation in the midst of rich agricultural districts.

The executive Council of Saskatchewan consists of 7 members and the Legislative Assembly of 62 members. The province is represented in the Federal Parliament by 16 members of the House of Commons and 6 senators.

Education, both primary and secondary, receives earnest attention from the Government. The schools are free and supported by the Government and local taxation. Collegiate institutes and high schools are found in every important centre. Normal schools for the training of teachers are maintained at Regina and Saskatoon. The university of Saskatchewan at Saskatoon is supported and controlled by the province. In connexion with it is the agricultural college, which is well equipped for its special purpose and conducts very practical work among the farmers of the province. Saskatchewan schools in 1918 numbered 3,941 and maintained 6,662 teachers. The total enrolment in that year was 147,232, and the entire cost of administration \$9,110,925 (in 1906 it was \$1,465,361).

The province is essentially agricultural. The soil, made up of the detritus or debris of a great variety of rock materials and rich in natural phosphates, is characterized by its ability to produce a high average yield of wheat, oats, barley and potatoes for many years in succession without the application of artificial fertilizers. From experiments carried on at Indian Head—the headquarters of the experimental farm subsidized by the Dominion Government—it has been ascertained that the high average yields of wheat, oats, barley and potatoes on that farm are not only maintained from year to year, but are actually larger than at any of the other Dominion experimental farms scattered throughout Canada.

Saskatchewan has probably the greatest possibilities of production of all the provinces in the Dominion. Of the land area of 243,382 sq. m. a little over 25,000 were under crop in 1918, and it is estimated that, apart from forest land requiring clearing, 112,000 sq. m. are suitable for agriculture. In its southern parts the returns equal those of Manitoba, which have been regarded as exceptional. On the average of 1915-7 the yield was 163,264,100 bus. of wheat at a total value of \$207,590,833. The limited area under cultivation yields a grain crop exceeding 350,000,000 bus. in a single year. The following are yields and values for the year 1920: wheat 113,387,300 bus., value \$175,700,000; oats 141,590,000 bus., value \$58,035,000; barley 10,501,000 bus., value \$6,931,000; rye 2,335,000 bus., value \$3,194,000; mixed grains 615,000 bus., value \$760,000; flax-seed 5,705,000 bus., value \$10,383,000; potatoes 6,861,000 bus., value \$8,576,000; turnips, etc., 3,145,000 bus., value \$2,956,000; hay and clover 328,300 tons, value \$3,283,000.

With the exception of wheat and oats, the field crops are mainly grown for home consumption in stock-raising. The erection of silos in connexion with well-appointed farm buildings indicates the improvement of methods and the growing prosperity of farmers. The cattle industry of Saskatchewan has reached a very important place. There are many large herds scattered throughout the province, subsisting for a large portion of the year on native grasses and for the remainder of the year—the winter months—on outdoor feeding. So rapidly has the cattle industry advanced in the past few years that it has been found necessary to establish large stock-yards at Prince Albert and Moose Jaw. Dairying, naturally associated with the cattle industry, is making rapid progress, and at important points in the province are established up-to-date creameries. The output of dairy and creamery butter for one year amounted to 19,368,668 lbs., valued at \$6,192,213, to which is to be added milk and cream to the value of \$7,450,000, or a total of \$13,642,213. In 1907 there were only four creameries in operation with 213 patrons, and in 1920 there were 20 creameries with 7,500 patrons and in addition four cold-storage plants. The raising of sheep has become general throughout the province, particularly in the northern part, where the conditions are most favourable.

The lumbering district of Saskatchewan lies N. of Prince Albert. Trees consist mainly of spruce, larch, jack pine, white and black poplar and white birch. Much of the timber is used for railway ties,

and the recent annual cut amounted in value to about \$2,000,000 a year. In the northern section of the province the Dominion Government set aside a number of large areas as forest reserves. The forests of the north still abound in fur-bearing animals, the principal being bear, otter, beaver, marten, wolf and mink. Prince Albert and Battleford are local centres of the fur trade, the annual value of which is about \$1,450,000.

Manufacturing industries are not yet important in Saskatchewan. There are a number of flour-mills throughout the province, and the making of cement and bricks is coming more and more into prominence. Coal-mining, however, promises to be the principal industry of the province. Mining has been carried on for several years in the vicinity of Estevan. The lignite deposits of Saskatchewan, which underlie an area of 7,500 sq. m. and are estimated to contain 200,000,000 tons of lignite coal, were in 1920 being experimented with by processes of carbonization and briquetting. Gold, silver, copper, cobalt, iron, mica, peat, pigments, ochres and natural gas are among the mineral resources of the province. The value of minerals raised in 1919 was \$1,118,055. The fisheries of Saskatchewan are still in their infancy. The lakes and rivers of northern and central Saskatchewan abound in fish sufficient to supply millions of people. The value of the fisheries in 1919 was \$475,797.

For more than 30 years up to 1921 the main line of the C.P.R. had crossed the province of Saskatchewan from E. to W., about 100 m. N. of the border of the United States. One of its most important branches is the "Soo" line from Moose Jaw to St. Paul, Minn. Its lines to Edmonton and Lacombe, Alberta, have daily increasing traffic and passenger service. The main lines of the Canadian National railways also cross the province, with many branches tapping its rich agricultural districts. Saskatchewan has now over 6,000 m. of railway. The province is so well served by the C.P.R. and the Canadian National railways, with their numerous branches, that few of the established settlements are more than 10 to 20 m. from a means of transport. The Hudson Bay railway when completed will afford a short haul to ocean shipping from the Saskatchewan grain-fields. The building of roads and bridges within the province has been taken up energetically by the Government, and large sums have been expended. (W. L. G.)

SAVAGE, MINOT JUDSON (1841-1918), American divine and author (see 24.239), died in Boston, Mass., May 22 1918.

SAVINGS MOVEMENT.—The origin and development of what became known in England as the "War Savings Movement" provides the subject-matter of one of the most interesting chapters in the economic history of the World War. In the United States, to which reference is made in a subsequent section, the Savings and Economy movement was no less remarkable.

UNITED KINGDOM

Institutions for the normal encouragement of thrift on the part of the people of the United Kingdom were making steady progress up to the date of the outbreak of the war in 1914. From that date onwards the pace of their advance was materially accelerated. The amount due to depositors in the Post Office Savings Bank increased 28% in the decade 1903-13, while during the five years 1913-8 they increased by 42%. The amount due to depositors in the Trustee Savings Banks increased 3.2% in the decade 1903-13, while during the years 1913-20 it increased by 12.5%. These figures give a general indication of the growth of the savings of the people during the war period, but they do not tell the whole story. In the atmosphere created by the War Savings movement, and in the circumstances which for a time materially improved the financial position of the wage-earning classes, not only did existing savings institutions develop rapidly, but a new national thrift machinery was brought into being and its operations met with remarkable success.

Cost of the World War.—Within six months of the outbreak of hostilities in Aug. 1914, it became evident to those who were more closely in touch with realities that the World War would be a prolonged struggle, in which it would be necessary for the combatant nations to marshal their entire resources of production. Modern warfare was seen to demand not only that there should be a high percentage of the population in the fighting forces, but also large numbers of civilians producing on a huge scale military equipment of the most varied character. The enormous volume of goods and services which had to be requisitioned is best expressed in terms of the national expenditure. The largest amount spent by Great Britain in war in a single year before 1914 was £71,000,000. The Revolutionary and Napoleonic wars cost in the aggregate £831,000,000 spread

self-government may be doubted. The policy of the United States was to make evident to the best elements in Santo Domingo what honesty and efficiency in administration could accomplish, as well as the futility and cost of "government by revolution."

The military government of Santo Domingo completed in 1921 the first census ever taken of the republic, and reported the number of inhabitants as 897,405. The population is scattered chiefly in a fringe along the shore and in the Cibao Valley especially in the region thereof known as the Royal Plain. In the mountainous interiors are vast uninhabited stretches and valleys which have not been visited since the days of the Conquest.

See Otto Schoenrich, *Santo Domingo: A Country with a Future* (1918); Report of Military Governor on Conditions in Santo Domingo, in *Annual Report of Secretary of the Navy* (1920). (J. H. Ho.)

SARGENT, JOHN SINGER (1856-), Anglo-American artist (see 24,219), exhibited in 1910 the open-air paintings "Albanian Olive Gatherers," "Glacier Streams," "A Garden at Corfu" and "Vespers." In 1911 appeared "A Waterfall" and "The Loggia." His portrait of Henry James was exhibited in 1914, and was one of the pictures damaged in that year by suffragette attacks. He contributed in 1915 a blank canvas to a Red Cross sale at Christie's, which was secured by Sir Hugh Lane just before his death for £10,000. In Dec. 1916 the third series of his mural decorations in the Boston Public Library was unveiled. This concluding series is entitled "The Theme of the Madonna." The first series (1895) depicts "The Judaic Development"; the second (1903), "The Dogma of the Redemption." The theme of the whole is "Judaism and Christianity." In 1917 he was elected a trustee of the Tate Gallery. During the World War he made a number of paintings of scenes on the western front; and his large picture "Gassed" in the Royal Academy in 1919 attracted great attention. In Nov. 1921 his decorations in the rotunda of the Boston Museum of Fine Arts were unveiled.

SARRAIL, MAURICE PAUL EMMANUEL (1856-), French General, was born at Carcassonne (Aude) April 6 1856. He qualified for both St. Cyr, and the École Polytechnique but chose to enter the former. He passed out Oct. 1 1877 with the distinction of third place and was posted as a sub-lieutenant to the infantry. His regimental service and promotion followed the normal course; he became lieutenant Oct. 1882, captain in 1887, and *chef-de-bataillon* in 1897. In 1901 he was appointed Commandant of the École Militaire d'Infanterie (St. Maixent), and the following year was promoted lieutenant-colonel. From 1904 to 1906 he held the appointment of Military Commandant of the Palais Bourbon, being made colonel in 1905. In 1907 he became Director of Infantry at the War Office—an appointment which he held 4 years. He was made general-of-brigade in 1908. Three years later he was promoted general-of-division and on Nov. 1 1913 was given command of the VIII. Army Corps, being later (April 24 1914) transferred to the VI. Corps, which he commanded on the outbreak of the World War. But though General Sarrail's military capacity was recognized prior to 1914 it was principally by his semi-political activities that he was best known; and as a member of General André's military cabinet he played a conspicuous part during a very troubled period of French army history. On Sept. 2 1914, after commanding the VI. Corps with credit in the Battle of the Frontiers, he was appointed to succeed Ruffey as commander of the III. Army. This army formed the pivot of the wheel-back of the Allied forces during the retreat to the Marne, and Sarrail maintained it as such on the N.W. front of Verdun, although authorized and indeed ordered to fall back. This left him in an exposed position, but one in which the swinging-in enemy himself might present a flank to Sarrail's attack. His part in bringing about the situation which enabled Joffre to counter-attack was thus as important and as brilliant as Gallieni's on the other flank. During the trench-warfare operations of 1914-15, however, he was less successful, as he was essentially a leader of temperament, and growing friction with Joffre led to his dismissal from this command after the action of Bourdailles. Almost immediately thereafter, under circumstances described in the article SALONIKA CAMPAIGNS, Sarrail was appointed Commander of the French Army of the East, and at a later date he became commander-in-chief of the Allied forces on that front. The troubled history

of this command, which lasted till his recall in Dec. 1917, is told in the article referred to. After his return to France he saw no further active service. In April 1918 he was placed on the reserve on reaching the age limit. He became a Grand Officer of the Legion of Honour in Nov. 1914 and was awarded a Grand Cross of the same Order in Jan. 1916. He was given the Médaille Militaire in Sept. 1917. Soon after the end of the war he published his account of the Salonika operations under the title *Mon Commandement en Orient*.

SASKATCHEWAN (see 24,225).—This Canadian province includes 243,382 sq. m. of land area and 8,318 sq. m. of water; 251,700 sq. m. in all. Its southern boundary is the 49th parallel and its northern the 60th: it is 390 m. from E. to W. and 760 m. from N. to S. The province comprises portions of the old districts of Assiniboia, Saskatchewan and Athabasca, which formed part of the old North-West Territories, with the town of Regina as the capital and the residence of the lieutenant-governor.

The province may be divided into four more or less well-defined zones. (1) The prairie zone forms the most southerly portion, extending from the U.S. boundary as far N. as the town of Saskatoon, and marked by open rolling prairie country of the richest possible agricultural character. (2) The prairie and woodland zone extends from Saskatoon to the southern edge of the great northern forest, consisting of mixed prairie country and woodland adapted for farming and stock-raising. (3) A dense forest zone is bounded on the S. by a line passing from the Swan river in a N.W. direction near the town of Prince Albert, and on the N. by a line drawn from the northern part of Reindeer lake to the southern part of Lake Athabasca. This zone is well watered and well timbered, being covered with a forest growth of spruce, tamarack, jack pine, poplar and birch. (4) The sparsely wooded forest zone includes the remainder of the country northward.

The geology of Saskatchewan is simple. Formations of very ancient, highly crystalline, contorted and foliated or schistose rocks, together with metamorphic rocks and eruptives, form a floor or basement complex referable to the Laurentian and Huronian systems, and upon this floor of primitive rocks there rests unconformably an uninterrupted succession of evenly bedded and for the most part stratified sedimentary formations ranging from the Keweenaw of supposed Cambrian age, through the palaeozoic and mesozoic, to the Tertiary and Quaternary ages inclusive.

The province has an elevation of from 1,500 to 3,000 ft. above sea-level, which accounts for the dryness and clearness of the atmosphere. As in southern Alberta, portions of the country need irrigation, and the requirements of water and the sources of supply are problems being dealt with by the several governments interested.

The following table shows the growth of pop. since 1901:—

	Male	Female	Total
1901	49,431	41,848	91,279
1906	132,791	104,972	237,763
1911	291,730	202,702	494,432
1916	353,787	284,048	647,835

In 1916 the urban and rural pops. were 176,297 and 471,538 respectively. The census showed 150,292 families with an average of 4.31 persons per family housed in 140,359 dwellings. The origins were: Canadian-born 352,920; English 90,435; Irish 62,551; Scotch 64,735; Welsh 1,451; French 24,011; German 34,091; Austro-Hungarian 24,195; Scandinavian 13,064; Dutch 5,448; Indian 10,736; Polish 2,550; Russian 11,623; Ukrainian 2,175; others 8,806. The U.S. immigrants of various nationalities born in the United States were 87,907; of these 46% were British descendants. There is a largish community of Russian Doukhobors. The Indians of Saskatchewan are chiefly plain or wood Crees, with a mixture among them of Saulteaux. Towards the S. small bands of Assiniboines are found, and here and there small companies of refugee Sioux from the United States. They number 10,736 and are all on Government reserves. Steady progress had been made in enabling the Indians to become self-supporting, and to live in comfortable houses, growing crops of grain, making hay and possessing herds of cattle. At the various industrial schools young Indians, both male and female, receive a practical education.

Regina, on the main line of the C.P.R., is the capital, and had in 1920 a pop. estimated at 27,000. It was formerly the headquarters of the Royal Northwest Mounted Police. It contains the provincial legislature buildings, one of the provincial normal schools and the Regina College.

forward statement calling the nation to thrift and urging concentration on the production of essentials only, eschewing non-essentials by universal personal economy.

Montagu Report.—Finally, in Dec. 1915, the Chancellor of the Exchequer (Mr. R. McKenna) set up a Committee under the chairmanship of the financial secretary to the Treasury (Mr. E. S. Montagu) to consider the question of getting contributions to War Loans from the working-classes. The final report of this Committee (Cd. 8179), dated Jan. 26 1916, marked the birth of the War Savings movement as a national organization.

An interim report had been issued on Dec. 28 1915, recommending the removal for the period of the war and six months after of the restrictions which limited the amount deposited by any one depositor in the Post Office and Trustee Savings Banks to £50 in any one year and £200 in all. The Committee also recommended that Exchequer bonds of the denominations of £5, £20 and £50 should be placed on sale at all post-offices, provision being made for the deposit of the bonds at the post-office and the issue of books in which the deposit of the bonds would be recorded. The Chancellor of the Exchequer recommended the adoption of these proposals and they were concurred in by a Treasury minute of the same date. Two series of bonds, with interest at the rate of 5% per annum and 6% per annum respectively, were on sale in 1916 and brought into the Exchequer nearly £44,000,000.

The final report of the Committee pointed out that there were two separate objects to be attained by the successful solution of the problem of the small investor: (a) the reduction of general consumption, which would tend to check the rise in prices; and (b) the raising of a certain amount of money for the prosecution of the war. The needs of the small investor were described as being: (a) a simple method of investing savings; (b) a guarantee that the capital value of the investment will not depreciate; (c) the ability to withdraw savings at short notice; and (d) the knowledge that as high a rate of interest is paid on the money of the small investor as on that of the large. It was further pointed out that both propaganda and organization were essential to success in making any appeal for savings. The report recommended the appointment of two committees—one to carry on propaganda and to establish on a large scale voluntary War Savings associations for coöperative saving, and the second to devise and approve various schemes of saving and to safeguard their financial soundness. In order to meet the needs of the small investor the Committee recommended the issue of a new form of Government security in the shape of "War Savings Deposits" of 15s. 6d. each, each deposit entitling the subscriber to receive £1 on the fifth anniversary of the date of the deposit.

National War Savings Committees.—The Chancellor of the Exchequer adopted the recommendations, and on Feb. 8 1916 the two committees were appointed. (These two committees were amalgamated in the following April under the title of the "National War Savings Committee," separate committees being established for Scotland and Ireland.)

War Savings Certificates.—On Feb. 19 1916, the projected savings deposits were issued under the revised title of "War Savings Certificates." The War Savings certificate must rank as one of the most ingenious and successful financial instruments ever conceived. For the first time in history a security was offered to the people which by its nature tended to concentrate the mind on the growth of capital value through the accumulation of interest, rather than on the annual return in the form of dividends. This feature of the "small investor's Treasury bill," as it has been called, has had, undoubtedly, a far-reaching psychological effect. It may be said to have projected the mind of the investor towards an ultimate personal use of the accumulated proceeds of his investment after a considerable term of years, and to have reduced the motive of investment merely as a means of providing an annual sum to be spent on its arrival. To the intrinsic merits of the certificate the success of the War Savings movement is, to a great extent, attributable. The certificates were purchasable for 15s. 6d. and could be cashed at

any time. At the end of 12 months a certificate could be cashed for 15s. 9d. After this period its cash value increased by a penny a month, and at the end of five years it could be cashed for £1; that is to say, an additional 3d. was added to the value at the end of the fifth year beyond the increase of a penny a month. Subsequently, by Section 4 of the War Loans Act, 1919, the life of the certificates issued, or to be issued, was automatically increased to ten years, the value of the certificates rising after the end of the fifth year by a penny a month until the end of the tenth year, when a further 1s. would be added, making the final encashment value 26s. By the Finance Act, 1918, Section 41, and the War Loans Act, 1919, Section 4, it was provided that the encashment of certificates held by any individual owner could be postponed beyond the period of maturity until the maturity of the last-dated certificate in his possession, such certificates held over increasing in value at a flat rate of a penny a month. Section 42 of the Finance Act, 1916, provided that the accumulated interest payable in respect to any War Savings certificate issued by the Treasury through the Post Office, under which the purchaser by virtue of an immediate payment of 15s. 6d. became entitled after five years to receive the sum of £1, should not be liable to income tax so long as the amount of the certificates held by the purchaser did not exceed the amount for the time being authorized to be held under regulations made by the Treasury. To avoid the serious consequences which would result to the revenue if income taxpayers generally were to use this form of investment, it was originally arranged to confine the issue of War Savings certificates to persons whose total income from all sources did not exceed £300 a year. Experience, however, showed this limitation to be undesirable. The necessity for a declaration as to income at the time of the purchase of the certificates caused administrative difficulties, and by reason of the income limit many wage-earners who were temporarily drawing large wages were unable to buy certificates. In view of these facts, the Committee recommended the Treasury to abolish the income limit, and the restriction was removed on June 10 1916. All formalities in regard to deduction and recovery, proof of exemption or title to abatement from income tax were dispensed with, and a limit of 500 certificates was put on the number allowed to be held by any one person.

By the Finance Act of 1918, it was provided that if a person's holding was brought by inheritance above 500 £1 certificates or their equivalent, the excess might be held without liability to any penalty or to income tax, so long as the person did not purchase for his own benefit, or have purchased for him, any further certificates while holding more than 500 certificates in all.

The War Savings certificate was ingenious not only from the financial standpoint, but also in its form. The certificates were issued in books, upon the cover of which the name of the holder and his address had to be inscribed. The book was of no value except to the person whose name was written upon it. The certificate contained a small panel on its right-hand side, to which the receipt for the purchase price had to be affixed, and the certificate was not valid until this had been done. The receipt was printed on green paper, and each receipt had a number which became the official number of the certificate. The certificate was registered at the money order department of the Post Office as belonging to the particular individual in whose name it was issued. It was necessary to have the signature of the owner to prevent the certificate being cashed by any unauthorized person. In order to provide for this, the receipt which was affixed to the certificate was only the left-hand portion of an original form of receipt, while the right-hand portion, having upon it the corresponding number, had to be filled in by the applicant and handed back to the postmaster. This portion contained the full name and address and signature of the purchaser and formed the basis of the registration system. When the certificate was cashed at a later date, the number on the certificate and the signature of the applicant on the request for repayment could be compared with that portion of the receipt which had been filed. Certificates might be bought by one person on behalf, and in the name of, another person, the signature of the beneficial owner being, if possible, supplied. A cut-out signature from a letter or other document was accepted, but if a signature was not available, it was obtained later by the Post Office. In the case of children under seven years of age the signature was not required. After the receipt had been stuck in the certificate book and a certificate had thus been completed, it could only be transferred to another person in exceptional circumstances and by permission of the Postmaster-

General. A fee of 1s. was charged in respect to each transferee. Certificates were not negotiable, and their value would not be paid to anyone but the holder whose signature was registered by the Post Office. Holders over 16 years of age could make nominations of their holdings in case of death. Every nomination had to be on a proper form, which could be obtained from the Controller of the money order department, and required to be received by the Controller during the lifetime of the holder. In addition to the receipts for the payment for single certificates costing 15s. 6d., each of which was stuck into a certificate book, single documents representing 12 or 25 certificates could be obtained from any money order post-office and most banks. These consisted of two parts divided by a perforation, the left-hand portion for registration, and the right-hand portion to be retained by the purchaser. Books were not supplied for these certificates. Documents were also issued for any number of certificates from 26 to 500, both inclusive. These were not kept at local post-offices, but were issued by the Controller and Accountant General of the Post Office, to whom application with remittance was made direct or through a bank. They were applied for on a special form and issued a day or two after receipt of the application. If a certificate, or book of certificates, were lost, a new certificate, or book of certificates, would be issued at a charge of 1s., provided the serial numbers could be furnished to the Controller of the money order department.

On Dec. 4 1920, the old print of War Savings certificates was withdrawn from sale at post-offices and banks, and on Dec. 6 "National Savings" certificates were substituted. The change was legalized by the Savings Bank Act of 1920, and was one of title only. The conditions attaching to the old certificates still applied.

The savings certificate formed the basis of the operations of the War Savings associations, which were established under the auspices of local War Savings committees and affiliated to the National War Savings Committee.

War Savings Associations.—Not less important than the War Savings certificate was the system of association, or club, proposed by the Montagu Committee. In their final report the Committee pointed out that the would-be investor should not, if it could be avoided, be left to himself to seek for an investment. Facilities for investment should be provided by agencies in close touch with him; and these agencies, having succeeded in inducing him to save, should endeavour by careful propaganda and by thorough organization to persuade him to make the continuance of saving a matter of habit. The Committee emphasized the advantages of placing an agency between the small investor and the State which could collect and manage the savings of the small investor. It was pointed out that the Government could enter into no contractual relationship with the individual investor, unless it assumed complete control over the schemes adopted and also supervised in detail the actual administration of the societies themselves. They added that the organization of such control and supervision would require the creation of a new Government department, which, apart from the question of the expense involved, it would have been impossible to staff during the war. Also, the rigidity of procedure which a State system would inevitably involve would be fatal to the free local initiative on which the success of such a scheme would depend. At the same time, if societies, many of which have at their command no expert financial knowledge, were left free to develop schemes without supervision or control, some of them would not unlikely become insolvent. The problem was to obtain the best safeguards which could be secured for the financial soundness and efficient administration of the different schemes, while leaving the responsibility for both administration and results with the societies themselves, and they recommended that the committee which should be appointed by the Government, and to which the various investment societies might be affiliated, should be regarded, not as representing the Government, but as an independent body of experts acting on behalf of the societies themselves. Its duties would be primarily of an advisory character, but it could properly refuse to recognize any society the constitution and rules of which it did not approve and withdraw recognition from any society which might fail to satisfy the committee that it was being properly administered. The committee could, if it saw fit, organize a system of inspection and audit of the operations and accounts of the affiliated societies and by these means secure a very substantial measure of control over their operations.

Local War Savings Committees.—In accordance with these views, the War Savings Committee embarked upon a widespread scheme for the promotion of savings associations, delegating the propagandist work in a large measure to local committees which were set up throughout the country. Before the war was over there were in existence in England and Wales 60 county committees and 1,840 local war savings committees acting as propagandist agencies under the general control of the central body, while the War Savings associations set up under their auspices numbered over 40,000 with a membership of approximately 4,000,000 people. (At the end of 1920 there were still 1,701 local committees and over 28,000 associations.) A savings association could be formed by any number of people who were willing to work together to secure the attainment of its objects. In practice it was found that an association could readily be formed by those who were already corporate in some way; for example, by those who were members of a trade union, a friendly society or a coöperative society, by fellow workers in a shop or factory, or by the members of a church, chapel or social club. Each association had its governing committee, secretary and treasurer.

Scotland and Ireland, with their separate organizations, developed the movement on similar lines. The total number of voluntary workers in the movement was estimated to be between 200,000 and 250,000.

Official Agents.—By the end of 1917, when nearly 30,000 War Savings associations had been affiliated, there had been established on an average one association for every 1,200 inhabitants in England and Wales. Most of the social and industrial groups were covered, but it was realized that a large section of the wage-earning population and, possibly, the most highly paid, did not readily join War Savings associations. Many employees objected to joining associations to whose books their employers might have access. They were of opinion that knowledge of the fact that they were saving money might tend to diminish the force of any claim they might make for enhanced wages on account of the increased cost of living. With a view to reaching the prospective small investors of this class, it was decided to add to the number of places where War Savings certificates and National War Bonds could be bought. Certificates were on sale at all money order offices and at most banks, but the majority of the class of persons under consideration had no banking account and had no reason to enter a bank. The Post Office staff was obviously unable to make any special effort to push the sale of Government securities, having regard to the heavy mortgage on their time caused by the manifold additional duties which the exigencies of the war period cast upon them. It was therefore arranged to license certain tradesmen and firms as official agents for the sale of certificates and bonds. These agents purchased the securities outright with their own funds and received the certificates and bonds dated, but unregistered. They then resold the certificates and bonds to their customers and others. By the end of the war, these securities were on sale at more than 14,000 shops and other establishments throughout the country. Very large numbers of certificates in the aggregate were sold in this way. The success of the system is noteworthy in that it involved the sacrifice by the official agents of the interest upon the capital used for the purchase of stocks of certificates between the dates of purchase and sale.

Savings Schemes.—The National Committee, following the guidance of the Montagu Committee, had also set itself the task of preparing various model schemes of coöperative saving to meet the requirements of the people. The following schemes were evolved at various times:—

Scheme 1.—Money subscribed through a savings association was invested in Post Office Exchequer bonds. For each £5 Exchequer Bond a subscriber paid 2s. a week for 50 weeks, or 10s. a month for 10 months. All sums subscribed were remitted to the Treasury each week, the Treasury paying interest on the amounts received at the rate of 5% per annum. The bonds and cash payments due to members were distributed half-yearly, e.g. in the case of subscriptions beginning May 1916 bonds and cash were distributed June 1 1917, weekly subscribers receiving a cash payment of 2s., and monthly subscribers 1s. 9d. The cash distributed was free of income tax, but had to be included in the income-tax return of mem-

bers. It could be paid at the Post Office or could be credited to an account in a savings bank. This scheme was not adopted on a wide scale and was abandoned at a later date. Schemes involving subscriptions for certificates were found in practice to be more popular and more easily worked.

Scheme 2A.—Monies subscribed through an association are invested in War Savings certificates. Subscriptions of 6d. or any number of sixpences are accepted. War Savings certificates are purchased from the Post Office with the cash received by the secretary from the members, and they are dated at the time of purchase, but they are not registered. Each member when he pays his first subscription is given a book. His subscriptions are entered in the book as and when they are paid. When the subscription of any member amounts to 15s. 6d., he is given a certificate and the registration portion of the certificate is then filled in and lodged at the Post Office. The method of distributing certificates of different dates and consequently of different encashment values is settled by the committee of each association. Members can withdraw before reaching the full 15s. 6d. and the amount deposited is repaid, but without interest. The advantage of the scheme lies in this, that if 31 people individually save 6d. a week for 31 weeks, they will each have a certificate at the end of 31 weeks, but if they join an association to which they pay 6d. a week, the association is able to buy one certificate each week, and at the end of 31 weeks it will have 31 certificates. The first of these certificates is dated 30 weeks earlier than a certificate bought by any member acting alone. On the average, they will be dated 15 weeks earlier and consequently will mature 15 weeks earlier. The books are provided free of cost by the National Committee. The book-keeping is necessarily somewhat detailed, but it is essential for the protection of members.

This scheme was probably the most widely adopted.

Scheme 2B is similar to Scheme 2A, but the certificates are not distributed until one year after the subscriptions of any member amount to 15s. 6d. The scheme was not widely adopted, people preferring to get their certificates immediately they had made up their 15s. 6d.

Scheme 3 is in essence a savings bank—all the money received being invested in War Savings certificates. The minimum subscription is one penny. Any number of pennies are accepted. Subscriptions are withdrawable at 14 days' notice, or without notice in urgent cases. Each member has a book in which subscriptions are entered. On the completion of the payment of 15s. 6d. the member is registered as being entitled to the payment of £1 at the end of five years. The certificates are not distributed but are held by the association until they mature. A few associations in schools adopted this scheme, but after a time the majority ended by distributing the certificates to their members and adopting Scheme 2A.

Scheme 4 was a scheme for investment by instalments in Exchequer bonds and War Savings certificates, the Treasury paying interest on the amounts received at 5% per annum. During the war no part of the amounts paid into the Treasury were withdrawable in cash. When an Exchequer bond or certificate was fully paid for the Treasury issued the security to the association for delivery to the member entitled to it, the cost of the securities being charged to the amount standing to the credit of the association with the Treasury. Cash was to be returned to the association three months after the end of the war. This scheme was not found satisfactory and was little adopted.

Scheme 5 is a scheme similar in principle to Scheme 2A, but subscriptions are paid by buying from the association sixpenny coupons. The coupons are of a special "Swastika" design and can only be used for subscribing to associations by whom they are issued. The association is supplied on credit with coupons issued by the Central Committee and these have to be accounted for. The association overprints its coupons with its own serial number. Members get a coupon for each 6d. and place the coupon on a card. When the card is full it is exchanged for one of the certificates already purchased by the combined subscriptions of the members. As full cards of coupons come in they are sent to the Central Office in reduction of the association's liability for those supplied on credit. (At a later date the coupons were issued to the associations in the standing imprest system.) This scheme involved little or no ordinary book-keeping. A register of the issue of certificates was kept. The only clerical work involved of necessity was the keeping of a careful stock of the coupons. The scheme was adopted on a large scale and by some of the largest associations. As a general rule, local committees handled the distribution of the coupons in their districts. This threw a heavy burden on the local secretaries. Considerable difficulty was experienced in many instances in clearing coupon stock accounts, and the distribution of coupons on an enormous scale threw a large amount of work on the head office. The scheme was gradually being replaced by a more simple system of cash savings stamps procurable from any post-office.

Scheme 6 is a special scheme under which employers purchase certificates on behalf of employees with their own funds. The certificates are purchased on a book, that is to say, unregistered, and sold to the employees by instalment system preferred by the employer. The effect makes a free grant to his employees of the money between the date of purchase and the date of redemption.

Scheme 7 is a development of an earlier system under which the Post Office issued cards upon which 31 ordinary sixpenny postage stamps could be affixed by anyone. A card when filled with stamps was exchangeable at any money order office for a War Savings certificate. There was no advantage from co-operation. It was merely a simple device to enable people to save the money for a certificate by instalments of 6d. each.

When the Armistice was signed the National Committee gave careful consideration to devise some alternative scheme to avoid the heavy clerical labour entailed in the working of Schemes 2A, 2B, 3 and 5. This labour had been obtainable during the war on a voluntary basis and it is possible that the very labour itself indirectly assisted the movement in its early days in that it gave the officials of associations the knowledge that they were doing something definite for the benefit of the country in wartime. In 1918, the Post Office agreed to the issue of a distinctive adhesive war savings stamp with the Britannia head design. This stamp was placed on sale at all post-offices. Special savings cards containing 31 spaces were issued to savings associations. Treasurers and secretaries of associations provided themselves with stocks of the stamps, which they were authorized to procure as credit stocks, and they issued these to their members for cash. With the cash they purchased more stamps. The cards when filled were exchangeable for certificates at any money order office, and savings stamps purchased at any post-office or through any agency could be used. The scheme possessed considerable elasticity, as it enabled members of one association on transferring their residence to join another association and complete their subscriptions, or they could fill their cards with stamps purchased anywhere and exchange them for certificates anywhere. The disadvantage lay in the absence of the benefit of the early dating of certificates which was given by the other schemes—an advantage which, it was found in practice, was so generally appreciated that the new scheme, in spite of the saving of labour to the officials of associations, was not widely adopted. After considerable thought the scheme was revised and early in 1921 a system was introduced which, while maintaining the simplicity of Scheme 7, also gave the benefit of the early dating of certificates. The pre-dating of certificates is secured by the use of date labels. The date labels (printed in pairs) are supplied by the National Savings Committee to the association officials. Whenever the official purchases Britannia head savings stamps, he can present at the post-office one pair of these date labels for every 31 sixpenny stamps purchased. The post-office official stamps the labels with a date stamp of that day. When a member of the association presents a card filled up with savings stamps all of which have been purchased from the association, the secretary affixes to the certificate which is issued in exchange for the card one of the officially dated date labels—one date label is affixed to the signature portion of the certificate and its fellow or counterpart is fixed on the counterpart of the certificate in the certificate book. This scheme therefore preserves the full benefit of early dating due to co-operative purchase and yet reduces the clerical work of the association official to the smallest compass. The only book which it is thought advisable for the official to keep is a control receipt book for acknowledging receipt of members' completed cards given in exchange for certificates, this serving also as a register of certificates, in case the member loses his certificate book.

The value of savings stamps sold to Nov. 30 1920 was £7,739,000, of which approximately £1,464,000 had been exchanged for savings certificates.

Municipal Savings Banks.—The Municipal Savings Bank (War Loan Investment) Act, 1916, authorized the establishment, subject to certain restrictions, of municipal savings banks in municipal boroughs with populations exceeding 250,000. The only municipality to adopt this Act was Birmingham, where a bank was started at the end of Sept. 1916. The "Birmingham Corporation Act, 1919" extended the powers of the Corporation and authorized it to establish a savings and housing bank.

Navy, Army and Air Services.—Although military savings banks and facilities for saving in the army had existed since 1859, with the recruiting of large numbers of civilians for the new armies it was found that the normal methods of saving were insufficient to attract very large sums of money.

On the issue of the 4½% War Loan in June 1915 it was felt right that due facilities should be afforded the men in the army for making their investments through the Post Office issue of the Loan. Arrangements were accordingly made for any soldier whose pay account was sufficiently in credit to invest by instalments of 5s., 10s., £1 or £5, the amount being debited to his account and transferred to the Post Office through the regimental paymaster. Similar arrangements were made for the navy and the scheme was found to work so smoothly that it was eventually extended to Exchequer bonds and War Savings certificates as they became available, and ultimately for deposits

in the Post Office Savings Bank. The Post Office undertook the safe custody of the War Savings certificates and bonds for the investors. Later in 1916, by arrangement with the War Office, a special officer was entrusted with the work of establishing war savings associations in the army, with very satisfactory results. In 1917, £186,682 was saved through the army associations; in 1918, £3,162,975; in 1919, £1,804,580; and in 1920, over £1,000,000, making a grand total of £6,000,000. In June 1920 the Army Council, finding the savings associations had such a beneficial effect, made an order that all units both at home and abroad should form savings associations, and arrangements were made for command paymasters stationed abroad to hold stocks of certificates. The Air Ministry at the same time issued an order on similar lines. The War Savings movement was also carried into the navy and merchant service, suitable arrangements being made for remittance of monies through the paymasters and pay offices.

Schools.—It would be impossible to give even the briefest summary of the War Savings movement without reference to the work done by the savings associations in the schools of the country. Thanks to the influence of the Board of Education, and, particularly, to the efforts of a number of inspectors of the Board who were lent for service with the National Committee and who acted as the secretaries of the county committees and as local representatives of the Committee in the provinces, but, above all, thanks to the whole-hearted efforts of thousands of schoolmasters and mistresses throughout the country, there was scarcely an elementary school in the United Kingdom without an efficient and vigorous association. Before the war a very large number of schools had their penny banks. No attempt was made to supplant these. With the coöperation of the savings banks in connexion with which these penny banks were operated, arrangements were made to continue the penny bank system with the savings association methods, and often the two systems were carried on in the same school side by side. The old penny bank system as a "short term" saving machinery had a value which it would have been undesirable to destroy, while it naturally led by stages to the "long term" saving by means of the certificate. Most of the schools continued their banks and associations after the Armistice, and in no section of the community is the movement more alive and progressive to-day. It is impossible to say what proportion of the savings of the country stand in the names of the children, but it must amount to many millions sterling and this alone must have an incalculable effect on the future.

Propaganda.—The human machine created by the National Savings Committee was stimulated, from time to time, by every kind of publicity method. Thousands of public meetings were held and lectures given; educational pamphlets and leaflets dealing with the elements of economics were distributed; special campaigns with such stimulating machinery as "tank banks" were inaugurated; a system of commissioners and organizers in touch with headquarters kept closely in touch with the local committees; special organizations dealt with the army and the navy, munition works and other factories. The local authorities rendered invaluable assistance to the local committees by the loan of staff, the provision of office accommodation and in many other ways. The London and provincial press were consistently sympathetic to the movement and gave freely of their space to record its activities and assist its campaigns. During the war the organization was, from time to time, utilized by the Chancellor of the Exchequer to assist in the public issues of War Bonds and War Loans. During these periods invaluable help was given by leading press experts, who, in coöperation with the National War Savings Committee, undertook the control of special publicity campaigns (see WAR LOAN PUBLICITY CAMPAIGNS). These campaigns for the special issues greatly stimulated the small investor. On each occasion of the issue of a great public loan numbers of new associations came into being and the weekly purchases of certificates were very much increased. One of the most significant results of the adoption of these methods of publicity and propaganda was the great extension

of the numbers of individual citizens holding Government securities. Whereas before the war it was estimated that there were some 345,000 holders of Government securities, it is calculated that no less than 17 million people have to-day a holding in some form of State loan; while the aggregate amount subscribed by small investors through the Post Office for War Loans and other Government securities, including savings certificates, was nearly £500,000,000 at the end of 1920.

Withdrawals.—The Montagu Committee laid emphasis on the fact that the small investor wishes to be able to withdraw his savings at short notice without loss of capital. "The financial emergencies of life come upon the working man with startling suddenness. He may be thrown out of employment, or an illness or death in the family may result in an immediate call. He has not the facilities for credit which the wealthy or even the middle classes enjoy and money only obtainable at six or twelve months' notice is of little use to him." There is no doubt that the losses sustained by the working-classes from their investments through the Post Office in Consols and other similar long-dated securities through the automatic fall in capital value due to the rise in the general rate of interest has had in the past an adverse influence on thrift. Hence the arrangements that War Savings certificates should be repayable at a definite value which is never less than the amount invested, and within two or three days of demand, that is to say, allowing time for identification of the registered holder to avoid payment to a wrongful possessor.

An analysis of the withdrawals of savings certificates is interesting. The total number of certificates sold in the United Kingdom from Feb. 16 1916 to the end of Dec. 1920, was 440,076,000 in £1 units, of a total value at 15s. 6d. each of £343,259,000. The total repayments due to withdrawals, including interest, amounted to £61,404,089, of which £3,521,948 8s. 7d. represented interest. The percentage of the value of certificates repaid (excluding interest) to total value of certificates issued was 18·01 per cent. This percentage may be considered satisfactory when one considers the calls upon the small investor and the fact that the current rate of interest on the shares of well-established commercial and industrial concerns since the Armistice has been very attractive. Much money has been withdrawn for housing, as is evidenced by the case of Ilkham Ferrers in Northants, a town of 2,500 people, where no less than 50 men have bought their houses through investments in savings certificates.

Post-Armistice Period.—In 1917 a committee was appointed by the National Committee to consider what facilities for saving should be provided for the small investor after the war. The committee in their report stated that the habit of saving had, as a result of the War Savings movement, been formed by many people of all classes who had not previously acquired it, and that this habit ought not to be allowed to lapse and that the State should continue to encourage saving after the war by continuing to offer special facilities to the small investor. They saw no reason to suppose that the State would at any time be unable to use profitably the money of the small investor. They pointed out that the ordinary borrowing capacity of the State would be severely taxed by the necessity for renewing and, when possible, consolidating the floating debt, and they considered it worthy of serious consideration whether a plan might not be adopted for applying the proceeds of post-war borrowing from the small investor in order to secure funds for public utility services, such as the housing of the working-classes and other projects of social urgency, the funds for which it might be difficult, if not impossible, to raise otherwise for a considerable period. The committee strongly advised the preservation of the savings machinery established during the war and recommended the permanent continuance, subject to modifications, of the War Savings certificate. The continuance of the savings organization was also recommended by the "Committee on Financial Facilities" appointed in 1917. In their report, dated Nov. 21 1918, they said:—

"We are impressed by the enormous potential increase in the number of the small investors. The continuance on the part of the people of this country of the habit of investing their savings constitutes a most important factor in the provision of the capital necessary for the rapid reconversion of trade and industry. It is impossible to over-estimate the value of the work done by the war savings associations throughout the country, in encouraging habits of thrift

* The deposits included £55,109,506 on account of war gratuities to soldiers and sailors.
N.B.—During the year ending Dec. 31 1920, 57,787,499 certificates of a cash value of £44,785,311 were sold, and repayments, including exchange for War Loans, etc. (excluding interest), amounted to £31,829,879.

and economy. Government securities furnish by far the best and safest medium for the investment of small sums of money, and we are glad to notice that steps are to be taken, by means of savings associations, to continue the policy which had proved so successful during the war."

Immediately after the Armistice steps were taken to consolidate the position of the organization and to render permanent the machinery which had been set up during the previous three years. The county committees were disbanded, their work having been delegated to local committees which they had formed in practically every local area in the country. Steps were taken to devise a complete representative system throughout the organization. Adopting the association, or savings club, as the fundamental unit of the movement, steps were taken to ensure representation of the associations on the local committees. The local committees in their turn elected representatives on a new body called "The National Savings Assembly," which was to meet twice a year to discuss questions relative to the movement and at one of these meetings to elect representatives on the National Savings Committee, which, by the authority of the Government, dropped the word "war" out of its title. At the same time the personnel of the National Committee was considerably strengthened. In 1921 it formed a powerful body composed of representatives of Government departments and corporations and interests connected with thrift, together with representatives of the savings organizations in London and the provinces elected on a wide franchise, so that its continued influence could not fail to be beneficial to the community.

Savings and Local Government Finance.—In the summer of 1920 a step was taken which might well have far-reaching effects on the relations between local and Imperial finance.

The Finance Act 1920, Section 50, provided that 50% of the proceeds of the sales of savings certificates could be invested through the National Debt commissioners in local loans stock or bonds on the security of the local loans fund. Half the proceeds of the gross sales after Oct. 1 1920, in the area of each local authority, would be available, if required, for loans to meet authorized expenditure in connexion with the assisted housing scheme of that authority. These loans were to be made, irrespective of the ratable value of the local authority, by the Public Works Loan commissioners, on the terms in force for the time being for ordinary loans to local authorities from the local loans fund for subsidized housing schemes. In the first instance, such loans would be restricted to housing purposes, but it was hoped that, when the existing difficulties with regard to housing finance had been overcome, the scheme would be given a more general application and that the system would become a permanent feature of local finance, bringing to the aid of local authorities a new source of capital which many of them had long been seeking. The authorities derive the greater part of

the benefit under the scheme, since, although they receive only half the proceeds of the certificates sold, they are not responsible for finding any of the money required to meet withdrawals.

A critic of the ordinary savings bank in the last century said: "The savings bank is after all only a slot in the wall, with a sure grasp, but no tongue to advise it. Having no fructifying use for the money that comes to it from productive employment it closes over it like a grave and effectually sterilizes it"; and Sir E. Brabrook, Chief Registrar of Friendly Societies in 1897, said he "could look upon ordinary savings banks merely as infantile efforts in thrift." He regarded "a person who deposited his money in a savings bank so that it should be kept safe for him by someone else as very much less worthy of encouragement than a person who used his savings in some way in coöperation with other people for his own benefit or the benefit of others." He "did not look upon the progress of the savings bank with unalloyed satisfaction, but only as one step to self-help."

The system of linking up National Savings certificates with local finance becomes, in effect, a national credit bank spread over the whole country. The credits of the small investor, even the half-pennies and pennies saved by the school-children, are rendered, through the machinery of the savings certificates, the Post Office, the National Debt commissioners, the Treasury, the local loans fund and the local authorities, available for investment in social and beneficial enterprise for the good of the people themselves. Owing to the widespread area from which the money is raised, short-term borrowing can be used for long-term loans with the minimum of risk, while saving is stimulated amongst the very class to whom in the past it has been most difficult to teach economy and saving. The linking-up of "saving" with the definite use of the money saved continues effectually the teaching of the war and inculcates the lessons of economy, and goes far to meet Sir E. Brabrook's criticism of the savings bank. The system is certain to stimulate the interest of the small investors in local finance generally. Not only will this be a source of financial strength to the local authorities, but educationally it will be a great advantage, and the active coöperation of the local authorities and the savings committee should do much to stimulate habits of thrift and saving.

OTHER COUNTRIES

The American savings movement is dealt with later. As regards other countries in the war it may be noted that the British National Committee had its organization in the East for the sale of War Savings certificates, the China and Japan War Savings Association having nine centres in China and three in Japan. The Japanese Government itself during the war sent its representatives to inquire into the methods of the National Savings Committee, and established its own system of National Savings certificates with terms of three, five and ten years.

In Canada, war savings and thrift stamps were issued by the Canadian Government.

The Government of S. Africa after the Armistice placed "Union Loan Certificates" on sale at every post-office where savings bank or money order business is transacted. The S. African scheme closely resembled the British savings scheme. Cards were issued with spaces for 15 one-shilling stamps. The cards were issued at an initial price of sixpence. When the card was completed, it could be exchanged for a 15s. 6d. certificate which is worth £1 in five years. The maximum purchasing limit is £387. 10s. 0d. for 500 certificates. The S. African Government also adopted the scheme of associations in savings clubs on the British model.

STATISTICS.—In the preceding tables statistics are given of the results of the work done under the National Savings Committee. (T. G. CH.)

UNITED STATES

Upon the declaration of war by the United States in April 1917 it became evident that the nation must practise strict economy if the huge war-time expenditures were to be successfully financed and material aid given to the Allies. Not merely in money, but in consumption (which means money), the resulting movement for economy among the American people was vigorously taken up. As a first step toward conservation, President Wilson on May 19 1917 outlined a food control programme and appointed Herbert Hoover Food Administrator, and Congress passed the law commonly known as the Lever Act, effective Aug. 10 1917—"an Act to provide further for the national security and defence, by encouraging the production and conservation of supply and controlling the distribution of food products and fuel." The administration of the Act was under the direction of a U.S. Food Administrator and a U.S. Fuel Administrator. The Food Administration summed up its purpose in the motto: "Food will win the war." The following specific ends were sought: (1) to save food and eliminate waste; (2) to distribute food equitably and cheaply; (3) to stimulate production; (4) to prevent hoarding; (5) to save transportation; (6) to provide for the needs of the U.S. army and navy; (7) to secure the largest possible amount of food for the Allies.

The most vital early need both for America and for the Allies was the conservation of sugar and wheat. The shipping shortage was so acute that it was impossible to procure the large surplus of raw sugar in Java, amounting to nearly 1,000,000 tons. Exports of sugar from the United States for the year 1917 were more than 17 times the average for the three years preceding the war. In Aug. 1917 the cost of spot sugar reached \$9.15 per cwt. seaboard basis, and the demand was still unfulfilled. During this month an International Sugar Committee was appointed. Under the operation of this committee the price of Cuban raw sugar declined to \$6.90 by Sept. 14, which was the fixed maximum for the season's crop. The prices to the consumer were maintained at from 8½ cents to 10 cents per lb., varying with the location. As the difference of one cent per lb. added to the price of sugar meant an added burden on American homes of \$72,000,000, the importance of the sugar regulations is evident. As the needs of the United States and of the Allies became more acute, the Licence System governing dealers in food supplies was put into effect and various regulations adopted which governed the producer and consumer alike. In order to control the sugar situation it was announced on May 2 1918 that on and after May 15 sugar should not be sold for manufacturing purposes either by refiners, wholesalers or retailers, except upon the presentation and cancellation of certificates issued by a State Federal Food Administrator, showing the quantity of sugar sold. Retailers were restricted from selling sugar to consumers in quantities greater than 2 lb. for city residents and 5 lb. for those residing in the country, except for home canning, in which cases the dealer was required to secure certificates for the amount sold. By the operation of this system and the voluntary restriction of household consumption, a saving of between 400,000 and 600,000 tons was effected in 1918.

The most serious crisis faced by the Food Administration during its operations was the wheat shortage of the season 1917-8. In the United States the crop, following the exceedingly short harvest of the previous year, was only sufficient to meet normal demands for home consumption. France and England, which together normally produce about one-half the wheat they consume, both suffered very great crop losses, and their total production was considerably less than one-third their normal consumption. In Jan. 1918 an official communication was received from Great Britain stating that, unless America could send the Allies at least 75,000,000 bus. of wheat over and above what they had exported up to Jan. 1, there was grave fear that the war would be lost because of the lack of food. The United States Food Administration replied to this advice: "We will export every grain that the American people save from their normal consumption. We believe our people will not fail to meet the emergency." All manufacturers in the United States using wheat flour in the production of various foods were placed under licence,

and either strictly limited in their use of wheat to a definite percentage of their normal requirements or were denied the use of wheat entirely. Wheatless days and other measures for wheat conservation were established. Mills were permitted to grind only a certain percentage of the amount of wheat milled during a corresponding period the previous year. Wholesale dealers were prohibited from purchasing wheat flour in excess of 70% of the amount they had purchased during a corresponding period of the previous year. In sales to consumers the retailers were required to sell an equal quantity of substitutes to the purchaser at the time wheat flour was sold. The pledge-card campaign was started in Oct. 1917, and between 13,000,000 and 14,000,000 women registered in support of food conservation by substitution. Between Oct. 1 1917 and Aug. 1 1918 hotels, restaurants, dining cars and clubs of the country effected a saving of more than 50,000,000 lb. of flour and wheat products. Flour-mills were required to raise their percentage of extraction to 74% and to eliminate altogether the sale of patent flours. This resulted in a saving of 13,504,300 bus. of wheat. Bakers were required to use a certain percentage of substitute flour in all breads, and this resulted in the saving of 16,830,000 bus. of wheat. These various measures made it possible for the United States to send abroad in 1918 approximately 140,000,000 bus. of wheat.

The importance of fats and oils in the diet of a people caused the Food Administration to lay stress on the conservation of meat products. Export of fats to neutrals was greatly restricted and the amount of fats used in bakery products limited. In 1918 1,125,397 short tons of hog products were exported as against 839,000 in the fiscal year ending June 30 1899, the largest in any previous year. In March 1918 exports averaged 10,000,000 lb. a day. Normally the United States exports yearly a little over 10% of its total pork production. In 1918, under the pressure of war needs, nearly 20% of a much larger production was exported. In 1918 773,000,000 lb. of beef were exported, or over three and a half times the exports on the average of the three war years. These supplies were made available by the conservation of meats formerly wasted, by volunteer rationing and by the adoption in many localities of meatless days and meatless meals.

As the demand on transportation facilities became increasingly heavy, it was vital to keep the routes by which food passed from the producer to the consumer as active as possible. The tremendous increase in the exportation of food and munitions, coupled with the shortage of ocean tonnage, congested eastern terminals. To remedy this condition, a regulation was promulgated providing an average increase in the minimum car-loads of about 50% over those of the published tariffs of the carriers. Thus the number of cars required for the distribution of the commodities on the list of non-perishable groceries was reduced fully 25%. Much material formerly wasted was salvaged by the Waste Reclamation Service, organized originally under the War Industries Board and later transferred to the Department of Commerce. One million five hundred thousand tons of book and writing material were made in 1918 from old paper. The total value of all waste material reclaimed during 1918 was approximately \$1,500,000,000. In monthly reports as to garbage utilization during 1918 it was shown that the redemption plants reclaimed more than 50,000,000 lb. of garbage grease and 160,000 tons of fertilizer tankage from garbage.

Several conservation projects were developed in conjunction with food conservation. The National Emergency Food Garden Corporation put 1,500,000 ac. of city and town land under cultivation in 3,000,000 gardens, resulting in an increase of the food supply to the value of over \$350,000,000 in one year. The School Garden Army, 6,000,000 strong, raised and preserved fruits and vegetables and also aided in the utilization of waste products. Community canning kitchens were widely conducted. The Women's Land Army had during the summer of 1918 units in 20 different states, showing an enrolment of 10,000 in camps and 5,000 in emergency units. They were engaged in fruit packing, dairy work, truck gardening and general farming. Cash-and-carry plans were encouraged and the limitation of deliveries to one a day to any family or on any one route was recommended.

The U.S. Fuel Administration began its work in Aug. 1917, with Dr. Harry A. Garfield as director. The Administration set out to accomplish: (1) increased production; (2) better distribution; (3) fair sale prices; (4) the elimination of waste. Small production was largely due to strikes. The Fuel Administration succeeded in getting employers and employees into agreement and eliminated much of this difficulty. In April 1918 a nation-wide plan designed to insure equitable distribution of coal was put into effect. An essential feature was the zoning system, by which more than 5,000,000 tons formerly shipped from eastern mines to western territory adjacent to western mines was saved for the eastern states where the demand of war industries was greatest. All the price-fixing was done by territory. Inspectors visited each one of the 250,000 industrial plants in the United States using large amounts of coal and worked out with the management systems of conservation. In one week 50,000 tons of coal were thus saved in Pittsburgh alone. Rationing was put into effect, the supply of coal to non-essential industries being greatly reduced. It was estimated that this saved over 1,000,000 tons. All industries were held to their minimum needs. Stores and office buildings were encouraged to take their electric current

from central plants. The "skip-stop" system on electric street railways by which no stops were made at unimportant crossings resulted in a great saving. Economy was also effected by lightless nights, which affected window lighting, electric display and street illumination. Home instruction was given in the operation of heating systems and in the use of electricity. For several weeks heatless Mondays were observed in stores, office buildings and places of amusement. A saving of 12,700,000 tons of coal for the first half of the coal year was thus effected.

On March 19 1918 the President approved the legislation entitled "An Act to save daylight, and to provide standard time for the United States." The purpose of this legislation was to conserve daylight and the Act is commonly known as the "Daylight-Saving Law." It provided for setting the clocks of the nation ahead one hour at two o'clock on the morning of the last Sunday in March of each year and for retarding them by one hour at the same time on the last Sunday in Oct. of each year. By the same piece of legislation the United States was divided into five standard zones. After the repeal of this Act in Aug. 1919, several of the states enacted daylight-saving laws. The operation of the daylight-saving plan caused the saving in seven months of approximately 1,250,000 tons of coal.

Gasoline-less Sundays were inaugurated in Aug. 1918. A cessation of Sunday motoring from 75% to 99% was effected. This resulted in an estimated saving of 1,000,000 bar. of gasoline, from which it is known that 500,000, or 10 shiploads, were sent overseas. The order governing the use of gasoline was withdrawn on Oct. 20 1918.

Under the provisions of "An Act to authorize the President to increase the military establishment of the United States," approved May 18 1917, and later amended, the President was authorized to raise and maintain military forces by selective draft "under such regulations as the President may prescribe not inconsistent with the terms of this Act." Under this law certain exemptions were made removing the liability to military service from those whose industrial occupations were deemed essential to the proper prosecution of the war. Along similar lines several of the states passed like enactments, commonly termed "Work or Fight laws," by which those who had been exempted from military service were forced to accept employment in essential industries or else join the military or naval service and thus conserve the man-power of the nation. Non-essential occupations were listed and because of the simultaneous enactment of a drastic law against loafing in the state of New York the New York City Federal Employment Service was overrun with applications. Over 6,000 were registered July 1, and the next day after the order had been given publicity one bureau registered over 10,000. The majority were from the non-essential occupations, together with a small percentage of the idle or vagrant classes.

The Conservation Division of the War Industries Board was established May 9 1918. Its purpose was to eliminate wasteful or unessential uses of labour, material, equipment and capital. Its specific aim was: (1) to secure the maximum reduction in the number of styles, varieties, sizes, colours or finish of products of the various industries; (2) to eliminate accessories which used material for adornment or convenience, but which were not essential; (3) to substitute materials which were plentiful for those which were scarce; (4) standardization; (5) reduction of waste; (6) economy in samples; (7) economy in containers and packing. The length and swing of men's sack coats and overcoats and the width of facing were limited, the size of samples reduced and each manufacturer restricted to not more than 10 models of sack suits for the season. This resulted in a saving of from 12 to 15% of material. A saving of 33% of wool used in the knitting of sweaters was effected by the reduction in styles and colours. For example, only one shade of green was used where formerly there were many. Manufacturers of shoes were restricted to white, black and tan; wasteful features were eliminated and height limited. As a result one tanner reduced his line from 81 colours and shades to 3, and manufacturers in general reduced their line by about two-thirds. A schedule issued Sept. 13 1918 to manufacturers of rubber footwear provided for the elimination of 5,500 styles, with an estimated annual saving of 29,012,600 cartons, 5,245,300 sq. ft. of shipping and storage space, 2,250,272 lb. of material to be dyed, 74,750 lb. of starch, 30,380 gal. of varnish, 125,300 lb. of tissue paper and 49,617 days of labour.

In addition to the efforts of the War Industries Board there were numerous appeals by Government officials and patriotic organizations to conserve clothing and shoes. As a result a very great proportion of the people wore garments which in normal times would have been discarded. Patching and remaking of clothing became popular practices. Although it is impossible to estimate the saving effected, it is undoubtedly true that many millions of dollars, which would ordinarily have gone for the purchase of wearing apparel, were used to purchase Liberty Bonds and to aid various war philanthropies.

The Pulp and Paper Section of the War Industries Board was organized June 6 1918 to restrict the use of paper and its products and thus to save fuel, transportation and labour. On July 5 1918 the following preliminary economies were requested of all newspapers publishing daily and weekly editions: that they (1) discontinue acceptance of the return of unsold copies; (2) discontinue the use of all samples and complimentary copies; (3) discontinue giving copies to anybody except for office working copies or where required by statute law in the case of office advertising; (4) discontinue giving

free copies to advertisers except not more than one copy each for checking purposes; (5) discontinue arbitrary forcing of copies on news-dealers; (6) discontinue the buying back of papers at either wholesale or retail; (7) discontinue payment of salaries or commissions to agents, dealers or newsboys for the purpose of securing equivalent of return privileges; (8) discontinue all free exchanges. On Sept. 20 the following additional regulations went out: no publisher shall sell his paper at retail less than his published price; no publisher shall use premium contests or similar means to stimulate his circulation; no publisher shall issue holiday, industrial or Sunday special numbers. These regulations brought about a saving in paper during Sept. of 10.4% of the average monthly tonnage during the six months preceding and in Oct. of 5%. There was produced in Sept. 1918 104,209 tons and in Oct. 110,498 tons. All regulations relative to paper were withdrawn on Dec. 15 1918.

The universal response by the people of the United States to the request that they lend money to the Government to provide necessary funds for the prosecution of the war was one of the most significant things of the war period. Millions of people purchased Liberty Bonds and Victory Notes in various denominations from \$50 to \$10,000 (see LIBERTY LOAN PUBLICITY CAMPAIGNS), and other millions invested in the smaller War Savings securities. Early in the war President Wilson made the statement: "I doubt that many good by-products can come out of a war, but if our people learn from this war to save, then the war is worth all it has cost us in money and material." This statement, together with the desirability of having the entire nation participate in financing the war, suggested the underlying purpose behind the war savings movement, which was put into operation in Dec. 1917. Section 6 of the Second Liberty Bond Act, approved Sept. 24 1917, authorized the Secretary of the Treasury "to borrow from time to time on the credit of the United States for the purpose of this Act and to meet public expenditures authorized by law, such sums as in his judgment may be necessary and to issue therefor at such price or prices and upon such terms and conditions as he may determine War Savings Certificates of the United States on which interest to maturity may be discounted in advance at such rate or rates and computed in such manner as he may prescribe." The Act further provided that "each War Savings Certificate so issued shall be payable at such time, not exceeding five years from the date of its issue, and may be redeemable before maturity, upon such terms and conditions as the Secretary of the Treasury may prescribe." A limitation of \$2,000,000,000 was placed by the Act upon the amount of War Savings Certificates which might be outstanding at any one time; it also provided that no person should be sold at any one time certificates amounting to more than \$100, and it also placed a \$1,000 limitation upon the amount of certificates which might be held by any one person. The original Act was amended by the Act approved Sept. 24 1918, which increased the amount of certificates which might be issued from \$2,000,000,000 to \$4,000,000,000, removed the \$100 limitation on the amount of certificates which might be sold to any one person at any one time, and also altered the previous Act by allowing persons to hold an amount not to exceed \$1,000 worth of any series of certificates.

Pursuant to the authorization contained in the original Act, the Secretary of the Treasury appointed a committee of five, with Frank A. Vanderlip as chairman, to confer with him as to the form of security and the terms on which it should be issued. Following the recommendation of this committee, the Secretary of the Treasury offered for sale on Dec. 3 1917 an issue of War Savings Certificate Stamps, Series of 1918. Each certificate stamp when affixed to a War Savings Certificate (a folder with spaces for 20 stamps) would have a fixed maturity value of \$5, with the date of maturity not to exceed five years, the purchase price to vary one cent each month throughout the year of issue, beginning in Jan. at \$4.12, increasing to \$4.23 in December. The stamps might be redeemed before maturity, their redemption value increasing one cent each month. There were also provided 25-cent Thrift Stamps, bearing no interest and not redeemable for cash, but to be accumulated on a Thrift Card until there were 16, when they could be exchanged for a War Savings Certificate Stamp by paying the additional odd cents necessary to cover the current price of the War Savings Cer-

tificate Stamp. Succeeding issues of War Savings Certificate Stamps were on Jan. 1 1919, Jan. 1 1920 and Jan. 1 1921.

In addition to the original securities there were offered in July 1919 Treasury Savings Certificates, one of \$100 and the other \$1,000 maturity value. Treasury Savings Certificates were registered at the Treasury Department at the time of purchase and increased in redemption value monthly on the same interest basis as War Savings Certificate Stamps. In Jan. 1921 there were offered for sale \$1 non-interest-bearing Treasury Savings Stamps and \$25 Treasury Savings Certificates, in addition to the other Treasury Savings Securities.

Following the working out of the types of securities in 1917, an organization for their sale was effected. In addition to the National War Savings Committee, consisting of the chairman and four members, the Secretary of the Treasury appointed six Federal directors, each having general supervision over approximately two Federal Reserve Districts; and 52 state directors, each of whom had complete charge of War Savings activities in his state or part thereof. The National War Savings Committee and the six Federal directors functioned at the National War Savings Committee headquarters in Washington. It was the duty of this sales organization to obtain coöperation from the heads of all enterprises operating nationally and then to decentralize the work through the Federal directors to the respective state directors coming under their jurisdiction, the ultimate goal being to offer every man, woman and child in the United States the privilege of aiding the Government by investing in Government securities, and at the same time to develop habits of thrift. The War Savings securities were put on sale at every post-office, at banks and in thousands of voluntary agencies. House-to-house canvass for their sale was made by postmen, boy scouts, representatives of insurance companies and members of women's organizations. In the autumn of 1918 the Treasury Department created a Savings Division of the War Loan Organization, which took over the work previously carried on by the National War Savings Committee, so that the people of the country might be taught for their peace-time value the lessons of thrift and saving learned during the war. The specific ends sought were: (1) to develop and protect all war issues of Government securities; (2) to sell Treasury Savings securities; (3) to make permanent the habits of regular saving and investment in U.S. Government securities. The Savings Division was placed in charge of a Director of Savings, with an organization in Washington, and one in each of the 12 Federal Reserve Districts.

School Government Savings systems were established. Instruction in thrift, saving and the principles of sound finance was introduced in schools throughout the nation. At the annual convention of the National Education Association in July 1920 a committee of state superintendents was appointed to work out with the Savings Division the best plans for placing the savings movement permanently in the American school system. The American Federation of Labor and various labour bodies passed resolutions commending the work of the Savings Division and calling on the Government to make permanent the policy of issuing small securities. Many local labour organizations invested their reserve funds in Government securities. In industrial plants throughout the country Government Savings Associations were established and the employees put aside small amounts regularly each week in Government Savings securities. Women's organizations of the country during the years 1919 and 1920 created the office of thrift chairman in their boards of officials. They took up the study of finance at club meetings, promoted the use of the household budget and with the savings thus effected purchased Government securities.

The total sale of War Savings securities from Dec. 3 1917 to Jan. 1 1921 amounted in round figures to \$1,176,111,000. The total redemption of War Savings securities for the same period amounted to \$415,174,000. (W. M. LE.)

SAXONY (see 24.265).—The pop. of the Territory and Free State of Saxony, according to the census of 1919, was 4,663,298; in 1910 it was 4,806,661.

During the last few years before the World War political life in the German kingdom of Saxony was dominated by a conflict about the constitution. The parties of the Left had for years demanded a reform of the First Chamber, the Upper House, by which the predominance of the Agrarians in that House should be broken, and commerce, industry, and handicrafts should obtain greater influence. In Jan. 1910 the National Liberals, the Liberals (*Freisinnige*) and the Social Democrats once more introduced resolutions with this object in the Second Chamber, the Lower House, but these proposals met with the keenest opposition from Government, which shared the opinions of the Right. Notwithstanding the majority in the Lower House for the Reform, it was defeated by the refusal of the Upper House to accept it. It was only in Dec. 1917, that the Government introduced a bill for the reform of the Upper House, which again led to fierce conflicts between the Right and Left parties in Parliament, but the advent of the Revolution put an end to these conflicts. Simultaneously controversy concerning a new Electoral Law for the Lower House had constantly been going on since 1910. In Nov. 1911 a Social Democrat was for the first time elected Vice-President of the Diet. With the outbreak of war these questions fell into the background. In the educational sphere the reform of the National Schools System, which was especially advocated by the teaching profession in Saxony, aroused sharp conflicts of opinion among almost all classes of the people. The teachers were fighting for a development of the school system on lines of greater liberty and particularly desired that religious instruction should be regarded in a more liberal light. In 1912 the Government introduced a bill, which did not fully meet the wishes of the school teachers. After some elaborate debates in the Lower House, which produced great excitement throughout Saxony, the bill was rejected in Dec. 1912.

On Nov. 30 1910, Dr. von Rüger, who had been Minister of Finance for many years and at the same time had presided over the Ministry, retired, his successor as Finance Minister being von Seydewitz, while the minister of Justice, von Otto, took over the presidency of the Ministry and was in turn succeeded by the Minister of War, Freiherr von Hausen, in Sept. 1912, who on May 21 1914 gave place to von Carlowitz. The latter resigned his office to Lt.-Gen. von Wilsdorf on Oct. 27 1915 on taking a command in the field.

The year 1913 saw the opening in June of an airship base at Leipzig, the largest in Germany at that date.

On Oct. 18 1913 the unveiling of the monument commemorating the *Völkerschlacht* (the great victory of the continental Allies over Napoleon Oct. 16-18 1813) took place in Leipzig, a celebration at which the Emperor William II. and all the German sovereigns were present. After the ceremony the foundation stone of the German Library was laid, an institution which has since been completed and put in working order. All German publishers have undertaken to place a free copy of every work published by them at the disposal of this library, so that it already possesses more than a hundred thousand volumes. On July 29 1916 the Technical School of Mining at Freiberg, the oldest institution of its kind in Germany, celebrated the hundred and fiftieth anniversary of its foundation.

Saxony, which is chiefly an industrial country and cannot boast of much agriculture, suffered more under war conditions than most other German states. As a country which had been hitherto provisioned from outside, it found the problem of supplying food to its population extremely difficult. There was in many places a real dearth in the most important foodstuffs, such as corn and potatoes, so that the population was frequently obliged to have recourse to substitutes (*Ersatzmittel*).

Shortly before the outbreak of war, during the week July 17-24 1914, King Friedrich August of Saxony was on a visit to the Russian court at Petrograd; then on Aug. 2 the King's warlike appeal to the civilian and military population was published. At the beginning of the war the Saxon troops suffered heavy losses during their advance into the north of France. Already in 1917 the extreme Left in the Saxon Diet had begun an agitation, which never abated, for the early conclusion of peace; this demand led to violent debates between the Left and the Government, the latter being supported by the parties of the Right. On Oct. 26 1918 the Cabinet was forced to resign and to give place to a new Government of a more Liberal colour under Dr. Heinze. On Nov. 9 1918 the revolution broke out, and King Friedrich August abdicated on Nov. 13. A Cabinet of Commissaries of the People (*Volksbeauftragte*) was formed and was entirely composed of members of the extremist section of the Social Democrats, the Independent Socialists. The revolutionary conflicts of Jan. 1919, which entailed sanguinary street fighting in Leipzig, Dresden and other Saxon cities, led to the resignation of the Cabinet, which was succeeded by a Government of the right wing of the Social Democratic party. The extreme Left instituted demonstrations against this Government through-

from central plants. The "skip-stop" system on electric street railways by which no stops were made at unimportant crossings resulted in a great saving. Economy was also effected by lightless nights, which affected window lighting, electric display and street illumination. Home instruction was given in the operation of heating systems and in the use of electricity. For several weeks heatless Mondays were observed in stores, office buildings and places of amusement. A saving of 12,700,000 tons of coal for the first half of the coal year was thus effected.

On March 19 1918 the President approved the legislation entitled "An Act to save daylight, and to provide standard time for the United States." The purpose of this legislation was to conserve daylight and the Act is commonly known as the "Daylight-Saving Law." It provided for setting the clocks of the nation ahead one hour at two o'clock on the morning of the last Sunday in March of each year and for retarding them by one hour at the same time on the last Sunday in Oct. of each year. By the same piece of legislation the United States was divided into five standard zones. After the repeal of this Act in Aug. 1919, several of the states enacted daylight-saving laws. The operation of the daylight-saving plan caused the saving in seven months of approximately 1,250,000 tons of coal.

Gasoline-less Sundays were inaugurated in Aug. 1918. A cessation of Sunday motoring from 75% to 99% was effected. This resulted in an estimated saving of 1,000,000 bar. of gasoline, from which it is known that 500,000, or 10 shiploads, were sent overseas. The order governing the use of gasoline was withdrawn on Oct. 20 1918.

Under the provisions of "An Act to authorize the President to increase the military establishment of the United States," approved May 18 1917, and later amended, the President was authorized to raise and maintain military forces by selective draft "under such regulations as the President may prescribe not inconsistent with the terms of this Act." Under this law certain exemptions were made removing the liability to military service from those whose industrial occupations were deemed essential to the proper prosecution of the war. Along similar lines several of the states passed like enactments, commonly termed "Work or Fight laws," by which those who had been exempted from military service were forced to accept employment in essential industries or else join the military or naval service and thus conserve the man-power of the nation. Non-essential occupations were listed and because of the simultaneous enactment of a drastic law against loafing in the state of New York the New York City Federal Employment Service was overrun with applications. Over 6,000 were registered July 1, and the next day after the order had been given publicity one bureau registered over 10,000. The majority were from the non-essential occupations, together with a small percentage of the idle or vagrant classes.

The Conservation Division of the War Industries Board was established May 9 1918. Its purpose was to eliminate wasteful or unessential uses of labour, material, equipment and capital. Its specific aim was: (1) to secure the maximum reduction in the number of styles, varieties, sizes, colours or finish of products of the various industries; (2) to eliminate accessories which used material for adornment or convenience, but which were not essential; (3) to substitute materials which were plentiful for those which were scarce; (4) standardization; (5) reduction of waste; (6) economy in samples; (7) economy in containers and packing. The length and swing of men's sack coats and overcoats and the width of facing were limited, the size of samples reduced and each manufacturer restricted to not more than 10 models of sack suits for the season. This resulted in a saving of from 12 to 15% of material. A saving of 33% of wool used in the knitting of sweaters was effected by the reduction in styles and colours. For example, only one shade of green was used where formerly there were many. Manufacturers of shoes were restricted to white, black and tan; wasteful features were eliminated and height limited. As a result one tanner reduced his line from 81 colours and shades to 3, and manufacturers in general reduced their line by about two-thirds. A schedule issued Sept. 13 1918 to manufacturers of rubber footwear provided for the elimination of 5,500 styles, with an estimated annual saving of 29,012,600 cartons, 5,245,300 sq. ft. of shipping and storage space, 2,250,272 lb. of material to be dyed, 74,750 lb. of starch, 30,380 gal. of varnish, 125,300 lb. of tissue paper and 49,617 days of labour.

In addition to the efforts of the War Industries Board there were numerous appeals by Government officials and patriotic organizations to conserve clothing and shoes. As a result a very great proportion of the people wore garments which in normal times would have been discarded. Patching and remaking of clothing became popular practices. Although it is impossible to estimate the saving effected, it is undoubtedly true that many millions of dollars, which would ordinarily have gone for the purchase of wearing apparel, were used to purchase Liberty Bonds and to aid various war philanthropies.

The Pulp and Paper Section of the War Industries Board was organized June 6 1918 to restrict the use of paper and its products and thus to save fuel, transportation and labour. On July 5 1918 the following preliminary economies were requested of all newspapers publishing daily and weekly editions: that they (1) discontinue acceptance of the return of unsold copies; (2) discontinue the use of all samples and complimentary copies; (3) discontinue giving copies to anybody except for office working copies or where required by statute law in the case of office advertising; (4) discontinue giving

free copies to advertisers except not more than one copy each for checking purposes; (5) discontinue arbitrary forcing of copies on news-dealers; (6) discontinue the buying back of papers at either wholesale or retail; (7) discontinue payment of salaries or commissions to agents, dealers or newsboys for the purpose of securing equivalent of return privileges; (8) discontinue all free exchanges. On Sept. 20 the following additional regulations went out: no publisher shall sell his paper at retail less than his published price; no publisher shall use premium contests or similar means to stimulate his circulation; no publisher shall issue holiday, industrial or Sunday special numbers. These regulations brought about a saving in paper during Sept. of 10.4% of the average monthly tonnage during the six months preceding and in Oct. of 5%. There was produced in Sept. 1918 104,209 tons and in Oct. 110,498 tons. All regulations relative to paper were withdrawn on Dec. 15 1918.

The universal response by the people of the United States to the request that they lend money to the Government to provide necessary funds for the prosecution of the war was one of the most significant things of the war period. Millions of people purchased Liberty Bonds and Victory Notes in various denominations from \$50 to \$10,000 (see LIBERTY LOAN PUBLICITY CAMPAIGNS), and other millions invested in the smaller War Savings securities. Early in the war President Wilson made the statement: "I doubt that many good by-products can come out of a war, but if our people learn from this war to save, then the war is worth all it has cost us in money and material." This statement, together with the desirability of having the entire nation participate in financing the war, suggested the underlying purpose behind the war savings movement, which was put into operation in Dec. 1917. Section 6 of the Second Liberty Bond Act, approved Sept. 24 1917, authorized the Secretary of the Treasury "to borrow from time to time on the credit of the United States for the purpose of this Act and to meet public expenditures authorized by law, such sums as in his judgment may be necessary and to issue therefor at such price or prices and upon such terms and conditions as he may determine War Savings Certificates of the United States on which interest to maturity may be discounted in advance at such rate or rates and computed in such manner as he may prescribe." The Act further provided that "each War Savings Certificate so issued shall be payable at such time, not exceeding five years from the date of its issue, and may be redeemable before maturity, upon such terms and conditions as the Secretary of the Treasury may prescribe." A limitation of \$2,000,000,000 was placed by the Act upon the amount of War Savings Certificates which might be outstanding at any one time; it also provided that no person should be sold at any one time certificates amounting to more than \$100, and it also placed a \$1,000 limitation upon the amount of certificates which might be held by any one person. The original Act was amended by the Act approved Sept. 24 1918, which increased the amount of certificates which might be issued from \$2,000,000,000 to \$4,000,000,000, removed the \$100 limitation on the amount of certificates which might be sold to any one person at any one time, and also altered the previous Act by allowing persons to hold an amount not to exceed \$1,000 worth of any series of certificates.

Pursuant to the authorization contained in the original Act, the Secretary of the Treasury appointed a committee of five, with Frank A. Vanderlip as chairman, to confer with him as to the form of security and the terms on which it should be issued. Following the recommendation of this committee, the Secretary of the Treasury offered for sale on Dec. 3 1917 an issue of War Savings Certificate Stamps, Series of 1918. Each certificate stamp when affixed to a War Savings Certificate (a folder with spaces for 20 stamps) would have a fixed maturity value of \$5, with the date of maturity not to exceed five years, the purchase price to vary one cent each month throughout the year of issue, beginning in Jan. at \$4.12, increasing to \$4.23 in December. The stamps might be redeemed before maturity, their redemption value increasing one cent each month. There were also provided 25-cent Thrift Stamps, bearing no interest and not redeemable for cash, but to be accumulated on a Thrift Card until there were 16, when they could be exchanged for a War Savings Certificate Stamp by paying the additional odd cents necessary to cover the current price of the War Savings Cer-

future. Nor was Sazonov the man to curry favour with Estonia, Latvia and Georgia, in order to obtain help, at the cost of a renunciation of the imperial interests of his country. (P. VI.)

SCAPA FLOW, an expanse of sea, in the S. of the Orkneys, bounded by Pomona on the N., Burray and South Ronaldshay on the E. and S.E., and Hoy on the W. and S.W. The area contains seven small islands and is about 15 m. in extreme length (N. to S.), and about 8 m. in mean breadth. There are two chief exits—one, 7 m. in length and 2 m. in mean breadth, into the Atlantic Ocean by Hoy Sound, and the other, 3½ m. in length by 2 m. in mean breadth, into the North Sea by Holm Sound. Scapa Flow contains several good anchorages, the best being Longhope in the island of Hoy. When the danger of a war with Germany came first to be apprehended, it was proposed to establish the chief British naval base, in the event of war, at Rosyth in the Firth of Forth, but it was afterwards decided that a larger base in a natural harbour farther N. would be required, and in 1912 it was proposed to construct defences both at Cromarty and at Scapa Flow. Permanent defences at Scapa were, however, abandoned in 1913, owing to the developments of submarine warfare, which rendered it very costly to protect the various entrances. Immediately on the outbreak of war, batteries were erected at Scapa and the Territorial Garrison Artillery of the Orkneys were mobilized to man them. Scapa Flow was preferred to the Cromarty Firth as his chief naval base by Admiral Jellicoe, but no preparations had been made and everything had to be improvised, guns being landed from the ships to strengthen the defences. The absence of preparations came to be felt more strongly with the rapid growth of the submarine menace, for the depth and number of the entrances made it a serious problem to establish adequate defences. By the middle of Oct. 1914, "U" boats were active in the neighbourhood of Scapa Flow, and on Oct. 16, an enemy submarine was reported to be in the Flow. The few capital ships which happened to be there went out to sea, and it was recognized that the base would be unsafe until anti-submarine defences were installed. While the necessary operations were in progress, the fleet occupied temporary bases in Skye and Mull and in the defended harbour of Lough Swilly in Ireland, and the absence of the fleet was successfully concealed. By the end of 1914, the entrances of Scapa Flow had been adequately protected, facilities for carrying out all but the most serious repairs were installed, and Scapa Flow gradually assumed the aspect of a great naval station, which it retained to the end of the war. As a precaution against espionage, navigation in the adjacent waters was very severely regulated, and a never-widening region of the mainland (ultimately extending as far S. as the Caledonian Canal) was proclaimed as a prohibited area. The German ships which were surrendered in Nov. 1918 were interned in Scapa Flow, where on June 21 1919, all the battleships and battle cruisers, with the exception of the battleship "Baden" and five light cruisers, were scuttled. Three light cruisers and some smaller vessels were beached.

SCARBOROUGH, England (see 24.301).—The pop. decreased from 38,161 in 1901 to 37,224 in 1911. In 1913 the municipal area was increased from 2,562 to 2,902 acres. The town was bombarded by a squadron of German cruisers on Dec. 16 1914; 8 persons were killed, 84 injured, and damage done to 231 buildings. On April 27 1917, it was ineffectually shelled by submarines, but in a second attack, on Sept. 4 of the same year, 3 persons were killed. The repair of the castle walls and keep, considerably damaged in the bombardment of Dec. 1914, was in progress in 1921.

Excavations of archaeological interest were carried out on the foundations of the old Northstead Manor House at Peasholme, and the remains of the Roman camp on Castle Hill have been bared and pined up. To the amenities of Scarborough were added during 1911-21: a bathing pool measuring 350 by 100 ft. at the foot of the cliff in South Cliff Gardens; a new Floral Hall of Glass in Alexandra Gardens; with accommodation for 1,500 people; Peasholme Park as a public garden, with a boating lake; and the Spa Promenade was extended and a bandstand and large café added. A town-planning scheme was prepared in 1921. Some industrial works were established in the decade, including a piano factory at the Mere, a motor-body works and a colour-printing works.

SCARFOGLIO, EDOARDO (1860-1917), Italian journalist, was born at Paganico (Aquila) in 1860, and died at Naples Oct. 6 1917. He was one of the most vigorous and ablest journalists of his time and an excellent newspaper manager as well as editor. He founded the *Corriere di Roma*, the *Corriere di Napoli*, the *Ora* of Palermo and the *Mattino* of Naples. It is with the latter paper, which he owned and edited for many years, that his name is chiefly associated. He was the husband of the novelist Matilde Serao (see 24.661), from whom, however, he had been separated for many years.

SCHARLIEB, MARY DACOMB (1845-), British surgeon, was born in London June 18 1845, the daughter of William Candler Bird. She was educated privately, and married a barrister who was then practising in India. She wished to study medicine, at that time an extremely difficult profession for a woman to adopt, and entered the medical college at Madras, receiving its diploma in 1878. She afterwards went to England and studied at the London School of Medicine for Women, taking her degree as Bachelor of Medicine and Surgery in 1882 with very high honours. In 1883 she returned to India, and became lecturer in midwifery and gynaecology at the Madras Medical College and examiner in the same subjects to the university of Madras. In 1888 she took her London degree of M.D., and from 1887 to 1902 was surgeon at the New Hospital for Women, being senior surgeon from 1889. In 1887 she was appointed lecturer on forensic medicine to the Royal Free Hospital, in 1889 lecturer on midwifery, and in 1902 chief gynaecologist. She retired from these posts in 1909. In 1917 Mrs. Scharlieb was made C.B.E. She was a member of the royal commission on Venereal Diseases (1913-16), and published *A Woman's Words to Women* (1905); *The Mother's Guide* (1905); *The Seven Ages of Woman* (1915); *The Hope of the Future* (1916); *The Welfare of the Expectant Mother* (1919).

SCHERER, REINHOLD (1863-), German admiral and ultimately commander-in-chief of the German battle fleet in the World War, was born Sept. 30 1863 at Obernkirchen in Hesse-Nassau. He served in the German colonial wars in Cameroon and E. Africa and was appointed in 1903 to the command of the 1st Torpedo Division. Subsequently he was for a time at the head of the Central Section in the Imperial Navy Office. In 1913 he was promoted to the rank of vice-admiral and was made commander of the 2nd squadron. In 1916 he was appointed to the command of the German battle fleet (Hochseeflotte). He was in command of the Fleet at the battle of Jutland, and in his book *Deutschland's Hochseeflotte im Weltkrieg* claimed to have won a victory there. In July 1918 he was made chief of the Admiralty staff and again in Aug. of the same year chief in command of the Fleet. In Dec. 1918 he was retired.

SCHNEIDERMAN, PHILIPP (1865-), German Social-Democratic leader, was born July 26 1865 at Kassel. He was by trade a printer, but in 1895 took to editing Socialist newspapers, first at Giessen and afterwards successively at Nürnberg, Offenbach and Kassel. In 1903 he was elected member of the Reichstag for the great industrial constituency of Solingen, and in the course of the World War he became the leader of the Social-Democratic party. In his reminiscences of the war period, which he published in 1920 under the title of *Der Zusammenbruch* (The Collapse), he gives an account of the attitude of the Socialist party as a whole at the beginning of the war, and of the change of policy which, to the disappointment of international socialism in other countries, led the German Socialists to give an all but unanimous vote in the Reichstag for the first war credits. He refers to the hurried visit of his Socialist colleague Hermann Müller to Paris on Aug. 1 1914 to discuss the situation with the French Socialists, and the effect of Müller's report, when with great difficulty he had managed to make his way back to Berlin. Scheidemann represented the attitude of the great majority of the Socialists in the Reichstag, if not in the country, by persistently supporting the Government in the main lines of its war policy, up to the months immediately before the so-called "Peace Resolution" of July 19 1917 at any rate. In conjunction with Erzberger he was one of the leading authors of this Resolution, which demanded "peace without annexation or indemnities." Before this date the

improvement in the position of the Socialist party in German political life had been shown by the way in which its leaders, particularly Scheidemann, were frequently called into conference with the imperial chancellor, Bethmann-Hollweg. Scheidemann, in his book, gives a vivid account of some of these conferences, and also of the celebrated interviews which the leaders of parties in turn had with Hindenburg and Ludendorff in Berlin when the army authorities endeavoured to obtain the modification of the so-called "Peace Resolution" before it was produced in public. It was largely owing to the firm attitude taken up by Scheidemann and the Majority Socialists that the chancellorship of the incompetent Michaelis (July to Oct. 1917) was brought to a close. In June 1918 Scheidemann was elected vice-president of the Reichstag, and on Oct. 3, on the formation of the last imperial Ministry by Prince Max of Baden, he received a secretaryship of State without portfolio. The part which he and his associates in the leadership of the Governmental or Majority Socialists played on the eve and on the outbreak of the Revolution was somewhat ambiguous. There is said to be evidence that, while insisting upon the abdication of William II. and the renunciation of the Crown Prince's rights of succession they were prepared to tolerate the continuance of the monarchical form of government in the shape of a regency, with, perhaps, the Crown Prince's eldest son, a young boy, as the prospective monarch. If this be so their plans were speedily brought to naught by the greater vigour of the Minority or Independent Socialists, led by Haase. The Independents had been active in sowing the seeds of revolution among the troops at the front, the sailors at Kiel and Wilhelmshafen, and the workmen in the munitions and other great factories. It was the Independents who forced the hand of Scheidemann and his associates by the arrangements which they had made in Berlin in the first week of Nov. 1918 for a general strike, a demonstration of the masses, and an appeal to the soldiers of the garrison to follow the example which had just been set in Kiel and other northern towns. And it was for this reason that the leaders of the Minority Socialists had to be admitted on equal terms and in equal numbers into the Provisional Government of the "Commissioners of the People," formed on Nov. 10 by Ebert, Scheidemann, Haase and three others. How little Scheidemann's party had been prepared for the course events took was shown by the fact that a proclamation appeared in the Socialist *Vorwärts* on Nov. 10, announcing that Prince Max of Baden in resigning the chancellorship had handed over the conduct of affairs to Ebert, who accordingly signed this proclamation as "Imperial Chancellor" (*Reichskanzler*). On Nov. 9, when the revolution in Berlin was slowly and, at first, peacefully spreading throughout the city, it was only after the announcement of the Kaiser's abdication had been published by Prince Max of Baden on his own initiative, at noon, and after the troops which were in occupation of the Reichstag building had thrown their rifles into the Spree and gone home, that Scheidemann appeared in front of that building at two o'clock and dramatically proclaimed the republic.

Scheidemann was closely associated with the policy, alleged to have been inevitable, which led the provisional and, afterwards, the first properly constituted republican Government to retain the services of reactionary officers and troops for the suppression of communist disorders. He was, therefore, together with Ebert and Noske made the subject of violent denunciations, not only by the Communists but also by the Minority Socialists after they had seceded from the Provisional Government at the beginning of Jan. 1919. When the National Constituent Assembly met at Weimar on Feb. 6 1919, Scheidemann was selected as president of the first regularly constituted republican Ministry of the Reich. He guided the affairs of Germany through the stormy period of the first half of 1919, when it repeatedly looked as if the communist insurrections, which broke out in various parts of the country, might result in the overthrow of the democratic republic and in an experiment in some kind of Bolshevism. On July 20 1919, being unable to agree to the signature of the Treaty of Versailles, he resigned with the rest

of his Ministry. He then resumed the leadership of the Majority Socialists in the National Assembly and subsequently in the first republican Reichstag. In Jan. 1920 he was elected chief burgomaster of his native town, Kassel.

SCHIFF, JACOB HENRY (1847-1920), American banker and philanthropist, was born at Frankfort-on-Main, Germany, Jan. 10 1847. He was educated in the schools of Frankfort and for a time worked in a banking house. In 1865 he went to New York City and two years later organized there the brokerage firm of Budge, Schiff & Co., which was dissolved in 1873. In 1875 he married a daughter of Solomon Loeb, head of the banking firm of Kuhn, Loeb & Co., was taken into the firm and, on Loeb's retirement in 1885, succeeded to the leadership. Meanwhile, largely due to Schiff's energy, the firm had greatly expanded its business and had become known throughout the financial world. In 1897 his house took an active part in reorganizing the Union Pacific railway, which later secured control of the Southern Pacific, assisting E. H. Harriman in these transactions. In 1901 a struggle took place between Schiff and the Harriman interests on the one side and James J. Hill and J. P. Morgan on the other for possession of the Northern Pacific railway. The resulting compromise was the formation of the Northern Securities Co. as a holding company for their joint interests (see 27.733). After the outbreak of the Russo-Japanese War in 1904 Schiff introduced Japanese war loans in America and subsequently was decorated by the Mikado. In his later years he gave much personal attention to charities, especially for the Jewish people, and on his seventieth birthday distributed \$700,000 among various charitable organizations and public institutions. He was a founder and president of the Montefiore Home for Chronic Invalids, New York City, and vice-president and trustee of the Baron de Hirsch Fund. In 1903 he presented a Semitic Museum to Harvard. He was vice-president of the N.Y. Chamber of Commerce and a director in many large corporations. He died in New York City Sept. 25 1920. His estate was estimated at about \$50,000,000. He bequeathed \$1,350,000 to various institutions, most of which had received benefactions during his life. The largest bequests were \$500,000 to the Federation for the support of Jewish Philanthropic Societies of New York City and \$300,000 to the Montefiore Home.

SCHIMMEL, HENDRIK JAN (1825-1906), Dutch poet and novelist (see 24.326), spent his last years in work on spiritualistic research. He died at Bussum in 1906.

SCHLESWIG.—The older "Schleswig-Holstein Question" (see 24.335) had an important sequel as the result of the World War, in the severing from Germany of part of Northern Schleswig.

The Peace of Vienna of 1864 had set up a joint administration of Schleswig-Holstein by Austria and Prussia. In the Peace of Prague (1866) Austria surrendered to Prussia her claims to both duchies. As regards the administration of Northern Schleswig (Nord Schleswig), an eventual cession to Denmark was reserved if the population should decide in this sense by a free vote. In 1878, however, Austria gave up this reservation, and Denmark in the Treaty of 1907 with Germany recognized that by the agreement between Austria and Prussia the frontier between Prussia and Denmark had finally been determined. The Danish population of Northern Schleswig had, it is true, never acquiesced in this settlement. Propaganda for union with Denmark never ceased, although it had greatly diminished in the years which preceded the World War. At the first elections for the Reichstag the Danes of Northern Schleswig won two seats, but after about 20 years they retained only one of them.

During the World War the movement in Northern Schleswig for separation from Prussia seemed to be in abeyance. It was only the Armistice of 1918, which gave prominence to certain points in President Wilson's programme, that once more inspired among the Danish population a vigorous demand for a plebiscite to decide the nationality of the North-Schleswigers. The Danish Government had at first adopted an attitude of reserve. But from the spring of 1919 onwards a propaganda was conducted in Copenhagen for "South Jutland," the chief leader in the movement being Hansen-Nørreholte, who till then had

been the representative of the Danish population in the German Reichstag. The German Government declared its readiness to apply President Wilson's programme for the "self-determination" of nationalities to the Danish portions of Northern Schleswig. The Treaty of Versailles provided for a plebiscite in that region. The original intention was to take the plebiscite throughout the whole of the Duchy of Schleswig, which for this purpose was to be divided into three zones. Finally, the idea of taking a plebiscite in the most southerly zone was abandoned, as the population of that district was purely German.

Article 109 of the Treaty established two zones for the plebiscite. The northern, or first, zone was bounded on the S. by a line passing through the islands of Röm and Sylt, keeping S. of Tondern, and then running to the N. of Flensburg, through the middle of the Flensburger Fjord, and leaving the island of Alsén to the N. of the line. The second zone included the islands of Sylt and Föhr and ran on, after bulging somewhat to the S. to the Flensburger Fjord on the east. Within this second zone lay Flensburg. The whole of the plebiscitary area had to be evacuated by the German troops and civil authorities within 10 days after the Treaty of Peace came into force. Powers of administration were transferred to an Inter-Allied Commission. In the first zone the plebiscite was to take place, at latest, three weeks after the German evacuation; in the second zone, at latest, five weeks after the plebiscite in the first zone. The decision regarding the assignment of territory to Denmark or to Germany on result of the plebiscite was to be taken on the proposal of the Inter-Allied Commission with due consideration for the special economic and geographical conditions of the region. The Danish Government appointed the former Reichstag deputy Hansen to the post of Danish minister for Schleswig, with the task of maintaining Danish interests in the plebiscitary area. All persons, without distinction of sex, who had completed their twentieth year and either had been born in the plebiscitary area or had lived there before Jan. 1 1900, were entitled to vote. On the German side, a German committee for Schleswig was formed, and was entrusted with German propaganda and preparations for the plebiscite.

On Jan. 15 1920 the Inter-Allied Commission, which had previously assembled at Copenhagen, took over the administration of the plebiscitary area. The German officials had to leave this territory, and their place was taken by native *Landrötte* and administrative officials appointed by the Commission. The German troops evacuated the region by Jan. 20. A battalion of British troops was stationed at Flensburg, a French battalion at Hadersleben and another at Sonderburg. The Inter-Allied Commission was composed of Marling (Great Britain), Claudel (France), Heyste (Norway), and von Sydow (Sweden). It promptly issued regulations for the plebiscite, dealing with the voting qualification and the registration of votes. A control over persons entering the plebiscitary area was also established. A vigorous propaganda was initiated both on the Danish and on the German side and led to a number of incidents especially at Flensburg. The plebiscite in the first zone took place on Feb. 10. On the whole it passed off quietly. It resulted in a great Danish majority; 75,151 votes were cast for Denmark and 25,231 for Germany. The larger towns, Tondern, Hoyer, etc., had in all cases a German majority, while the rural population, with the exception of a few German enclaves, voted almost in its entirety Danish. The campaign was much keener in the second zone, where the polling day had been fixed for March 14. There were sharp conflicts, particularly at Flensburg, where the burgomaster, Tødsen, was expelled by the Inter-Allied Commission. When a prohibition against the display of flags on the day of the plebiscite was issued on March 6, the German assessors of the Inter-Allied Commission resigned their posts. Repeated collisions with the French troops of occupation took place at Flensburg, and were not unattended by bloodshed. The plebiscite resulted in a great German success; about 51,000 votes were recorded for Germany and only 13,000 for Denmark. There were only two communes which had a Danish majority.

The determination of the frontier took a long time. Germany advocated the so-called Tiedje line, while on the Danish side propaganda was made for the so-called Clausen line. The Council of Ambassadors of the Allies gave its decision at the beginning of June. On June 15 the president of the Paris Peace Conference handed the German delegation a note in which the German-Danish frontier was fixed as follows. It begins at the entrance to the Flensburger Fjord, passes through the middle of that fjord, reaches the mainland immediately to the N. of Flensburg, leaves Flensburg to the S. and then follows a line which reaches the North Sea at Sieltoft. The island of Sylt falls to Germany, the island of Röm to Denmark. On the whole this meant the adoption of the Clausen line. The territory assigned to Denmark was at once handed over to her on June 15, while the territory that remained German was forthwith placed once more under German administration. German troops reentered Flensburg on June 16 after the members of the Inter-Allied Commission had left the town.

The detailed settlement of the territory to be ceded to Denmark was effected by a treaty concluded between Germany and Denmark and signed in the middle of July. At the beginning of July Denmark gradually took over the administration of the ceded districts, the administration of justice being the last department to become Danish. It is worth noting that the day of the plebiscite in the second zone coincided with the *Kapp Putsch* in Berlin. (C. K.)

SCHLICH, SIR WILLIAM (1840-), British forestry expert, was born at Darmstadt Feb. 28 1840, and educated there and at the university of Giessen. In 1866 he entered the Indian Forests Department, became conservator of Forests in 1871, and ten years later inspector-general of Forests to the Government of India. He was one of the pioneers of the study of forestry in England, organizing the first school at Cooper's Hill, which was afterwards transferred to Oxford in 1905. He was appointed professor of Forestry at Oxford the same year. Among his books on the subject are *A Manual of Forestry* (1880-95; 3 vols.), and *Forestry in the United Kingdom* (1904). In 1901 he was elected a fellow of the Royal Society, and in 1909 he was created K.C.I.E.

SCHMOLLER, GUSTAV (1838-1917), German political economist (see 24.344), died in 1917.

SCHOLL, AURELIEN (1833-1902), French author (see 24.356), died in Paris April 16 1902.

SCHÖNAICH, FRANZ, FREIHERR VON (1843-1916), Austro-Hungarian general of infantry and Minister of War, was born at Vienna in 1843, and entered the army as a lieutenant in 1861. He spent the greater part of his service on the general staff and on special employments, especially as a chief of sections in the War Ministry. For a short time in command of the IX. Corps he became head of the Austrian Imperial Ministry of Defence, after which he took over the charge of the Imperial War Ministry. Schönaich had an attractive personality, was a practised orator, and well-informed in political matters. Therefore he knew how to maintain good relations with the parliamentary parties, to whom his capacity as an organizer, in the crisis of the winter of 1908-9 (the annexation of Bosnia and Herzegovina), was of great advantage. He was less successful in connexion with the Defence Act of 1911, the financial basis of which he was only able to arrange with important restrictions and serious limitations. In this matter he came into conflict with other influential personages, a circumstance which led to his retirement in the autumn of 1911. During the World War he was in supreme command of the War Provisioning Department, and died at that post in the spring of 1916.

SCHOULER, JAMES (1839-), American lawyer and historian (see 24.377), published in 1913 a seventh volume of his *History of the United States of America Under the Constitution*, covering the period of reconstruction (1865-71). The original plan of his work had been enlarged by the publication in 1899 of a sixth volume, covering the period 1861-5.

SCHREINER, OLIVE (c.1862-1920), pen-name of Mrs. Cronwright Schreiner, was born in Basutoland, the daughter of a German missionary sent out by the London missionary

society. She was a sister of W. P. Schreiner, afterwards Prime Minister of Cape Colony, and married in 1894 Mr. S. C. Cronwright, also a S. African politician. Early in 1882, when she was 20 years old, she brought to England the MS. of her first novel, *The Story of an African Farm*, and submitted it first to George Meredith, then reader for Chapman & Hall. He praised the book and suggested certain alterations, most of which she accepted. Eventually it was published by the firm in 1883, over the pseudonym "Ralph Iron." Its success was immediate, but nothing else that she wrote had quite the same literary quality. Her later work includes *Dreams* (1891); *Trooper Peter Halsett of Mafeking* (1897), a much-criticized attack on the first settlers in Rhodesia; *An English South African's View of the Situation* (1899); and *Woman and Labour* (1911), a fragment of an earlier MS. which had been burnt with other papers during the S. African War. She died at Cape Town in Dec. 1920.

SCHREINER, WILLIAM PHILIP (1857-1919), South African lawyer and statesman, the youngest son of a German missionary, was born in the district of Herschel, Cape Colony. He studied law at Cape Town and at Cambridge and London universities. He was called to the bar (Inner Temple) in 1882 and the same year returned to the Cape where he was admitted an advocate of the Supreme Court. He soon attained success and was for many years leader of the Cape bar. In 1893 Schreiner, who had been legal adviser to the High Commissioner since 1887, began his political career as attorney-general in the second Ministry of Cecil Rhodes. He resigned the same year, took the same portfolio again in Sept. 1894 and remained in office until the Jameson Raid brought about the downfall of the Rhodes Ministry. In 1898, having helped to bring about the fall of the Sprigg Ministry, Schreiner became Prime Minister of Cape Colony and held that position when the Anglo-Boer War of 1899-1902 began. During the crisis which preceded the outbreak of hostilities he allowed the passage of armaments to the Dutch republics, and when the war broke out he wished to keep Cape Colony neutral (see 5. 244). Acute differences in the Cabinet caused Schreiner to resign office in June 1900. Later he advocated, unsuccessfully, the federation instead of the unification of the South African colonies. In 1914 he accepted the office of High Commissioner of the Union in London and held that post until his death. He died at Llandrindod Wells on June 28 1919. Schreiner married, in 1884, Frances, sister of F. W. Reitz, President of the Orange Free State. He was a brother of Olive Schreiner, the novelist. Schreiner was a man of high attainments, great industry and impressive speech. His qualities showed at their best at the bar, and the proper crown of his career would have been a seat on the bench. But as a politician he suffered from a lack of suppleness which disqualified him from becoming a popular leader. He had also too much of the cross-bench mind. He was a sincere friend of the natives, and, in 1908-9 successfully defended Dinizulu against the charges of treason and murder brought against him. He also went to London as a delegate of the Coloured Races Political Association to oppose restrictions in the Act of Union.

SCHULTZ, HERMANN (1836-1903), German theologian (see 24.382), died in 1903.

SCHURMAN, JACOB GOULD (1854-), American educationist (see 24.386), was appointed in 1912 U.S. minister to Greece and Montenegro, serving one year. During the World War, when Germany began unrestricted submarine warfare, he urged that American rights be firmly insisted upon; he pointed out that the destruction of the "Lusitania" in 1915 threatened to efface the distinction between combatants and non-combatants long recognized by civilized peoples. In 1915 he was first vice-president of the N.Y. State Constitutional Convention. In Oct. 1917 he was appointed a member of the N.Y. State Food Commission, resigning in June 1918 to go to France as lecturer to American soldiers under the auspices of the Y.M.C.A. He was opposed to many of President Wilson's policies, especially in connexion with Mexico, and also to Article X. of the Covenant of the League of Nations, believing that it would involve the United States in war. As early as 1913 he urged the independence

of the Philippines in the near future; in 1914 he declared in favour of woman suffrage. He resigned the presidency of Cornell University in 1920. He was appointed minister to China in 1921. He was the author of *The Balkan Wars 1912-1913* (1914, lectures at Princeton).

SCHUSTER, SIR ARTHUR (1851-), British physicist, was born in Frankfort-on-Main Sept. 12 1851, the son of Francis Joseph Schuster, of Frankfort, who in early life made his home in London, where he carried on a successful business as merchant-banker in Cannon St., his three sons, Ernest Joseph (b.1850), subsequently a well-known lawyer, Arthur, and Felix (see below), being brought up, like himself, as British subjects. Arthur Schuster was educated at Owens College, Manchester, and at Heidelberg University, and devoted himself to a scientific career as an astronomer and mathematical physicist. He was chief of the "Eclipse" expedition to Siam in 1875, and from 1888 to 1907 was professor of physics in Manchester University, his main work for many years being connected with advanced research in spectroscopy, on which subject he contributed the article in the 9th ed. of the *E.B.* in 1887 (as also to the 11th ed. in 1910). He was awarded the royal medal of the Royal Society in 1893, and was one of the secretaries of the Royal Society from 1912 till 1920. He was president of the British Association in 1915, having in 1892 acted as sectional president for astronomy, and he became well known throughout the scientific world, receiving hon. degrees from both Oxford and Cambridge. He was also secretary of the International Research Council, and during the World War, both in that capacity and as a representative of the Royal Society, he did invaluable work as a scientific adviser in connexion with the organization of research in various departments. He was knighted in 1920, and was appointed a member of the royal commission on the universities of Oxford and Cambridge. His numerous publications include works on *Theory of Optics* (2nd ed. 1909), *The Progress of Physics* (1911) and *Britain's Heritage of Science* (1917).

His brother, **SIR FELIX SCHUSTER, Bart.** (1854-), was also educated at Owens College, Manchester, and studied further abroad, afterwards making his career in London banking. From 1895 he was identified, as governor, with the Union Bank of London, afterwards the Union of London & Smiths Bank, and in 1918 amalgamated with the National Provincial Bank as the National Provincial & Union Bank of England. He was a member of the Council of India from 1906 to 1916, and became chairman both of the Central Association of Bankers and of the Committee of London Clearing Banks. In these years he established for himself a leading position in financial and economic circles, and was made a member of several important Government committees and royal commissions, his annual addresses to the shareholders of his bank being recognized, with those of Sir Edward Holden (of the London, City & Midland Bank), as among the most important contributions of the day to sound thinking on current monetary problems. He was created a baronet in 1906.

SCHWAB, CHARLES MICHAEL (1862-), American capitalist, was born at Williamsburg, Pa., April 18 1862. He was educated in the public schools and at St. Francis College, Loretto, Pa., where he gained an elementary knowledge of engineering. From 1878 to 1880 he was a clerk in a store at Braddock, Pa., and then became a stake driver in the engineering corps of the Edgar Thomson Steel Works of Carnegie Bros. & Co. His ability brought him rapid promotion and in 1881 he was made chief engineer and assistant manager. Six years later he was appointed superintendent of the Homestead Steel Works. In 1889, on the recommendation of Henry Frick, he was made general superintendent of the Edgar Thomson Steel Works, and in 1892, after the formation of the Carnegie Steel Co., he was made also general superintendent of the Homestead Works. In 1897 he was elected president of the Carnegie Steel Co., and when this was merged in 1901 in the U.S. Steel Corp. he was made president of the latter. He resigned in 1903. He then turned his attention to shipbuilding and a few years later with other capitalists secured control of the Bethlehem Steel Corp.,

which owned the Bethlehem Steel Co., and several other corporations engaged in the iron, steel and shipbuilding business. He was made chairman of the board of directors. After the outbreak of the World War in 1914 and before the United States entered it, these companies filled orders for the Allies aggregating between 400 and 500 million dollars. The manufacture of submarines for England raised the question of neutrality, but this was solved by shipping parts to Canada, where they were assembled. It was generally understood that German interests made attempts to secure control of the Bethlehem works in order to shut off munitions from the Allies, and a report that Mr. Schwab was offered \$100,000,000 for his interest was not only widely published but was given prominence in a reception given to him by the New York Chamber of Commerce, and neither then nor at any other time denied by Mr. Schwab. After America's entrance into the war special attention was given to the speeding up of shipbuilding, and in April 1918, at the urgent request of President Wilson, Mr. Schwab became director-general of the shipbuilding board of the Emergency Fleet Corp. His power of rousing enthusiasm among workers by personal contact began immediately to produce results. The resulting output for 1918 was 410 steel vessels (2,570,077 deadweight tonnage), 106 wooden ships (376,480 deadweight tonnage), and 10 composite ships (37,500 deadweight tonnage), a total of 526 vessels. After the signing of the Armistice in Nov. 1918, feeling that his services were no longer required, he resigned from the Emergency Fleet Corp. in Dec. and returned to his position as chairman of the board of directors of the Bethlehem Steel Corp. Later, charges were brought that he had wrongfully used Government money for expenses unrelated to public duties during his tenure of office, but official investigation completely exonerated him. His benefactions include a Catholic church at Loretto, as well as buildings and endowment for St. Francis College; a church at Braddock, Pa., a school at Weatherly, Pa., and a country home on Staten Island, N.Y., for children of the New York Foundling Hospital.

SCIENTIFIC MANAGEMENT.—This is one of the names adopted for a certain body of principles and methods of management which have been propounded as applicable to industrial undertakings, other names being Efficiency Engineering and Industrial Management. Developed in the United States, mainly since about 1905, and particularly in connexion with engineering work, the methods of Scientific Management have exercised a profound influence on methods of factory management in England and on the continent of Europe, as well as in America. Though applicable to most of the problems of industrial administration, they have in fact been worked out mainly in connexion with the control of workshop processes.

The theory underlying Scientific Management is briefly that there is "one best way" of doing every act that has to be performed in a workshop, and that it is the duty of the management to discover that "one best way" and to make such arrangements as will ensure that it is always carried out. The method of procedure may be indicated by propounding the following three questions:—

1. What are the factors which limit the speed of a particular workshop process or machine?
2. Why is it that the volume of output from a particular process is always less at the end of the week than the product of the speed of the process or of the machine, multiplied by the working hours in the week, would lead one to expect?
3. Why do some workers produce so much more than others working under the same conditions?

An attempt to discover full answers to these questions leads to very far-reaching inquiries, and radical changes in organization and administrative methods may become necessary if the results of such inquiries are to be put to effective use.

Thus, the investigations prompted by the first question may be expected to lead to modifications of the mechanism and construction of a machine to enable it to run faster; to modifications of tools or appliances used; to changes of the material used for machine parts, for tools or for accessory purposes. Changes in the design of the work to be done might also follow, which, while

leaving the product just as suitable for its purpose as before, would enable the process to be carried out faster. A different method of handling the work, the machine or the tools might be developed, involving a new series of motions on the part of the workman which would result in a saving of time. Not only would specific improvements be made of the kind suggested above, but the effect of each of the many elements which influenced and limited the speed of a process would be reduced to a law, the knowledge of which would save a great deal of experimentation in applying the process to changed conditions.

Investigation of the second question might lead to equally valuable discoveries. For instance, it might be found that the process was stopped altogether for portions of the working week for such reasons as lack of continuous supply of material to be worked on; changes of the "set-up" of a machine due to change in the nature of the work to be done; breakdowns of the machine; adjusting or sharpening of tools; waiting for instructions and many other possible causes. The attempt to remedy these would lead to the development of methods of work-control and planning. These would aim at ensuring that material was always ready to hand to be worked on; that all work of a like nature was carried through at the one time, to avoid needless resetting of machines; that tools and appliances were ready to hand; that instructions as to the next job were prepared and ready in advance; that the nature of each new piece of work was clearly described and so on. Schemes of periodic inspection or adjustment of machines or tools might be indicated in order to reduce time lost through breakdowns.

The third question would lead to the discovery that different workmen had slightly different ways of doing the same thing, and that the ways of the faster workers could be explained to and adopted by the others; that some workers were temperamentally more suited to a particular kind of work than others; that some were not trying; that others were trying too hard and were worrying themselves by their failure; that in some cases the relations between the workmen and the foreman were happy and in other cases not.

The remedying of these troubles would lead to careful methods of choosing workmen for particular jobs, to ensure that men of suitable temperament as well as capacity and skill were employed; to schemes of instruction for showing the worker exactly what was required of him, and for teaching him the methods which had been found to be the best for carrying out the work in question. A scheme of payment by result might be developed, to give the workman the necessary incentive to ensure that he would profit by the instruction given him and would follow the methods laid down. The methods of control, the relationship of the various grades of personnel and the demarcation of the spheres of authority of the various officers of the workshop might also require rearranging, to allow of the foregoing changes and to ensure satisfactory relations between the workmen and those directing them. Built up on the result of such investigations as have been indicated, a variety of systems of management have grown up, one emphasizing one factor and another specializing in another direction, and all known by the general description of Scientific Management.

The origin of the movement is traceable to the work of F. W. Taylor, an American engineer, for many years a manager in the works of the Bethlehem Steel Co., Midvale, Pa. His investigations, leading later to the development of his methods and principles of management, sprang from the attempt on his part to lay down a standard fair day's work and to see that he got it from the men under his control. This led him into a deep analysis of the elements affecting the amount of work that could be done in a given time, and in turn by the kind of steps already indicated to the formulation of his system. One of the largest single pieces of investigation carried through by him was concerned with establishing the laws governing the rate of removal of metal by cutting-tools in a machine. This was carried on at intervals during 26 years. One result of it was the discovery in 1899 of modifications in the composition of tool steel from which the modern high-speed steel was developed. The whole results were

society. She was a sister of W. P. Schreiner, afterwards Prime Minister of Cape Colony, and married in 1894 Mr. S. C. Cronwright, also a S. African politician. Early in 1882, when she was 20 years old, she brought to England the MS. of her first novel, *The Story of an African Farm*, and submitted it first to George Meredith, then reader for Chapman & Hall. He praised the book and suggested certain alterations, most of which she accepted. Eventually it was published by the firm in 1883, over the pseudonym "Ralph Iron." Its success was immediate, but nothing else that she wrote had quite the same literary quality. Her later work includes *Dreams* (1891); *Trooper Peter Halsett of Mafeking* (1897), a much-criticized attack on the first settlers in Rhodesia; *An English South African's View of the Situation* (1899); and *Woman and Labour* (1911), a fragment of an earlier MS. which had been burnt with other papers during the S. African War. She died at Cape Town in Dec. 1920.

SCHREINER, WILLIAM PHILIP (1857-1919), South African lawyer and statesman, the youngest son of a German missionary, was born in the district of Herschel, Cape Colony. He studied law at Cape Town and at Cambridge and London universities. He was called to the bar (Inner Temple) in 1882 and the same year returned to the Cape where he was admitted an advocate of the Supreme Court. He soon attained success and was for many years leader of the Cape bar. In 1893 Schreiner, who had been legal adviser to the High Commissioner since 1887, began his political career as attorney-general in the second Ministry of Cecil Rhodes. He resigned the same year, took the same portfolio again in Sept. 1894 and remained in office until the Jameson Raid brought about the downfall of the Rhodes Ministry. In 1898, having helped to bring about the fall of the Sprigg Ministry, Schreiner became Prime Minister of Cape Colony and held that position when the Anglo-Boer War of 1899-1902 began. During the crisis which preceded the outbreak of hostilities he allowed the passage of armaments to the Dutch republics, and when the war broke out he wished to keep Cape Colony neutral (see 5. 244). Acute differences in the Cabinet caused Schreiner to resign office in June 1900. Later he advocated, unsuccessfully, the federation instead of the unification of the South African colonies. In 1914 he accepted the office of High Commissioner of the Union in London and held that post until his death. He died at Llandrindod Wells on June 28 1919. Schreiner married, in 1884, Frances, sister of F. W. Reitz, President of the Orange Free State. He was a brother of Olive Schreiner, the novelist. Schreiner was a man of high attainments, great industry and impressive speech. His qualities showed at their best at the bar, and the proper crown of his career would have been a seat on the bench. But as a politician he suffered from a lack of suppleness which disqualified him from becoming a popular leader. He had also too much of the cross-bench mind. He was a sincere friend of the natives, and, in 1908-9 successfully defended Dinizulu against the charges of treason and murder brought against him. He also went to London as a delegate of the Coloured Races Political Association to oppose restrictions in the Act of Union.

SCHULTZ, HERMANN (1836-1903), German theologian (see 24.382), died in 1903.

SCHURMAN, JACOB GOULD (1854-), American educationist (see 24.386), was appointed in 1912 U.S. minister to Greece and Montenegro, serving one year. During the World War, when Germany began unrestricted submarine warfare, he urged that American rights be firmly insisted upon; he pointed out that the destruction of the "Lusitania" in 1915 threatened to efface the distinction between combatants and non-combatants long recognized by civilized peoples. In 1915 he was first vice-president of the N.Y. State Constitutional Convention. In Oct. 1917 he was appointed a member of the N.Y. State Food Commission, resigning in June 1918 to go to France as lecturer to American soldiers under the auspices of the Y.M.C.A. He was opposed to many of President Wilson's policies, especially in connexion with Mexico, and also to Article X. of the Covenant of the League of Nations, believing that it would involve the United States in war. As early as 1913 he urged the independence

of the Philippines in the near future; in 1914 he declared in favour of woman suffrage. He resigned the presidency of Cornell University in 1920. He was appointed minister to China in 1921. He was the author of *The Balkan Wars 1912-1913* (1914, lectures at Princeton).

SCHUSTER, SIR ARTHUR (1851-), British physicist, was born in Frankfort-on-Main Sept. 12 1851, the son of Francis Joseph Schuster, of Frankfort, who in early life made his home in London, where he carried on a successful business as merchant-banker in Cannon St., his three sons, Ernest Joseph (b.1850), subsequently a well-known lawyer, Arthur, and Felix (see below), being brought up, like himself, as British subjects. Arthur Schuster was educated at Owens College, Manchester, and at Heidelberg University, and devoted himself to a scientific career as an astronomer and mathematical physicist. He was chief of the "Eclipse" expedition to Siam in 1875, and from 1888 to 1907 was professor of physics in Manchester University, his main work for many years being connected with advanced research in spectroscopy, on which subject he contributed the article in the 9th ed. of the *E.B.* in 1887 (as also to the 11th ed. in 1910). He was awarded the royal medal of the Royal Society in 1893, and was one of the secretaries of the Royal Society from 1912 till 1920. He was president of the British Association in 1915, having in 1892 acted as sectional president for astronomy, and he became well known throughout the scientific world, receiving hon. degrees from both Oxford and Cambridge. He was also secretary of the International Research Council, and during the World War, both in that capacity and as a representative of the Royal Society, he did invaluable work as a scientific adviser in connexion with the organization of research in various departments. He was knighted in 1920, and was appointed a member of the royal commission on the universities of Oxford and Cambridge. His numerous publications include works on *Theory of Optics* (2nd ed. 1909), *The Progress of Physics* (1911) and *Britain's Heritage of Science* (1917).

His brother, **SIR FELIX SCHUSTER, Bart.** (1854-), was also educated at Owens College, Manchester, and studied further abroad, afterwards making his career in London banking. From 1895 he was identified, as governor, with the Union Bank of London, afterwards the Union of London & Smiths Bank, and in 1918 amalgamated with the National Provincial Bank as the National Provincial & Union Bank of England. He was a member of the Council of India from 1906 to 1916, and became chairman both of the Central Association of Bankers and of the Committee of London Clearing Banks. In these years he established for himself a leading position in financial and economic circles, and was made a member of several important Government committees and royal commissions, his annual addresses to the shareholders of his bank being recognized, with those of Sir Edward Holden (of the London, City & Midland Bank), as among the most important contributions of the day to sound thinking on current monetary problems. He was created a baronet in 1906.

SCHWAB, CHARLES MICHAEL (1862-), American capitalist, was born at Williamsburg, Pa., April 18 1862. He was educated in the public schools and at St. Francis College, Loretto, Pa., where he gained an elementary knowledge of engineering. From 1878 to 1880 he was a clerk in a store at Braddock, Pa., and then became a stake driver in the engineering corps of the Edgar Thomson Steel Works of Carnegie Bros. & Co. His ability brought him rapid promotion and in 1881 he was made chief engineer and assistant manager. Six years later he was appointed superintendent of the Homestead Steel Works. In 1889, on the recommendation of Henry Frick, he was made general superintendent of the Edgar Thomson Steel Works, and in 1892, after the formation of the Carnegie Steel Co., he was made also general superintendent of the Homestead Works. In 1897 he was elected president of the Carnegie Steel Co., and when this was merged in 1901 in the U.S. Steel Corp. he was made president of the latter. He resigned in 1903. He then turned his attention to shipbuilding and a few years later with other capitalists secured control of the Bethlehem Steel Corp.,

would now receive his orders from perhaps half a dozen experts. One told him which job to do next, or in what order to do a series of jobs. Another supplied him with the instructions as to the nature of the work to be done or the article to be worked on. Another told him at what speed to run his machine. Another saw to the upkeep of the machine; another set the piece rate; another judged the quality of the product, and so on. Behind each of these functional foremen was a special department looking after a particular aspect of management, of which he was the mouthpiece, as far as the workman was concerned.

This rigid and literal working-out of Taylor's idea of "management by experts" had usually to be modified in practice on account of the friction and confusion it almost inevitably led to, due to the difficulty of defining sufficiently clearly the sphere of each functional foreman, or to the clash of personalities.

Harrington Emerson embodied the necessary modification of Taylor's scheme in his plan of "Staff and Line" organization, published in 1909. In this the usual chain of executive authority, the "line," was maintained, by which a group of men was wholly answerable to a single foreman, a group of foremen to a departmental manager, several of these to a works manager, and so on. The experts, on the other hand, were collected into special "staff" departments, and their functions were to advise or instruct the "line" officials as to what instructions should be given, or how their work could best be done. This plan gives scope in the line organization for that personal leadership which was fatally destroyed by Taylor's functional foremanship, but still enables the methods of work and the technical policy to be laid down by experts in the various functions.

The last of the three questions propounded at the beginning of this article did not receive the same amount of attention as the other two at the hands of any of the leaders of the Scientific Management school of thought. Taylor in his paper on Shop Management (1903) does, it is true, make a feature of selection of the worker to suit the job, but his ideas in this direction were very different from those of the later school of applied psychology. Taylor's aim was the discovery, by records of individual performance, which men were as a matter of fact most successful in carrying out the task set them. The less successful were to be shown the correct methods of working, but if they still failed to reach the predetermined level of achievement, which was that of a good man, not an average worker, they were to be discharged to make room for others. A follower of Taylor, Dr. Katherine Blackford, made an attempt at selection of the workers beforehand, in distinction to Taylor's selection by trial and error on the job. In her book, *The Job, the Man and the Boss* (1914), she attempted to devise tests which should indicate the capacity of men for various kinds of work, i.e. their chance of making good if taken on and given trial. In view of the recent progress of applied psychology in this field, her work is not, however, worthy of serious consideration.

It may be useful to summarize the features embodied in Scientific Management systems as actually applied to an industrial undertaking.

Standardisation of all machines doing similar work; of all factory equipment, e.g. driving and power transmission gear, factory furniture, etc.; of all tools and appliances; of materials to be worked on; of routines; of quality of work, etc. The maintenance of the standards usually necessitates several special departments, e.g. for inspection of quality, for upkeep of machines and tools, for dissemination of information, etc.

Time and Motion Study.—Time studies are made of the elements of all jobs, as distinct from overall times. Motion study is a development of time study, being an analysis by special methods (including photographic and even cinematographic) of the motions involved in an element of work. From this study motions or parts of motions which are useless are eliminated and the new method taught to the workers. The results of time and motion studies are embodied in written instructions for the use of the worker. These are in considerable detail, covering not only a full description of the work to be done but also of the exact methods of doing it, the tools to be used, the "setting" of the machine, etc., with times for each element both of the machine's work and the work of handling.

Payment by Result.—Some schemes of extra payment for the superior performance of the task as laid down in the instruction based time study.

Functional Management.—This may vary from complete functional foremanship to functional study of methods, technique and procedure, the results being conveyed to the workman via a departmental foreman.

Planning.—A special functional department is charged with laying down the order of preference of all work, the sequence of operations or moves through which each job has to pass, the arranging beforehand that all material, tools, appliances, etc., shall be on hand for each job when needed, the conveying of all instructions either to the foreman or to the workman according to the degree of functional management in operation. The planning department is also the central statistical bureau of the factory where all records of the state of advancement of all jobs, of costs, of machines available, often of stores, of men available, etc., are kept.

These features do not exhaust all the functions of management, but may be taken as those which distinguish Scientific Management schemes of organization from earlier types. Of course, certain of these features have been selected and applied in many instances where the full and complete scheme has not been adopted. A scheme which could claim to be ranked among the instances of Scientific Management would, however, include all the above features.

This account would not be complete without some mention of the attitude of labour to Scientific Management. Taylor himself, and later some of his followers, made extravagant claims to the effect that the new methods, by enabling standards of work to be laid down and the worker's achievement to be measured and his exertion rewarded on a prearranged scale, solved the labour problem. Not only has this happy result failed to materialize, but the attitude of labour, suspicious at the outset, has tended to harden into declared antagonism. The extension of the system in America was opposed more and more vigorously as time went on, leading to a serious strike against it in the Watertown Arsenal in 1917.

As a result of growing antagonism the United States Commission on Industrial Relations in 1914 directed that an investigation into the working of Scientific Management should be made, and appointed for this purpose Prof. R. F. Hoxie, of the university of Chicago, with the assistance of a Scientific Management expert and a labour leader. This Commission visited many of the chief establishments in the United States at which Scientific Management was in operation, and its findings are given in Prof. Hoxie's book *Scientific Management and Labor*. Everywhere the investigators found labour antagonistic; the objections which, with minor ones, appear to be fundamental were as follows:—

The system leads to "driving" the worker and to sweating, due to its attempt to speed up all to the speed of the fastest.

The minute splitting up of jobs leads to very much increased specialization of the worker, to the narrowing of his range of skill, and consequently to the destruction of craftsmanship. The work became more monotonous and less satisfying to the worker.

It was claimed that the individual task and reward, and the constant selecting of the fastest workers, destroyed the solidarity of the workers in a factory. The knowledge of a "trade" was no longer necessary to the workmen; all the specialized knowledge having been acquired by the management, the workman had less to sell than previously.

For these and other reasons it was claimed by the workers that the system was anti-social; that it was undemocratic; that it treated the worker as a tool, denied him scope for his personality, and condemned him to endless routine meticulously laid down and arbitrarily enforced.

There can be no doubt that much of the resentment of labour has been aroused by the personality and mental attitude of the Scientific Management experts and the staffs they created in the works which they reorganized, rather than by the fundamental ideas of their system. Their conception of industry was entirely mechanical. Their organizations were ingenious structures of men, machines and routines. Each of these had its place in their buildings, but like steel, brick and cement, though differing in their qualities, all alike were simply building materials, inanimate and obedient to the hand of the builder.

This cast of mind inevitably bred bitter antagonism in labour, and by the year 1921 there was already distinct evidence of a change on the part of the most advanced organizers, both in America and in England. It was significant of this change that Taylor's scheme of functional foremanship had come to be re-

garded as mistaken even by many of his closest followers, who were inclining to believe that in forfeiting the vital factor of personal leadership the loss was greater than could be compensated for by any amount of intensification of expert knowledge. There was a growing tendency too, to concentrate study and standardization on the inanimate side of industry, on machines, tools and equipment, on materials and their treatment, on handling methods and appliances, on labour-saving devices, rather than on speeding up and regulating the motions of the worker. The same distinction was seen in the attitude of British labour leaders to Scientific Management. Among the more intellectual leaders the accumulation of more and more of the technical knowledge of an industry in the hands of the management and the more detailed regulation and instruction of the manual worker which results were recognized as inevitable. They were seen to be merely a continuation of the process of replacing hand labour and hand skill by machinery. Such men accepted the need for the application of science to industry as far as the inanimate factors were concerned, and concentrated their antagonism against the treatment of the worker as mere impersonal mechanism.

By the end of the World War some 100-200 American undertakings, largely engineering concerns, had adopted Scientific Management in one or another of its forms, as a complete system. In Great Britain the number of such firms was perhaps one-tenth of those in America, and the positions in France and Germany were perhaps less advanced still. The influence of the movement, however, cannot be estimated by any such figures. For every concern that had adopted the system in its entirety there were 10 or 20 that had adopted portions of it, or had modified their previous methods of management under the influence of ideas first given prominence by the Scientific Management school. The conception of "the one best way," the belief that every act, every relation and every implement of industry is worthy of close and systematic study, has provided an inspiration and a stimulus to management methods in all industries and in every country, the effect of which can hardly be less than that of the introduction into industry of machinery a hundred years ago. (C. G. R.)

SCOTLAND (see 24.412*).—The history of Scotland from 1910 to 1921 resolves itself largely into the effect of the World War (1914-9) and of the conclusion of peace upon industry and commerce. In the history of actual military operations, Scotland played, naturally, a small part, although for the first time in the history of Great Britain as a sea-power, the main activities of the fleet took place in Scottish waters. Zeppelins attacked Edinburgh and the E. coast on April 2 1916. On May 2, in the course of a raid which was upon an unusually large scale, but had very slight results, a Zeppelin (Lao) missed Edinburgh and sailed as far N. as Aberdeenshire, where it dropped bombs which fell harmlessly on fields. Another fruitless expedition to the S.E. of Scotland took place on Aug. 9 1916; the raiders got into thick weather and their bombs were dropped in rural areas. On May 15 1918, St. Kilda was bombarded by a German submarine and damage was done to the church and some other buildings. The surrender of the German fleet is the only other operation definitely associated with Scotland. German naval emissaries arrived in the Firth of Forth on Nov. 15 1918, and the surrender began on Nov. 21. It was in Scapa Flow that the crews of 70 German warships scuttled their ships on June 21 1919.

The part played by Scotland in supplying man-power and in providing munitions of war was worthy of the national tradition. The Scottish recruiting record in the period preceding the introduction of compulsory service will compare with that of any other portion of the United Kingdom, and Scottish industries, like those of England and Wales, were directed to the production of war material. The Clyde, naturally, took a large part in naval construction and repairs, and all over Scotland, munition factories came into existence. In the naval warfare, the E. coast of Scotland was of great strategic importance.

Apart from the war and its effects, the ten years witnessed few important internal events or movements. Trade and com-

merce were frequently interrupted by strikes, but the only serious riots took place in Glasgow on Jan. 31 1919, when considerable damage was done to buildings. Political interests, before the war, pursued their traditional course, and in the general election of Dec. 1910, Scotland returned 58 Liberal, 11 Unionist, and 3 Labour or Socialist members. By the date of the Armistice, party politics had undergone a complete transformation, and, at the general election of Dec. 1918, Scotland, which by the Reform Act of 1918 received two additional members, returned 58 supporters of the Coalition, 7 Independent Liberals, 7 Labour representatives and 2 Independents. A feature of the period has been the large number of state visits paid by King George and Queen Mary. An Accession Court was held at Holyrood in June 1910, and, a year later, the King dedicated the new chapel of the Thistle in St. Giles's cathedral, Edinburgh. Royal visits to Edinburgh, Glasgow, Dundee, Perth and Stirling took place in July 1914. During the war, the King paid some private visits to centres of munition industries, and the programme of state visits was resumed in July 1920, when the King and Queen held a Court at Holyrood, and in their yachts visited the Clyde during the regatta known as the "Clyde Fortnight."

In church affairs, the most important events have been the issue in 1910 of the final Report of the Royal Commission appointed under the Churches (Scotland) Act of 1905, allocating the property of the old Free Church between the United Free Church and the Free Church, and the series of negotiations for union between the Church of Scotland and the United Free Church, which became a matter of practical politics after the discussions in the Assemblies of 1912 and had advanced so far by 1919 that, on Dec. 17, the commission of the Assembly of the Church of Scotland agreed to approach the Government with a view to carrying a bill through Parliament.

The recent growth of a keener appreciation of the value of historical records and monuments is illustrated by the enactment in 1913 of the Ancient Monuments Consolidation and Amendment Act, by the work done by the Royal Commission on Ancient Monuments, originally appointed in 1908, and by the gift of four great historical buildings to the nation. In 1918, Lord Glenconner presented Dryburgh Abbey to the nation, and in the same year the Duke of Buccleuch followed his example by the gift of Melrose Abbey. In 1919, the Duke of Roxburghe made an arrangement with the Commissioners of Public Works and Buildings by which Kelso Abbey became a national monument and is maintained by the State, and in 1920 Col. Hall Dempster placed Restenneth Priory (Forfarshire) in the charge of the Commissioners of Works for national guardianship and for the benefit of the nation. On the other hand, by an outrage attributed to suffragettes, Scotland lost on Feb. 26 1914 the church of Whitekirk (Haddingtonshire), one of the few beautiful pre-Reformation churches surviving.

Two important centenary celebrations took place in the period—the quin-centenary of the foundation of the university of St. Andrews, held in 1911, when Lord Rosebery was installed as Lord Rector and made a famous oration, and the sex-centenary of the victory of Bannockburn (June 24 1314), which was celebrated by a procession and a banquet at Stirling on June 27 1914, when Sir George Douglas delivered the address. The town council of Aberdeen commemorated the quin-centenary of the battle of Harlaw, fought in 1411, and the town council of Arbroath, in Sept. 1920, held a patriotic and religious service to celebrate the sex-centenary of a famous assertion of the independence of Scotland in a letter addressed to the Pope by a Parliament which met in the abbey at Arbroath in 1320.

More practical evidence of renewed interest in Scottish history was given by the success of the Scottish Historical Exhibition at Glasgow, opened by the Duke of Connaught in May 1911, the proceeds of which formed the main endowment of a Chair of Scottish History and Literature founded in the university of Glasgow in 1913.

The demand for some form of Scottish Home Rule has been insistently pressed by its advocates since 1910 but there has been no evidence of any wide-spread feeling on the topic, apart

* These figures indicate the volume and page number of the previous article.

from the more general question of the adoption of a system of Devolution for the United Kingdom, a suggestion which received much parliamentary support in the years 1918-20.

Apart from the extensions of Edinburgh and Glasgow, the most important municipal event is the amalgamation, in 1920, of Motherwell (about 42,860 inhabitants) with Wishaw (about 27,484 inhabitants) to form a single municipality known as Motherwell and Wishaw.

Legislation.—In addition to the emergency war legislation which affected Scotland equally with England the decade 1911-20 was marked by a series of important legislative enactments, intimately affecting the political and social life of the country. A vast change was made in the parliamentary electorate by the Representation of the People Act of 1918, which increased the number of voters (counties, burghs and universities) from 800,448 at the general election of Dec. 1910, to 2,211,178 at the general election held in Dec. 1918. The Fourth Reform Act (1918) not only made a wide extension of the franchise; it also, by its redistribution of the constituencies, severed the last link with the old tradition of Scottish parliamentary representation as it existed before the union. The shire ceased to be the unit of county representation, and the old Scottish system of separate burghal representation was abandoned. The burgesses had sat in the Scottish Parliament, as a separate estate, from a much earlier period than the commissioners of shires, and the royal burghs, which they represented, had special trading privileges which distinguished their interests from those of the counties in which they were situated. The principle, adopted in 1707, of grouping together small burghs, sometimes geographically distant, as separate constituencies, was retained in 1832, 1868 and 1885; e.g. the inland burgh of Elgin voted with the distant seaport of Peterhead, instead of forming part of the constituency of Morayshire. In 1918 the burgh of Perth, which had enjoyed separate representation, and eight groups or districts of burghs were merged in county constituencies; six districts of burghs still exist, but the constituent members of each group are in close geographical proximity. The last vestiges of the privileges of royal burghs, in which the distinctively Scottish system of distribution originated, had been removed as long ago as 1846.

The other important Acts of the period may be described as social legislation, dealing with housing and provision for medical attendance, land questions, temperance and education. An Act of 1909 had extended to Scotland the Housing of Working Classes Acts, 1900-3, with certain modifications, and had given powers to local authorities, with the consent of the Scottish Local Government Board, for the compulsory acquirement of land; for the borrowing of money from the Public Works Loan Commissioners to provide working-class dwelling-houses; and for the execution of town-planning schemes. The shortage of houses which became a serious social danger after the war, not only led to various emergency Acts limiting rents and mortgage interest and severely restricting the powers of landlords to terminate existing tenancies, but was also one of the causes of the creation of a Scottish Board of Health by an Act of 1919. The powers and duties of the Local Government Board for Scotland, and the Scottish Insurance Commissioners and also some powers of the Privy Council conferred by a large variety of recent Acts, were transferred to the Board of Health, which was entrusted with the execution of all measures conducive to the health of the people. A Housing (Scotland) Act of the same year (9 & 10 Geo. V., c. 60) gave to the new Board of Health the supervision of the schemes of local authorities for the provision of working-class dwellings, and empowered it, in the event of the failure of local authorities to prepare schemes, to make a public inquiry in any such locality and to arrange for the preparation of a scheme. The Act made provision for financial assistance (under the supervision of the Board of Health) to local authorities, public utility societies, and housing trusts, for the building of houses, largely increased the powers of local authorities as regards compulsory purchase, and made it compulsory for them to prepare town-planning schemes. Other measures affecting public health which were passed during the decade were the Highlands and Islands (Medical Service) Grant Act of 1913, which created an annual grant of £42,000 for the improvement of medical services and nursing in the Highlands and Islands; and the Midwives (Scotland) Act of 1915, which provided for the training and certification of midwives. The powers granted to the Privy Council under these two Acts are among those transferred to the Board of Health. The first Annual Report of the Board of Health (for the year 1919) showed that 212 housing schemes had been submitted by local authorities, providing for the erection of 112,573 houses, the total pop. represented by the authorities being 4,169,501. The report brought out the interesting point that, even in localities which are near stone quarries, the cost of building in stone exceeded, by a considerable sum, the cost of building in brick.

A very important measure dealing with land was passed in 1911. By the Small Landholders (Scotland) Act, the Scottish Land Court and the Board of Agriculture for Scotland were constituted, and the provisions of the earlier Crofters Acts were extended to other small landholders, and the Act was amended in various respects. A dignified

status was given to the Land Court by a provision that its chairman should enjoy the same rank and tenure of office as a judge of the Court of Session. The powers of the Board of Agriculture and Fisheries, under previous statutes, were distributed between the Board of Agriculture and the Board of Fisheries, and an Agricultural (Scotland) Fund was created for the establishment, enlargement and improvement of small holdings. Disputes between landlords and the Board of Agriculture are settled in the Land Court, which also determines the amount payable to landowners as compensation for permanent improvements, fixes rents in certain cases and prescribes regulations for pasture, grazing and common rights. The decisions of the Land Court are not subject to review by other courts, though the Court of Session may be consulted by the Land Court on questions of law. The first Report of the Land Court, for the nine months ending Dec. 31 1912, showed that 2,434 applications for small holdings had been received, and that 256 had been decided, the total rents, in these cases, being reduced from £2,226 16s. to £1,568 2s. and arrears of rent amounting to £1,721 14s. being reduced to £771 10s. In 1919, "fair rents" were fixed for 170 holdings, the average reduction of rent being 10%, and 275 holdings were re-valued, at the expiry of seven years from the fixing of a "fair rent"; the original rents of these holdings amounted to £2,823, the first "fair rents" to £1,927, and the rents fixed in 1919 to £2,058, representing an increase of over 6½% on the previous decisions—an indication of the improvement in the value of land. Further provision for the acquisition of land for the purposes of small holdings was made by the Land Settlement (Scotland) Act of 1919 (9 & 10 Geo. V., c. 97), which also amended the Small Landowners Act of 1911. Fresh powers were given to the Board of Agriculture by the removal of restrictions as to total area to be acquired and as to methods of purchasing or taking land on lease or feu, and by widening the range of its activities. A large series of statutes for crofts and small holdings is now in operation, and the Land Court in its 1919 Report drew attention to the urgent necessity for their codification in order to remove ambiguities, inconsistencies, and difficulties of interpretation. Less important measures dealing with land were the Feudal Casualties Act of 1914, for providing for the redemption of duplications and grassums (entry fees) and other sums payable by feu-holders to their superiors at intervals of more than a year; the Entail (Scotland) Act of 1914 restricting the possibilities of future entails of land or property; and the Duplications of Feuduties (Scotland) Act of 1920, passed to reverse the effect of a decision of the House of Lords in 1919 that a "duplicand" payment of a feuduty means, unless otherwise defined in a deed, the payment of double the regular feuduty in addition to the ordinary annual payment. The Act defines a duplicand, in accordance with what has been the traditional usage, as "one year's feuduty only over and above the feuduty for the year." The prevalence of the system of feus in Scotland rendered the legal decision a matter of considerable importance.

Liquor Licensing.—The Temperance Act (Scotland) 1913 provided that, on the Act's coming into force in June 1920, local authorities should, on the receipt of signed requisitions from electors in their areas, take a poll on three alternative resolutions dealing with the number of licenses in an area. The resolutions were (1) that there should be no change in the system of licensing, (2) that the licensing court should grant not more than 75% of the licenses previously in force and (3) that no license should be granted within the area, except, in special circumstances, to *bona fide* hotel and restaurant keepers, who might be allowed to sell drink in retail to residents in hotels or to persons taking meals at restaurants. The areas were defined as burghs of a pop. not exceeding 25,000; separate wards in larger burghs; and parishes in the counties. The voters were defined as electors to town councils in burghs and electors to parish councils in the counties. Each voter could vote for only one resolution, but, where a no-license resolution was not carried, the votes given for no-license were to be added to the votes given for limitation of licenses. A no-license resolution was to require 55% of the recorded votes in a poll of not less than 35% of the electors, in order to be carried; a limitation resolution required a bare majority vote in a poll of the same size. Polls were held in Nov. and Dec. 1920, in 580 out of 1,221 polling areas; of the remainder, about 300 were areas in which no license existed, and in the rest no requisitions were submitted for a poll. The polls took place in all the towns and in the more thickly populated rural districts. Five hundred and nine areas voted for no change, 33 for limitation of licenses, and 40 for no license. The total numbers of votes were:—708,727 (60%) for no change; 19,400 (1.6%) for limitation; and 453,728 (38.4%) for no license. In Glasgow, four wards (Camphill, Cathcart, Pollokshields and Whiteinch) voted for no license, and nine wards for limitation; in Edinburgh, Dundee and Aberdeen no change was carried in every ward. There were in Nov. 1920, 9,371 licensed premises in Scotland, of which 1,471 were hotels or inns, 4,847 were public-houses and 3,053 were grocers' shops. The reduction made in May 1921, in accordance with the result of the polls, involved the extinction of about 450 licenses, a majority being in urban areas, where middle-class residential districts voted for the abolition or reduction of licenses. Glasgow contributed 99 to the total number of withdrawals of licenses, but these were chiefly in the residential districts already named or in other residential districts like Govanhill, Kelvin-side, Park and Pollokshaws, in which there was an unusually

garded as mistaken even by many of his closest followers, who were inclining to believe that in forfeiting the vital factor of personal leadership the loss was greater than could be compensated for by any amount of intensification of expert knowledge. There was a growing tendency too, to concentrate study and standardization on the inanimate side of industry, on machines, tools and equipment, on materials and their treatment, on handling methods and appliances, on labour-saving devices, rather than on speeding up and regulating the motions of the worker. The same distinction was seen in the attitude of British labour leaders to Scientific Management. Among the more intellectual leaders the accumulation of more and more of the technical knowledge of an industry in the hands of the management and the more detailed regulation and instruction of the manual worker which results were recognized as inevitable. They were seen to be merely a continuation of the process of replacing hand labour and hand skill by machinery. Such men accepted the need for the application of science to industry as far as the inanimate factors were concerned, and concentrated their antagonism against the treatment of the worker as mere impersonal mechanism.

By the end of the World War some 100-200 American undertakings, largely engineering concerns, had adopted Scientific Management in one or another of its forms, as a complete system. In Great Britain the number of such firms was perhaps one-tenth of those in America, and the positions in France and Germany were perhaps less advanced still. The influence of the movement, however, cannot be estimated by any such figures. For every concern that had adopted the system in its entirety there were 10 or 20 that had adopted portions of it, or had modified their previous methods of management under the influence of ideas first given prominence by the Scientific Management school. The conception of "the one best way," the belief that every act, every relation and every implement of industry is worthy of close and systematic study, has provided an inspiration and a stimulus to management methods in all industries and in every country, the effect of which can hardly be less than that of the introduction into industry of machinery a hundred years ago. (C. G. R.)

SCOTLAND (see 24.412*).—The history of Scotland from 1910 to 1921 resolves itself largely into the effect of the World War (1914-9) and of the conclusion of peace upon industry and commerce. In the history of actual military operations, Scotland played, naturally, a small part, although for the first time in the history of Great Britain as a sea-power, the main activities of the fleet took place in Scottish waters. Zeppelins attacked Edinburgh and the E. coast on April 2 1916. On May 2, in the course of a raid which was upon an unusually large scale, but had very slight results, a Zeppelin (Lao) missed Edinburgh and sailed as far N. as Aberdeenshire, where it dropped bombs which fell harmlessly on fields. Another fruitless expedition to the S.E. of Scotland took place on Aug. 9 1916; the raiders got into thick weather and their bombs were dropped in rural areas. On May 15 1918, St. Kilda was bombarded by a German submarine and damage was done to the church and some other buildings. The surrender of the German fleet is the only other operation definitely associated with Scotland. German naval emissaries arrived in the Firth of Forth on Nov. 15 1918, and the surrender began on Nov. 21. It was in Scapa Flow that the crews of 70 German warships scuttled their ships on June 21 1919.

The part played by Scotland in supplying man-power and in providing munitions of war was worthy of the national tradition. The Scottish recruiting record in the period preceding the introduction of compulsory service will compare with that of any other portion of the United Kingdom, and Scottish industries, like those of England and Wales, were directed to the production of war material. The Clyde, naturally, took a large part in naval construction and repairs, and all over Scotland, munition factories came into existence. In the naval warfare, the E. coast of Scotland was of great strategic importance.

Apart from the war and its effects, the ten years witnessed few important internal events or movements. Trade and com-

merce were frequently interrupted by strikes, but the only serious riots took place in Glasgow on Jan. 31 1919, when considerable damage was done to buildings. Political interests, before the war, pursued their traditional course, and in the general election of Dec. 1910, Scotland returned 58 Liberal, 11 Unionist, and 3 Labour or Socialist members. By the date of the Armistice, party politics had undergone a complete transformation, and, at the general election of Dec. 1918, Scotland, which by the Reform Act of 1918 received two additional members, returned 58 supporters of the Coalition, 7 Independent Liberals, 7 Labour representatives and 2 Independents. A feature of the period has been the large number of state visits paid by King George and Queen Mary. An Accession Court was held at Holyrood in June 1910, and, a year later, the King dedicated the new chapel of the Thistle in St. Giles's cathedral, Edinburgh. Royal visits to Edinburgh, Glasgow, Dundee, Perth and Stirling took place in July 1914. During the war, the King paid some private visits to centres of munition industries, and the programme of state visits was resumed in July 1920, when the King and Queen held a Court at Holyrood, and in their yachts visited the Clyde during the regatta known as the "Clyde Fortnight."

In church affairs, the most important events have been the issue in 1910 of the final Report of the Royal Commission appointed under the Churches (Scotland) Act of 1905, allocating the property of the old Free Church between the United Free Church and the Free Church, and the series of negotiations for union between the Church of Scotland and the United Free Church, which became a matter of practical politics after the discussions in the Assemblies of 1912 and had advanced so far by 1919 that, on Dec. 17, the commission of the Assembly of the Church of Scotland agreed to approach the Government with a view to carrying a bill through Parliament.

The recent growth of a keener appreciation of the value of historical records and monuments is illustrated by the enactment in 1913 of the Ancient Monuments Consolidation and Amendment Act, by the work done by the Royal Commission on Ancient Monuments, originally appointed in 1908, and by the gift of four great historical buildings to the nation. In 1918, Lord Glenconner presented Dryburgh Abbey to the nation, and in the same year the Duke of Buccleuch followed his example by the gift of Melrose Abbey. In 1919, the Duke of Roxburghe made an arrangement with the Commissioners of Public Works and Buildings by which Kelso Abbey became a national monument and is maintained by the State, and in 1920 Col. Hall Dempster placed Restenneth Priory (Forfarshire) in the charge of the Commissioners of Works for national guardianship and for the benefit of the nation. On the other hand, by an outrage attributed to suffragettes, Scotland lost on Feb. 26 1914 the church of Whitekirk (Haddingtonshire), one of the few beautiful pre-Reformation churches surviving.

Two important centenary celebrations took place in the period—the quin-centenary of the foundation of the university of St. Andrews, held in 1911, when Lord Rosebery was installed as Lord Rector and made a famous oration, and the sex-centenary of the victory of Bannockburn (June 24 1314), which was celebrated by a procession and a banquet at Stirling on June 27 1914, when Sir George Douglas delivered the address. The town council of Aberdeen commemorated the quin-centenary of the battle of Harlaw, fought in 1411, and the town council of Arbroath, in Sept. 1920, held a patriotic and religious service to celebrate the sex-centenary of a famous assertion of the independence of Scotland in a letter addressed to the Pope by a Parliament which met in the abbey at Arbroath in 1320.

More practical evidence of renewed interest in Scottish history was given by the success of the Scottish Historical Exhibition at Glasgow, opened by the Duke of Connaught in May 1911, the proceeds of which formed the main endowment of a Chair of Scottish History and Literature founded in the university of Glasgow in 1913.

The demand for some form of Scottish Home Rule has been insistently pressed by its advocates since 1910 but there has been no evidence of any wide-spread feeling on the topic, apart

* These figures indicate the volume and page number of the previous article.

department in 1917 and 1918. The totals (including naval construction) for the five war years were:—

	Vessels	Tonnage	I.H.P.
1914	481	591,396	1,192,347
1915	386	331,410	1,231,043
1916	477	541,527	1,898,044
1917	517	502,875	1,628,950
1918	585	613,709	1,958,944

In no one of the war years did the tonnage approach that of 1913, but this is explained by the circumstance that the proportion of tonnage to I.H.P. is much smaller in naval than in mercantile construction, and the 1913 I.H.P. figures were exceeded in every year of the war. In the war years, the volume of naval repairs was also very great.

In 1919 the tonnage figures of Scottish yards rose to 729,490 with I.H.P. 1,590,894, and in 1920 to 778,914, with I.H.P. 673,040; the figures relate entirely to mercantile shipping, as naval construction was stopped. The increase of tonnage over 1918 was in the building of many cargo steamers, the average size of which was greater than before the war, and the decrease in new machinery indicated in the I.H.P. figures is explained by the circumstances that such steamers are of comparatively low power. Judged by the test of tonnage, the output for 1920 was not far below that of 1913, although the machinery installed was not much more than half; compared with the purely mercantile output of 1913, both the tonnage and the I.H.P. figures were larger in 1920, and the year ranked as second only to 1913, but the prospects for the future were very poor.

Shipping.—The year 1911 was marked by a rise in freights which continued throughout 1912 and the first half of 1913, but in the end of that year there was something like a collapse, and the "slump" continued until the outbreak of war, when a temporary suspension of chartering was followed by a very sharp rise in freights which continued, progressively until Government control began, in 1917. A further rise took place at the beginning of 1918 in order to cover Government liability for losses in tonnage through sinkings. The reorganization of Scottish shipping, after the interruption of the war, did not make much progress until the latter half of 1919, owing to the necessities of demobilization; and the process of reorganization was hampered in 1920 by labour troubles and especially by the uncertainty of the export coal trade. Freights continued to be high in the early part of the year, but even high rates proved to be unprofitable in view of the cost of coal and of labour and rises in harbour tolls, stevedoring, and insurance premiums; and in the end of the year there was a "slump" in freights. The effect of the war may be traced in the decrease in the total number of vessels registered in Scottish ports. In 1914 there were 494 sailing vessels, with net tonnage 153,323 and 3,441 steam vessels with net tonnage 2,675,720—a total of 3,935 vessels with net tonnage 2,829,043. In 1918 there were 354 sailing vessels with net tonnage 82,181 and 2,759 steam vessels with net tonnage 1,797,907—a total of 3,113 vessels with net tonnage 1,880,088, the decrease in tonnage being constant and progressive until 1918, in which year there was a check to the rate of the downward movement. The decrease in net tonnage registered in Scottish ports was 172,134 in 1915, 232,994 in 1916, 389,183 in 1917 and 154,644 in 1918, the figures in each case representing the decrease on those of the previous year. Statistics showing the recovery in 1919 and 1920 were not available in Feb. 1921. The following table shows the effects of the war and of the first year of peace upon the imports and exports of merchandise at Scottish ports:—

	1911	1915	1917	1918	1919
Imports in £	46,937,758	58,442,334	76,970,468	109,343,866	112,631,887
British and Irish Exports	46,683,953	38,242,899	44,048,744	32,333,700	69,661,877
Foreign and Colonial Exports	677,301	1,442,711	1,025,380	526,349	6,146,906
Total in £	94,299,012	98,127,944	122,044,592	142,203,915	188,440,670

Coal.—The table at the foot of the page shows the output of Scottish coal in the decade.

The export trade before the war amounted in round numbers to 16,000,000 tons per annum, of which 6,500,000 represented bunker coal and coal shipped to home ports. The outbreak of war at once closed markets in Germany, Austria, Russia, and Turkey, and interrupted trade with other countries. The effect was specially felt in

the E. of Scotland, which is largely dependent on overseas trade. Exports further decreased from 1915 to 1917. In 1918 they amounted to 7,460,000 tons, or about 45% of the pre-war average, but, in the end of that year, shipments to foreign countries were almost entirely suspended, owing to the demand for bunker coal and for coal for Admiralty and home use. Exports were specially low in the Forth area because the ports of Bo'ness, Grangemouth, Granton, and Bursialand were largely or entirely requisitioned by the Admiralty. In 1920 the coal controller, to safeguard an expanding home demand, placed very severe restrictions upon exports; and Scottish exports, in the first ten months of that year, amounted to 1,156,475 tons as compared with 2,129,059 tons in the first ten months of 1919; these figures are exclusive of bunker coal. Total output was reduced by strikes in 1912 and in 1920, and, during the war, by shortage of labour. Prices were low at the beginning of 1911 and fell in the first half of the year, but, by the beginning of 1912, they showed an advance of from 1s. to 2s. per ton in all classes of fuel. Prices remained high in 1912 and rose in 1913; they varied at different periods in 1914, and the advance of recent years began in 1915, although there were remarkable fluctuations in 1916. Maximum retail prices were fixed for home consumption in 1917. After the Armistice, prices advanced rapidly in the second half of 1919, and the supply was unequal to the demand. Export prices reached an unprecedented level in 1920, but the beginning of 1921 witnessed a "slump" in exports. Before the war, the Scottish coal trade had to face German competition. At one time, Germany was an important market for Scottish coal, but exports to Germany had fallen to under 3,000,000 tons, and German coal was competing with Scottish coal in foreign markets. New markets were, however, being opened up, and from 1911-4 Fife coal was developing large exports to S. America. A new dock at Methil, built principally for this trade by the North British Railway Co. (at a cost of nearly £1,000,000), was opened in 1913.

Iron and Steel.—In spite of a temporary decline in the price of hematite pig-iron and steel scrap in 1911, the decade opened well for the steel and iron trades. There was an increase in steel exports in 1911 and it was maintained, in spite of the coal strike, in 1912, and in the first half of 1913; but German competition was severely felt both in home and in Japanese, Canadian and Indian markets. In 1914 both the pig-iron trade and the steel trade were inactive, but a rapid improvement followed the outbreak of war, and steel and malleable iron continued to be in great demand throughout the war. The pig-iron market, on the other hand, suffered in 1915 from an unprecedented advance in the price of ore and from freight difficulties. Early in 1916 all the works in which pig-iron was produced were placed under the Ministry of Munitions, and there was a steady demand in spite of reduced exports. The pressure of work in the steel and iron trades continued after the decontrol of steel in Jan. 1919 and of iron in the following April, and prices were high. In the end of the year steel ship-plates were £19 15s., boiler ship-plates £24 10s., and angles £19 5s., net per ton delivered on the Clyde, as compared with £7 2s. 6d., £7 17s. 6d., and £6 15s., respectively, the highest prices in 1911. Hematite iron rose to 210s. per ton as compared with 72s., the highest price in 1911. Prices reached still higher levels in 1920, demand far exceeding supply in the earlier part of the year, but prices proved to be too high for remunerative trade, and reductions were made in November. Imports of pig-iron from France and Belgium were begun, but in quantities so small that competition with Scottish production had not yet become serious.

Mineral Oil.—The Scottish mineral oil trade, the centre of which is W. Lothian, was suffering severely from foreign competition in the

years immediately preceding the war. Low prices and decreased dividends marked the year 1911; there was a revival in 1912, due partly to the general "boom" in trade and partly to the opening up of wider markets, and 1913 was also prosperous in spite of the growing competition of the Mexican oilfields. Production remained about the average of over 3,000,000 tons of shale in 1914, but prices fluctuated, and exports decreased from 324,704 tons of oil in 1913 to

	No. of mines at work under Coal Mines Act	No. of persons employed	No. of tons of coal produced
1911	518	138,377	41,718,163
1912	520	143,302	39,518,629
1913	542	147,549	42,456,516
1914	547	146,168	38,847,362
1915	535	121,854	35,596,856
1916	537	127,104	36,193,000
1917	522	130,027	38,569,964
1918	522	124,475	31,890,218
1919	512	144,286	32,457,864

The estimated output for 1920 was 31,000,000 tons

311,000 tons. Prices were maintained at a high level throughout the war, and the demand was steady, but, at the beginning of 1919, the largely increased cost of production rendered it very doubtful if the industry (which was estimated to employ directly about 10,000 workpeople and indirectly probably about 50,000) could be continued on a remunerative basis. The problem was solved by an offer from the Anglo-Persian Oil Co. to form a new consolidated company known as Scottish Oils Ltd.; its acceptance by the shareholders of the Scottish companies allied the Scottish oil trade with a strong group of oil interests under one central management, and the result has been satisfactory, although demand decreased in the end of 1920 owing to the general uncertainty of trade conditions.

Textiles.—The woollen trade in the Borders had a year of great prosperity in 1911, the output and the export trade (especially with Germany) being very great. Thread and yarn makers had also a prosperous year, and the linen trade of Dunfermline was steady, though not brisk, but the jute trade of Dundee passed through one of its worst years, with unprecedented curtailment of production, due chiefly to over-production in Calcutta. The following year saw a remarkable revival in the jute industry, which enjoyed a period of unparalleled success, the woollen trade continued to be prosperous and conditions in the linen trade were normal. Prosperity in textile industries continued through 1913 and was not checked until the outbreak of war, when the export of tweeds and linen came suddenly to an end, and the textile industries as a whole suffered from a decrease in the purchase of luxuries and from the cessation of imports of raw material. Jute, which had been prosperous in the early part of the year, became unremunerative towards its close. New outlets were found in the manufacture of khaki cloths, flannel shirtings, and military blankets, but reorganization took time and was delayed by lack of dyes and by the circumstance that Scottish flannel was largely made from Belgian raw materials. Throughout the war, the Dunfermline linen trade suffered more severely than other textiles, the looms being unsuitable for the goods which were required. The jute trade recovered in 1915, largely owing to Government orders. These conditions continued to the end of the war; prices, in spite of Government control, were very high, and rose after the Armistice. The year 1919 was very prosperous for the jute trade, and linen made a considerable recovery, in spite of difficulties about raw material, but the woollen trade suffered from a poor clip after a severe winter and a late spring. The general prosperity in textile trades continued into the first quarter of 1920, but was followed by an almost complete cessation of demand for woollen and linen goods, and similar conditions prevailed in the jute trade. All over, prices, as determined by cost of production, were too high for the consumer.

Agriculture.—Agricultural conditions have undergone a large number of changes. In 1910, agriculture was an unprofitable occupation for the tenant, and rents were low—on the average, about half what they were in the 'eighties. Agricultural wages were also comparatively low, although they had recently advanced, and the average weekly earnings for all classes of agricultural labourers were higher in Scotland than in England. Farmers were feeling the burden of foreign competition and of the expense of the machinery necessary for scientific farming. The food problem during the war gave a new impetus to agriculture, the effect of which may be seen from the following table:—

	Area under:—			
	Crops and grass acres	Arable land acres	Permanent grass acres	Corn crops acres
1911	4,845,835	3,348,568	1,497,267	1,218,055
1914	4,786,179	3,295,040	1,491,139	1,186,432
1915	4,781,416	3,290,543	1,490,873	1,220,307
1916	4,775,525	3,303,180	1,472,345	1,234,748
1917	4,776,200	3,360,342	1,415,858	1,273,549
1918	4,761,101	3,453,494	1,307,607	1,493,169
1919	4,751,475	3,408,479	1,342,996	1,378,318

The largest increase in production was in the years 1917 and 1918. In 1917, the total produce of wheat was 304,169 quarters (an increase of 21,000 quarters over 1916) and in 1918 it rose to 402,000 quarters. The figures for barley and bere are 704,788 quarters in 1917 (an increase of 57,600 quarters over 1916) and 677,000 in 1918; and for oats 5,446,931 quarters in 1917 and 6,457,000 in 1918. The total produce of the potato crop was 1,110,085 tons in 1917 (an increase of 579,000 tons on 1916) and 1,151,000 tons in 1918. Live stock showed similar variations; the number of horses rose from 206,474 in 1911 and 198,704 in 1915 to 207,113 in 1916 and 210,048 in 1917, falling slightly in 1918. Numbers of sheep and pigs declined slightly in the war years—sheep from 7,164,342 in 1911 to 6,878,198 in 1918, and pigs from 171,115 in 1911 to 128,007 in 1918, but cattle rose from 1,200,017 in 1911 to 1,225,330 in 1916 (1,209,842 in 1918).

The increases in corn crops and potatoes were the result not only of economic conditions, such as rising prices, but also of administrative and legislative measures. In the summer of 1915 the Secretary for Scotland appointed a departmental committee to report on the measures necessary to increase the production of food during the war; in 1916, the attention of military tribunals was directed to

agricultural necessities, and the army lent military labour at certain seasons of the year. The Corn Production Act of 1917 led to the division of Scotland into districts with District Wages Committees to fix wages. The general prosperity of agriculture is shown by the rise in *Fiars Prices*—average prices ascertained annually by an inquiry held by the sheriff of a county in order to fix the amounts payable to parish ministers for each kind of grain. The prices vary considerably in different counties, but the value of all sorts of grain and of oatmeal was doubled or trebled between 1911 and 1918, and remained at its high level through 1919 with a slight decline in 1920. The wages of agricultural labourers increased proportionally, and their standard of living rose, giving impetus to a tendency notable before the war, to abandon the traditional brose and porridge in favor of more expensive foods and especially butcher's meat. A result of agricultural prosperity was a very large number of sales of land in 1919 and 1920. Scotland, to a large extent, ceased to be a country of huge estates, and the number of farmers who farm their own lands greatly increased.

Forestry.—Before the war, there was a revival of interest in forestry, due to the exertions of several Scottish landlords, and to the action of the Board of Agriculture and the Development Commission. In 1912, a departmental committee, appointed to select a suitable locality for a demonstration forest area, issued an elaborate report on steps for the promotion of silviculture, some of their suggestions being adopted by the Development Commission in 1913. These developments were interrupted by the war, for scarcity of labour put an end to afforestation, and the extensive demand for timber brought about a depletion of woodland areas from 1915 onwards. It was estimated in 1916 that more than half of a home production of 40,000,000 cubic ft. of timber had come from Scottish forests. The depletion of woodlands was continued owing to the demand for timber for purposes of reconstruction in 1919 and 1920, and in June of the latter year there was a series of destructive forest fires in Ross-shire, Inverness-shire and Aberdeenshire. In 1919, a Forestry Act, passed for the United Kingdom, transferred to the Forestry Commission the powers in this respect of the Board of Agriculture for Scotland. The Commission had acquired, by the end of 1920, about 60,000 ac., of which about half was plantable.

Fisheries.—The character of the Scottish fishing industry was already undergoing an important development by the year 1910. It was ceasing to be conducted by small fishing boats, owned by the fishermen who used them, and was passing into the hands of large companies whose capital provided the necessary fleets of steam drifters. The capitalization of the industry was extending to salmon fisheries, which were being bought up by wealthy companies. These conditions have persisted even in the Highlands and Islands, where the combination of fishing with the cultivation of crofts became much less common. In 1910, the Scottish fishing fleet consisted of 9,724 vessels, valued at £4,409,027, of which 1,073 (valued at £2,437,586) were propelled by steam; in 1919, there were 6,534 fishing vessels, valued at £7,198,431, of which 3,722 were sailing or rowing boats; the remainder consisted of 294 steam trawlers (valued at £3,342,255), 767 steam drifters, and 1,751 auxiliary motors. The number of boats which possessed auxiliary motors in 1910 was 156. Between 1910 and 1919, the number of sailing and rowing boats decreased from 8,175 to 3,722, and the estimated value from £642,902 to £122,823. The sailing and rowing boats were manned by 25,985 men and boys in 1910, and by 9,830 in 1919; the total number of men and boys employed as crews decreased from 38,941 in 1910 to 27,408 in 1919. The increase of motor vessels in the western area was a notable feature of the period. In 1910, 40 motor vessels belonged to Campbeltown and 11 to Ballantrae, and 23 to other W. coast fishing ports; in 1919, the numbers at Campbeltown and Ballantrae had increased to 78 and 88 respectively and there were 209 belonging to other ports, of which Loch Carron and Skye possessed 80 (as compared with 4 in 1910) and Inverary 70 (as compared with 8 in 1910). Stornoway, where there were no mechanically propelled vessels in 1910, had 18 steam liners and drifters and 13 motor-boats in 1919. The steam trawlers were still, in 1919, confined to Leith, Montrose, Aberdeen (which possessed 193 out of 294), and Peterhead, except for 8 belonging to Greenock. The large use of motor-boats was partly a result of the diversion of steam drifters to other purposes during the war, and the demand for them decreased in 1919, when steam drifters again became available. In the course of the war, 302 trawlers, 829 drifters, and 133 motor-boats (a total of 1,264 fishing vessels) were requisitioned by the Admiralty, chiefly as naval auxiliaries. Of these, about 100 were lost while on war service; of the remainder, all except 131 were released in 1919 and most of them had been re-conditioned and were again engaged in the fishing industry by the end of that year. The number of Scottish fishing vessels sunk while engaged in fishing in the course of the war was 96, of which 51 were trawlers. In June 1915, no fewer than 34 vessels were lost, and the experience of that month led to the enforcement of very severe restrictions upon the fishing industry. The effect of war restrictions is evident from the total quantities of fish (exclusive of shell-fish) landed in Scotland in successive years by Scottish vessels:—1913, 7,267,328 cwts.; 1914, 6,926,241 cwts.; 1915, 2,319,390 cwts.; 1916, 3,412,030 cwts.; 1917, 3,079,768 cwts.; and 1918, 3,313,228 cwts. In 1919, the quantity rose to 5,968,866 cwts. The value of the catch naturally rose in proportion to scarcity; the value of over 7½ million

cwts. in 1913 was £3,733,379; of about 2½ million cwts. in 1915, £2,051,171; and of over 3 million cwts. in 1917, £3,645,015. The most remarkable rise occurred in 1918, when about 3½ million cwts. were valued at £5,991,693. In a week of Jan. of that year, the average price of all white fish sold in Aberdeen was £7 9s. 2d. per cwt. Maximum prices were fixed, but they had necessarily to be fixed at a high level in view of scarcity of labour and the special dangers attaching to fishing industry. In 1919, the increase in quantity over 1918 was 80%, but the value was £6,063,739—an increase of only a little above 1%, as compared with 1918; but the average price in 1919 was about double that of 1910, and prices remained high through 1920. The stress of the outbreak of war was felt specially heavily by the herring industry, for the chief markets for cured herrings were in continental Europe and communication was cut off. There was a large existing stock of unsold herrings, and great quantities had been sent to German ports. As the war progressed, decreased production and increased home demand led to a great improvement, and exports were resumed—in 1916, 366,682 barrels of herring were exported (as compared with 1,385,323 barrels in 1913), and 113,284 barrels in 1917—so that 1914 was the only disastrous war year. Increased production in 1919 brought about a difficult situation, for political and economic conditions in Russia and in Central Europe prevented the resumption of trade, and the industry was saved from disaster by a Government guarantee, which was renewed for 1920, but was refused for 1921, which opened with very gloomy prospects for the herring fishing industry. A committee of the Fishery Board recommended in 1919 that whaling operations should be prohibited in any part of Shetland, on the ground that the decline of the herring fishing in Shetland is directly connected with the introduction and development of whaling, an industry carried on almost entirely by foreigners.

Railways and Transport.—No new railways have been constructed since 1911, and the whole railway conditions have been abnormal since 1914. Serious railway accidents during the decade include a collision at Burntisland on April 14 1914, in which two railway employees were killed; collapse of a culvert near Carrbridge on June 18 1914, involving a disaster to a train and the deaths of five passengers by drowning; and an accident at Ratho on Jan. 3 1917 resulting in 12 deaths. The gravest railway disaster occurred to a troop train at Quintin's Hill, near Gretna, on May 22 1915, when 227 of the 7th Royal Scots were killed and 246 were injured. The accident occurred through the carelessness of two signalmen, both of whom received sentences of imprisonment. There has been a large increase in motor transport, but agriculture, fishing, mining and commerce are still handicapped by the lack of transport facilities. The proportion of mileage of railway to pop. is much smaller in Scotland than in such a small maritime country as Sweden, the number of miles of railway per 10,000 pop. being 16.2 in Sweden and 8.2 in Scotland. Transport conditions compare even more unfavourably with Belgium, which has a great system of canals, in addition to an elaborate system of railways, light railways and steam tramways. A committee on Rural Transport, appointed by the Secretary for Scotland, reported in 1919 that the construction of a considerable number of railways and light railways is essential for the development of the country, especially of inland straths and glens in various regions and of the W. coast and the islands. They gave illustrations of the results of lack of transport—the impossibility of growing early potatoes on soil specially suitable, the continued use of land for sheep farming which could be turned into good meadow land, the closing of a lead mine and the impracticability of working iron stone. In many districts, land could carry more stock and would be capable of closer settlement if better transport were available. The system of water transport could also be extended with advantage. Scottish canals fell largely into disuse after the introduction of railways, and some of them were acquired for the construction of their permanent way by railway companies. The total mileage of canals in Scotland is 183. There has been much discussion of the project of a reconstruction of the Forth and Clyde Canal, but without any result. The question of transport is closely associated with the utilization of water-power, several schemes for which are under consideration, the most important being schemes for the utilization of water-power in the districts of Lochaber and Fort William. In the large towns, there has been a great development of systems of electric tramways and motor omnibuses, and motor vehicles running in rural districts have proved formidable competitors to the railways.

Highlands and Islands.—The Board of Agriculture issued in 1913 a report on home industries in the Highlands and Islands by Prof. R. W. Scott, who pointed out that most of the existing home industries depend upon raw materials derived from the land—the hosiery and tweed industry using wool, and the basket industry, osiers, and that the encouragement of these industries must be closely connected with general agricultural policy. Shetland industries depend upon an improvement of the wool of Shetland sheep; in the Hebrides a deterioration in the quality of home-grown wool has led to large imports for Harris tweeds, while in Skye little has been done to encourage the cultivation of osiers. The report recommended the creation of local committees, under the authority of the Board, to supervise cottage industries, but the outbreak of war prevented the carrying out of the suggestions made. The home industries in existence in the Highlands and Islands in 1911 were hosiery, wool and worsted manufacture, basket-making, lace-making, silk-spinning,

shirt-making, umbrella manufacture, straw hats and bonnets manufacture, small ware and fancy goods, but only one person was reported as engaged in lace-making. The total number of workers in home industries was 5,649, about 500 of whom were males. An attempt by Lord Leverhulme to establish in Stornoway a large fish-curing and packing industry and to develop the whole resources of the island has been hampered by the seizure of land by returned soldiers, and the future of the project was in 1921 still uncertain. Lord Leverhulme's proposals included the construction at Stornoway of a fishing harbour superior to any existing harbour on the W. coast or in the western islands and the completion of a canning factory and of carding and spinning mills, the building of which was begun before the interruption of the execution of the scheme by the "raiding" of farms in the spring of 1920. The organization not only of the fishing industry but also of the Lewis and Harris hand-woven tweed industry was thus contemplated, along with the opening up of the common grazing lands in Lewis and Harris and the provision of some 3,000 allotments of a quarter of an acre in size, selected so as not to interfere with existing dairy or other farms.

The effects of the World War can readily be traced in Scotland of the present day. The efforts made, alike for the recruiting of the fighting armies, for the production of ships and munitions, and for the maintenance of food supplies, and generally, of the social and national organization, rendered those years the most strenuous period in the whole history of the country, and constitute a record of courage and endurance which cannot but leave its mark upon the national character. Like other portions of the Empire, Scotland has, since the end of 1918, suffered from the weariness produced by stupendous effort and from a consequent restlessness and impatience which has found vent in industrial disputes and in an eager adoption, by some of the youth, of new social ideals, in which the influence of Russian Bolshevik experiments and propaganda has been conspicuous. Such manifestations can be paralleled from other periods following the end of a great military struggle, and there is already evidence that the disturbances in organization and habit produced by the experiences of the war have reached their climax, and, with the restoration of commercial and industrial prosperity, will cease to operate adversely upon the peace of the country.

(R. S. R.)

SCOTT, CYRIL (1879–), English musical composer, pianist and author, born at Oxtou, Birkenhead, Sept. 27 1879, was musically educated at the Hoch conservatorium, Frankfurt A/M, chiefly under Ivan Knorr. While still in the pupil stage Scott heard his first symphony performed at Darmstadt in 1899. On Scott's return to England Hans Richter produced an orchestra suite by him at Liverpool. Subsequently Scott produced a vast amount of music, more especially of songs, most of which are on the same high level as that of the *Schumacherlieder* of his student days. Violin and pianoforte music also poured from his pen. A series of early overtures written for plays by Maeterlinck seem to have been suppressed, but there remain a Christmas overture, the two fine Passacaglias, the *Ballad of Fair Helen*, *La Belle Dame sans Merci*, and a pianoforte concerto and also two quintets, a piano quartet and a violin sonata. Scott also published several volumes of poems, including *The Voice of the Ancient* (1910); *The Vales of Unity* (1912); *The Celestial Aftermath* (1915) and the prose book *The Philosophy of Modernism* (1917). In 1920 his *Nativity Hymn* was accepted for publication by the Carnegie Trust, and in 1921 he paid a visit to the United States.

SCOTT, SIR JOHN EDWARD ARTHUR MURRAY, BART. (1847–1912), English art collector, was born at Boulogne Feb. 23 1847. The son of an English doctor at Boulogne, he became secretary to Sir Richard Wallace, heir of the 4th Marquess of Hertford. He helped Sir Richard to organize relief for the sufferers of the siege of Paris in 1870, and after the siege, to transport the treasures of the Hertford art collection from Paris to Bethnal Green museum. It was largely through his influence that Sir Richard Wallace's widow left the collection *en bloc* to the British nation, together with Hertford house, and he acted as chairman of the trustees' committee until his death. He became a trustee of the National Gallery in 1897, was created a baronet in 1899, and a K.C.B. in 1908. He died in London Jan. 17 1912.

SCOTT, ROBERT FALCON (1868–1912), English sailor and explorer, was born at Devonport June 6 1868, the son of John Edward Scott of Outlands, Devonport, and entered the navy in 1882. He was promoted lieutenant and appointed to the "Amphion" in 1889, and torpedo-lieutenant to the "Majestic" flagship of the Channel Squadron, 1898, becoming commander 1900. He commanded the National Antarctic expedition of 1901–4 (see 21.966) and in 1905 published his account of it in *The Voyage of the "Discovery."*

On his return he was promoted captain and commanded first the "Victorious," flagship of the Channel Squadron, and subsequently the "Essex" and the "Bulwark." He was awarded the gold medals of the Royal Geographical Society and of the Royal Scottish Geographical Society, and received medals from the geographical societies of many foreign countries, and an hon. degree from Cambridge. During part of 1909 he was naval assistant to the Second Sea Lord of the Admiralty, and in June 1910 he again set out for the Antarctic in the "Terra Nova" in command of a new expedition, financed partly by private individuals but aided by a Government grant. He arrived at Lyttelton, N.Z., in Oct. and reached McMurdo Sound at the end of the year. On Nov. 2 1911 he started on his journey of 850 m. to the Pole, accompanied all the way by Dr. E. A. Wilson, Capt. L. E. G. Oates, Lt. H. R. Bowers, and Petty-Officer Edgar Evans. He reached the Beardmore glacier on Dec. 10 and on Jan. 4 1913 left behind him his last supporting party in lat. 87° 32' S. When last heard of he was about 150 m. from the Pole, which his record shows that he reached Jan. 17 only to find Amundsen's tent and records left there one month earlier. On the return journey Evans fell (Feb. 17) in descending the Beardmore glacier and died shortly after. Blizzards were encountered and progress was slow. Food ran short, and on March 17 Oates went out alone to die. Three days later a fresh blizzard checked the survivors, whose supply of oil-fuel was exhausted and their food-supply very low. Scott's last entry in his diary was made on March 24. He was then only 11 m. from One Ton depot and a supply of food; but he was unable to reach it and died, with Wilson and Bowers, on or about March 27 1912.

A search party, sent out from the base in March 1912, had been driven back from One Ton depot by the weather, and it was recognized that there was no chance of Scott's party surviving the winter. Nothing further could be attempted until Oct., when search parties went out, and on Nov. 12 Dr. Atkinson and Mr. Wright found Scott's tent with the bodies of Scott, Bowers and Wilson and the valuable scientific records. Capt. Scott had a warm sympathy for scientific research and a good knowledge of many branches of science qualifying him for the leadership of an expedition, the main results of which were obtained by the labours of his scientific colleagues. The news of the disaster did not reach England until the survivors landed in N.Z. Feb. 10 1913. A memorial service, held in St. Paul's cathedral, London, Feb. 14, was attended by King George, and by royal warrant the rank and precedence of the wife of a K.C.B. were conferred on Capt. Scott's widow. A fund was raised as a memorial of Capt. Scott, from which ample provision was made for the surviving relatives of the lost explorers, and the balance was devoted to the promotion of polar research, a substantial amount being granted in 1911 towards the endowment of the Polar Research Institute of the Geographical department of the university of Cambridge.

On Sept. 2 1908, Scott had married Miss E. A. Kathleen Bruce, daughter of Canon Lloyd Bruce. Lady Scott had attained some reputation as a sculptor, and, later, executed statues of her husband, which have been erected in Waterloo Place, London, and at Portsmouth. Her other works include a statue of his companion, Dr. Wilson, at Cheltenham, one of Capt. Smith of the "Titanic" at Litchfield, and portrait busts of Mr. Asquith, Lord Knutsford, John Galsworthy, Granville Barker, and other well-known contemporaries. She was one of the first women to undertake munition making, and in 1916 she became private secretary to the secretary of the Ministry of Pensions. In Jan. 1922 her engagement to Lt.-Comm. Edward Hilton Young, D.S.O., M.P. (b. 1879), financial secretary to the Treasury, was announced.

SCOTT-GATTY, SIR ALFRED SCOTT (1847-1918), British herald and genealogist, was born at Ecclesfield, Yorks, April 26 1847, the son of the Rev. Alfred Gatty, vicar of Ecclesfield and sub-dean of York, by his wife Margaret Scott (see 11.530), a popular writer. One of his sisters was Juliana Horatia Orr-Ewing (see 10.40), the writer of children's books. The additional name of Scott was assumed by him by royal licence in 1892. He was educated at Marlborough and Christ's College, Cambridge. In 1880 he entered the Heralds' College and became Rouge Dragon pursuivant, and in 1886 was appointed York herald. In 1899 he became registrar of

the college, and in 1904 was made Garter principal king-at-arms and knighted. Sir Alfred Scott-Gatty was an authority on heraldry and genealogy, and presented many copies of records to the Heralds' College. He was also an accomplished musician, many of whose songs became popular. In 1911 he was created K.C.V.O. He died in London Dec. 18 1918.

SCRIABIN, ALEXANDER NICHOLAEVICH (1872-1915), Russian composer, was born at Moscow on Christmas day 1872 (O.S.). His father was a lawyer; his mother, a good pianist and pupil of Leschetitsky, died when he was one year of age. His schooling was received in the Moscow Cadet Corps, but he never showed any liking for the military career for which he was intended, and at 18 entered the Moscow Conservatory of Music where he was a pupil of Safanov and Tanier. On leaving the conservatory Scriabin was greatly helped by the patriotic music publisher Belayef, who brought out his earlier works and arranged a European piano recital tour for him. At 20 he returned to Moscow and joined the conservatory staff. Later he again travelled, this time for six years, visiting the United States amongst other countries. He then settled in Brussels for some time, and in 1910 returned to Moscow. In 1914 Scriabin visited England, giving two piano recitals, playing his own Concerto and appearing as pianist in his *Prometheus*. He was then suffering from a tumour of the lip, from which, soon after his return, he died, April 14, 1915.

As a composer Scriabin represents what may be called the classical school carried forward to its most advanced point. The form of his sonata and symphony movements he derives from Mozart, through Beethoven; however bewildering these may at first sound, they will be found, on a second or third hearing, to be laid out on essentially the Mozart-Beethoven lines. In his pianistic idiom and general pianistic qualities of style, Scriabin derives largely from Chopin, of whose work he was a great admirer. All this then indicates a conservative side to his composition, but he was more radical in his harmonies, and it was, probably, largely the novelty of these that retarded appreciation of his later works. Gradually he evolved what may be called a new scale or, from another point of view, a new chord. It consists of the upper partials of the fourth octave from the fundamental note, less two (taking C as the fundamental note—C, D, E, F♯, A, B♭ or, arranged as a superposition of fourths, as Scriabin most frequently uses them, C, F♯, B♭, E, A, D). The hint of this new harmonic scheme may be seen in the earliest compositions, and its development was fairly regular and consistent, until it came to dominate his later output. In his later works he discards entirely the old key signatures. In his orchestration Scriabin calls for a large force, and uses it very freely: his scores are excessively contrapuntal in texture, the various instruments moving very independently and weaving together their respective themes: muted brass plays a large part in his orchestral colour scheme. In the First Symphony a chorus is used in the finale; the "Poem of Fire" also uses a chorus, but in an orchestral way, no words being supplied. For the last-named work the composer also wrote an optional part for a "Tintiera per luce," or keyboard of light, the intention being that varying colours should play upon a screen as the work was being performed. The composer was greatly interested in theories as to a correspondence between the musical scale and the scale of colours. In his great *Mystery* (left unfinished at his death) music, dance, speech, perfume and colour were to be combined; this work was to be rather a work of ritual than of art, and was to express its author's idealistic mysticism through the medium of 2,000 participants.

It is usual to look upon Scriabin's musical work as largely the expression of theosophical views, and undoubtedly much of his inspiration was drawn from the works of Blavatsky and others. He was not, however, a close reader, or a careful thinker. Seizing the main idea of a book or a creed, he would neglect the details, and his imagination would quickly develop a huge scheme of thought having little relation to what he had read. The titles of many of his works and of their separate parts, and the marks of expression affixed to particular passages, indicate plainly the existence of a spiritual programme. "The emancipation of the human soul through ceaseless striving, and its achievement of self-expression, may be said, very roughly, to represent the general sense of the spiritual basis of Scriabin's musical works."

The works of Scriabin have been variously classed into periods. A logical classification is into four periods as follows: 1st period, with a strong Chopin influence; the dividing line between this and the 2nd period runs through the First Symphony, and the 2nd period shows some Wagner and Liszt influences; the dividing line between this and the 3rd period runs through the Fifth Sonata, and a 4th period begins with the "Poem of Fire."

Works.—Orchestral: *Revery* (op. 24); *Symph. I.* (26); *Symph. II.* (29); *Symph. III., or Divine Poem* (43); *Symph. IV.* (54); *Prometheus*, or "Poem of Fire" (60). **Piano:** *Sonatas I.* (op. 6);

II. (19); III. (23); IV. (30); V. (53); VI. (62); VII. (64); VIII. (66); IX. (68); X. (70). A very large number of preludes, études, impromptus, mazurkas, poems, etc., including the great "Vera la Flamme" poem and the much-discussed last work, the Five Preludes (*op.* 74). Piano and Orchestra: Concerto (*op.* 20). No songs or chamber music are included in Scriabin's output. (P. A. S.)

SCULPTURE (*see* 24.488).—The state of coma which, so far as public interest is concerned, had afflicted European, and particularly British, sculpture up to the neighbourhood of 1910, yielded at about that date to a long-sustained treatment of shocks administered by the exhibitors of what has been regarded as "freak" sculpture. These shocks, sporadic but startling and lingering in their effect, had persisted throughout the preceding decade, and the so-called "rebels," authors of these frequently unintelligible sculptural efforts, found their ranks considerably swelled by converts to a system that seemed both easy of adoption and financially profitable. Hitherto, indeed, British sculpture had been well-nigh moribund, and only on occasion had the public evinced an interest in the case by crowding the bedside of the invalid to witness in some London gallery the delirium of the dying art as represented by the works of some new "rebel."

The attention of the public was caught and their mind entertained to an unusual degree in the closing years of the last century when Rodin, the great French master, startled the world by his originality of thought and won admiration by the freshness and vigour of his work. The interest thus awakened was, however, ill sustained in England, until the breach with academicism which Rodin inaugurated by his originality and independence was reflected and rendered wider in the work of the artistic "rebels" in Great Britain. The wave of revulsion from academicism and realism reached perhaps its high-water mark in 1910, and in 1911 had shown no sign of ebbing.

It would be difficult to classify these revolutionaries or to apply to their work any generic term, yet this movement has something in common with the post-impressionism of the painters. It had reached England from the Continent, where it was far more widely spread and had rooted more deeply. In France it received smaller encouragement than in Germany and Austria, where its influence is revealed in much of the recent monumental sculpture. The gospel of the movement forbids in chief any show of anatomical detail, and allows but little of true construction or of natural forms.

There can be little doubt that to this movement, in part at least, was due the awakening of public interest in sculpture about the year 1910. It was during the following year that considerable efforts were made to collect for public exhibition the works of that foremost of British sculptors, Alfred Stevens. That these efforts were successful was plain from the space devoted to the exhibition in the Tate Gallery during Nov. and Dec. 1911 and Jan. following. This exhibition constituted in the case of the majority of visitors a first introduction to the finest sculptor Great Britain had produced. The interest it provoked encouraged a scheme for a further and more permanent collection and preservation of the scattered works of this great master. Public interest in Stevens was promoted to a very large extent by the labours of the Stevens Memorial Committee, and by the enthusiasm and solicitude of Prof. Legros, and it was on behalf of this Committee that in 1911 the late Sir William Richmond presented to the trustees of the gallery an interesting bust of Stevens by Edouard Lanteri. Since then the collection at the Tate Gallery has been enriched by a cast of Stevens's remarkably fine chimney piece at Dorchester House.

Foremost of European sculptural works raised in 1911 were, in Rome, the large memorial to King Victor Emmanuel, and, in London, the great memorial to Queen Victoria at Buckingham Palace. The Victor Emmanuel monument reveals no individualism or inspiration in its design or modelling. The Victoria Memorial, largest of sculptural monuments in London, is imposing in its effect and is magnificently situated at the head of the Mall and before the Palace. In 1912 the great bronze quadriga by Adrian Jones was placed upon Decimus Burton's arch at the top of Constitution Hill, London.

The revival of sculpture which marked this period was not evident alone in parochial and civic patronage; it was found—not for the first time—a suitable and convenient, and certainly an effective, channel, through which might be expressed international courtesies adaptable to various occasions. Three such works, which might be regarded as political, were erected in London during the year 1920-1, to which reference will be made later. During 1912 two such monuments were unveiled in France, both of which were in the form of courtesies between that country and Great Britain. On April 13 M. Poincaré unveiled at Nice the Queen Victoria Memorial, and on April 13 a memorial to King Edward was presented to the public at Cannes.

In the meantime one of the most important events of 1912 in England was the completion of Alfred Stevens's monument to the Duke of Wellington in St. Paul's Cathedral by the addition of the bronze equestrian statue of the duke which was designed to surmount the monument. Alfred Stevens, the designer of this splendid work, had died leaving the memorial incomplete, and it must for ever remain a matter for regret that many important architectural features in Stevens's original design were modified with results destructive to the purity of the style and the elasticity of the structure. It was not until 45 years after Stevens's untimely death that the screens were removed and the completed monument revealed to the public gaze. Fortunately the great sculptor had left behind him a small model which he had designed for the equestrian group, and John Tweed, who was finally commissioned to carry out this portion of the work, followed and developed with no mean intelligence the ideas conveyed in the small original model. The result is not, however, as happy as could have been desired. The horse is in the Renaissance style as intended by Stevens, and is in keeping with the rest of the design; the light is quite inadequate to illuminate the upper parts of the monument, which is far too high for its position, the bronze group barely clearing the overhead structure of the building and consequently suffering some obscurity.

The Tate Gallery, in London, latterly more fittingly known as the National Gallery of British Art, was enriched by the addition of Havard Thomas's bronze statue "Lycidas," the gift of Mr. and Mrs. E. Sadler, while perhaps the most interesting work in the Royal Academy exhibition of 1912 was the same sculptor's statue "Thyrsis," which was acquired by the Felton Bequest Committee for the National Gallery of Melbourne.

The outbreak of the World War had no immediately noticeable effect on British sculpture. The work shown at the Royal Academy exhibition just then concluded had been of an unusually high standard, Sir Thomas Brock's statue of Capt. Cook had been set up in the Mall, London, and a very large number of works of some importance were well on the way to completion in the autumn of 1914. These did much to cover any paucity which might have been apparent in the exhibition of the following year. Nevertheless, upon the outbreak of hostilities a vast number of contracts for important architectural sculpture were at once cancelled or their execution postponed. This, it is hardly necessary to say, resulted in a period of distress and stagnation which terminated only with the demand for war memorials after the signing of the Armistice.

While general attention was focussed upon the war, British sculpture suffered a severe blow by the death of Prof. Edouard Lanteri, of the Royal College of Art. As a sculptor his output amounted to little, but, as he himself would have had it, the fruits of his teaching will long survive him, and those sound constructive principles of sculpture which he taught will remain an influence in that distinctively British school of sculpture which he endeavoured to promote.

Two works of outstanding beauty and remarkable workmanship in the Academy exhibition of 1914 should be mentioned: Havard Thomas's bronze cast of his "Thyrsis," which had appeared in wax two years previously, and Derwent Wood's bronze bust of Mr. Henry James.

No sculpture of importance was made public during 1915 beyond Rodin's "Burghers of Calais," Lady Scott's statue of Capt. Scott, and such works as were exhibited at the Royal

Academy. Mr. Toft's figure, "The Bather," was a notable exhibit, and it was bought by the Trustees of the Chantry Bequest for the national collection. A large work in marble which attracted much attention was the statue "Premier Ministre" by the Belgian sculptor Egide Rombeaux. Political interest in Serbia, arising out of the war, was in part responsible for the exhibition this year in London of the work of Mestrovic, the Serbian sculptor; his work, though showing an extreme revolt against academicism, is undoubtedly powerful and full of individualism. Rodin's already well-known bronze group, "The Burghers of Calais," purchased in 1912 by the National Arts Collection fund, was erected in Victoria Tower Gardens, London, and the memorial statue of Capt. Scott was set up in Waterloo Place, London.

Derwent Wood won further honour with his child's head (a portrait of Master Charles Haviland Hillman) in the Academy in 1917. This year was specially marked, however, by the death of that greatest of modern sculptors, Auguste Rodin, a master who has exercised probably a greater influence upon the sculpture of his day than has any before him. His works had long since found their way into every important public and private collection of modern art in Europe and America; a triumph of extraordinary significance, because it was not until comparatively late in his career that he won official recognition.

In Aug. 1919 a picturesque figure was removed from sculpture circles by the death of Walter Winans. Never a sculptor of more than technical ability, Winans worked to please himself and for the entertainment of his friends. Horses and shooting were perhaps as great a passion with him, and, though in sculpture he was a gifted dilettante and no more, he had some successes and was widely known.

Save for the few exceptions of those men who were physically unable to render war-service, almost every British sculptor had now been for some time with the fighting forces or engaged in the hospitals or munition works at home. Metals—particularly those of which bronze is constituted—were controlled by Government in order to safeguard the supply necessary to the manufacture of war munitions. This supply, though sufficient for those needs, did not very far exceed them; it is worthy of note, therefore, that the Government, in the interests of sculpture, ascertained the average amount of bronze used by those sculptors who were still at work, and assigned to each such quantity of metal as was in fair proportion to his previous needs. Beyond this, however, the British Government did little or nothing to encourage or to make use of sculpture, though Germany, in the meantime, found a valuable weapon in the production of war medals, which were designed as propaganda to serve the double purpose of heartening the German people by commemorating real or supposed victories and of disseminating in neutral countries evidence of Albion's perfidy and of the success of German arms. These medals, of which some hundred or more were designed, are in very many cases works of a high artistic order, and several museums in Great Britain have secured fairly representative collections of them.

During 1920-1 no fewer than three public statues which may well fall under the category of "International Courtesies" were erected in London: the monument of "Gratitude" (a bronze group by Victor Rousseau)—the gift of Belgium—erected on the Thames Embankment in Canning Enclosure, Westminster; the statue of Abraham Lincoln by Saint-Gaudens—a gift of the United States; and the bronze replica of Houdon's George Washington, presented by the state of Virginia and set up in Trafalgar Square.

The London memorial to Nurse Cavell by Sir George Frampton, erected near St. Martin's church, Trafalgar Square, caused something like a sensation in 1920 by the evidence it gave of this well-known academic sculptor's conversion to simple and severe forms of archaicism. This was particularly noticeable in the treatment of the architectural forms. Some remarkable sculpture was exhibited in June 1921 by Paulanship, a sculptor of great individuality and strength of modelling. In July 1921 Bertram MacKenna's equestrian statue of King

Edward VII. was unveiled in Waterloo Place by King George. The sculptor was knighted after the ceremony. In Scotland Mr. Pettendrih MacGillivray was made "King's Sculptor," a title that has no counterpart in England. (C. Po.)

UNITED STATES.—Although the period 1910-20 brought to light no new master in American sculpture, it showed an increase in the number of sculptors, and much good work was done. D. C. French, who in 1920 had reached the age of 70, was still indefatigable; conspicuous among his later works were the "Melvin Memorial" and the statue of Emerson, both at Concord, Mass.; "Lincoln," at Lincoln, Neb.; the Longfellow and Lafayette reliefs; the exquisite Spencer Trask Memorial at Saratoga Springs, N.Y.; and the imposing "Lincoln" for Washington, D.C., besides a score of architectural groups of high value. F. W. MacMonnies erected a "Pioneer Fountain" at Denver and a Washington group at Princeton, N.J. G. G. Barnard was as always original; his gigantic processions in Harrisburg, like his rugged "Lincoln" in Cincinnati, compelled attention and discussion. Paul Bartlett devoted years to his equestrian "Lafayette" for Paris, following this with the pedimental group for the capitol, Washington, D.C. Henry Shrady's monument to General Grant (Washington, D.C.) was a work of sincerity. H. A. MacNeil embellished Ohio's capitol with his "McKinley Memorial" and Albany with a soldiers' monument. St. Paul and Springfield, Ill., and Worcester, Mass., gained new works by Andrew O'Connor. A. A. Weinman's Baltimore group, C. Keck's "Republic" in Pittsburgh, and H. A. Lukeman's various monuments were important contributions. Karl Bitter's untimely death in 1915 was a great loss; among his last works were the admirable East pediment of the Wisconsin state capitol, the austere "Carl Schurz" (New York), and the "Lowry Memorial" in Minneapolis. Another good pediment was that of the Kentucky capitol by Charles Niehaus. Miss Anna Hyatt's "Joan of Arc" (New York) was completely successful. Cyrus E. Dallin continued his mounted Indians; "The Appeal to the Great Spirit" was perhaps the finest. J. E. Fraser's "End of the Trail" was a notable achievement. Among portrait statues were Weinman's seated "Lincoln" (Hodgensville, Ky.); Edmund T. Quinn's "Edwin Booth" (New York); R. Tait McKenzie's "Whitefield" (Philadelphia); and Leonard Crunelle's "Governor Oglesby" (Chicago). Herbert Adams produced his "Bryant" (New York), as also his graceful MacMillan Fountain in Washington, D.C. In portrait busts Charles Grafly continued to lead, with his former pupil, Albin Polasek, a close second. Attilio Piccirilli's "Outcast" and "A Soul" were sculpture "by first intention." McCartan's graceful fauns and Rudolf Evans' beautiful "Golden Hour" were of this period. Chester Beach and Paulanship continued their successful work. Sherry Fry's fountain for St. George, Staten Island, revealed skill of a high order. Evelyn Longman was well represented by her Allison Memorial (Des Moines, Ia.), and the Illinois Centennial Monument, Logan Square, Chicago. Nellie V. Walker had important works in many western cities—for example, her heroic "Keokuk." Lorado Taft's "Black Hawk" and several fountains were also of this period. Doubtless the most stimulating event of the decade was the Panama-Pacific Exposition of 1915 in San Francisco. Among the many sculptors who made valuable contribution to its display of decorative art were Calder, Aitken, Roth, MacNeil, Jaegers, and Kontl. (L. T.)

SEAMAN, SIR OWEN (1867-), English poet and editor of *Punch* (see 24.543), was knighted in 1914. His later volumes include *War Time* (1915); *Made in England* (1916) and *From the Home Front* (1918), mainly reprints of verses contributed to *Punch*. At the beginning of the World War he joined the "Veterans" corps of the former Inns of Court Volunteers, later known as the Inns of Court Reserve Corps (2nd batt. of the County of London Volunteer Regt.). He was gazetted lieutenant in 1916.

SEDGWICK, ADAM (1856-1913), English biologist, was born at Norwich Sept. 28 1856. Educated at Marlborough, King's College, London, and Trinity College, Cambridge, he became fellow and tutor of his college and assisted F. M. Balfour the first

professor of animal morphology at Cambridge. From 1890 to 1907 he held a readership in that subject himself, and in 1907 became professor of zoology in Cambridge University. Two years later he was transferred to the Imperial College of Science and Technology in the same capacity. Details of his work in cytology and embryology are to be found in 7.720, 9.320 and 328. He died in London Feb. 27 1913.

SEEBOHM, FREDERIC (1833-1912), English historian, was a native of Bradford and came of a Quaker family. His interest in problems of modern life, social and religious, led him to study the conditions of English rural life in the past and the religious movements of the Reformation. In his *English Village Community* (1853) he dwelt on the survival of Roman influences in agricultural life; and in his *Tribal Systems in Wales* (1895) he reconstituted a Celtic society from 14th century evidence. He died at Hitchin Feb. 6 1912.

SEELY, SIR CHARLES, 1ST BART. (1833-1915), British politician was born at Lincoln Aug. 11 1833. He came of a family which held large property, including coal-mines, in the Midlands, and also in the Isle of Wight. In 1869 he entered the House of Commons as Liberal member for Nottingham, but lost his seat at the general election of 1874. He was re-elected in 1880, but seceded from the Liberal party on Irish Home Rule, and in 1885 lost his seat. He was once more elected in 1892, and held the seat until 1895. In 1896 he was created a baronet. Sir Charles Seely was a warm supporter of the Volunteer movement. He died suddenly at Brooke House, Isle of Wight, April 16 1915.

His youngest son, **JOHN EDWARD BERNARD SEELY** (1868-), British politician, was born at Brooke Hill Hall, Derbyshire, May 31 1868. Educated at Harrow and Trinity College, Cambridge, he was called to the bar in 1897, and from 1900 to 1901 served with the yeomanry during the South African War. In 1900 he entered the House of Commons as Liberal member for the Isle of Wight, but was defeated at the 1906 election. He was, however, elected the same year for the Abercromby division of Liverpool. In 1908 he entered the Asquith Government as Under-Secretary for the Colonies, but in 1910 lost his seat, although in the second general election of that year he stood successfully for the Ilkeston division of Derbyshire. In 1911 he was made Under-Secretary for War, and in 1912 became War Minister. Owing, however, to the events attending the Curragh incident of 1914, he resigned in the summer. He served in the army with distinction in the World War, rising to the rank of general in 1918, and on his return to official life became parliamentary under-secretary to the Ministry of Munitions and deputy-Minister of Munitions (1918). In Jan. 1919 he became Under-Secretary for Air, and president of the Air Council, but resigned in Nov. of the same year.

SÉGUR, PIERRE M. M. H., MARQUIS DE (1853-1916), French author (see 24.584), died at Poissy Aug. 13 1916.

SEISMOLOGY (see 8.817 and 24.589).—Strictly speaking, seismology is that department of knowledge which is concerned with the study of earthquakes, and such was its meaning up to the end of the 19th century, the older seismology being exclusively concerned with the earthquake which could be felt. In the early nineties it was discovered that suitably designed and sufficiently sensitive seismometers recorded disturbances which were evidently connected with great earthquakes, and, as it was known that the intensity of disturbance decreased with an increase of distance from the central region of greatest violence, it was natural to conclude that the very small disturbances, registered at great distances, were due to the same cause that gave rise to the destructive earthquake. With the accumulation of observations difficulties began to arise; it was found that neither the magnitude of the disturbance, nor the distance at which record could be obtained, bore any constant relation to the magnitude of the earthquake. Some shocks of great violence gave small records, not extensively distributed, while others of much less violence gave the place of origin gave much larger records and were distributed all over the earth. The distant records, however, continued to be regarded as records of the earthquake, and are generally described as such. In 1906 Dr. G. W. Walker, when examining the circumstances

of the Californian earthquake of 1906, arrived at the conclusion that the fractures and dislocations of the surface rocks, which gave rise to the destructive earthquakes, were but a secondary consequence of a deep-seated disturbance, to which he gave the name of *bathyseism*, and suggested that this, and not the earthquake, was the origin of the disturbance which, propagated through the interior of the earth, gave rise to the long-distance records, commonly known as seismograms. Subsequent consideration of other earthquakes confirmed his belief in the correctness of the conclusion, and from this it results that the word "seismology" is at present being used to cover two distinct and independent departments of study, which may be distinguished as *teleseismology* (τῆλε, distant) or the study of the long-distance records, and *engyseismology* (ἐγγύς, near) or the study of the earthquake proper, each being distinct and independent offshoots of the bathyseism, or deep-seated disturbance. It is the first of these which, at the present day, is more especially meant by seismology, and it is an instance of the way in which words gradually depart from their original meaning, that the term should have come to imply something which has no direct connexion with earthquakes.

Nothing is known at present of the origin of the bathyseism, and very little of the depth at which it originates. The latter probably varies considerably, those disturbances which give rise to well-marked teleseisms and moderate surface earthquakes taking place at greater depths than others which are accompanied by violent and destructive earthquakes. The only suggestion which has yet appeared of the depth of origin is by Dr. G. W. Walker, who has followed up certain investigations, started by Prince Boris Galitzin, of the angle of emergences of the wave-paths, and finds that in many cases they indicate an origin at a considerable depth (it may be as much as 1,200 km.) below the surface. These investigations require following up before they can be accepted as conclusive, but the suggestion is of interest; there is no inherent impossibility, and it seems to offer a possible explanation of some difficulties which have arisen in the interpretation of the long-distance seismograms.

Since 1910 many improvements in detail have been made in the instruments used for obtaining the long-distance records of the newer, or tele-, seismology, and an entirely new principle was introduced by the late Prince Boris Galitzin for a direct measurement of the acceleration of the true motion of the ground. This instrument is based on the fact that, if a plate of quartz is subjected to pressure between two sheets of metal, a free electric charge appears in those sheets, the amount of which is proportioned to the pressure. An instrument was actually constructed on this principle and subjected to experimental tests, but has not been applied to the recording of natural disturbances, owing to the death of the inventor and the effects of the political revolution in Russia.

The rate of propagation of wave-motion through the earth, as registered by long-distance seismographs, has been investigated by Dr. C. G. Knott, who has succeeded in solving the mathematical difficulties of the problem. He finds that the rate of transmission of both the first phase, condensational, and of the second phase, distortional, waves increases continuously till the wave-path attains a depth of about three-tenths of the earth's radius, the wave-paths reaching lesser depths than this having a continuously curved form, convex towards the centre of the earth. Beyond this the rate of propagation is nearly constant, even decreasing at certain depths so that some of the wave paths are concave towards the centre in part of their course. Below six-tenths of the radius the distortional wave is killed out, and is not registered at distances greater than 120° from the epicentre. The rate of propagation of the two forms of wave-motion is about 7.2 and 4.0 km. per second respectively, near the surface of the earth, and about 12.8 and 6.8 at depths of over 1,500 kilometres.

For the older seismology or study of earthquakes proper, see GEOLOGY (section *Dynamical Geology*).

AUTHORITIES.—The best general introduction to the newer seismology is Dr. G. W. Walker, *Modern Seismology* (1913). The most complete is by Prince B. Galitzin, original in Russian; a German translation, *Vorlesungen in Seismometrie*, appeared in 1912. G. W.

Academy. Mr. Toft's figure, "The Bather," was a notable exhibit, and it was bought by the Trustees of the Chantry Bequest for the national collection. A large work in marble which attracted much attention was the statue "Premier Ministre" by the Belgian sculptor Egide Rombeaux. During 1920-1 no fewer than three public statues which may well fall under the category of "International Courtesies" were erected in London: the monument of "Gratitude" (a bronze group by Victor Rousseau)—the gift of Belgium—erected on the Thames Embankment in Canning Enclosure, Westminster; the statue of Abraham Lincoln by Saint-Gaudens—a gift of the United States; and the bronze replica of Houdon's George Washington, presented by the state of Virginia and set up in Trafalgar Square.

The London memorial to Nurse Cavell by Sir George Frampton, erected near St. Martin's church, Trafalgar Square, caused something like a sensation in 1920 by the evidence it gave of this well-known academic sculptor's conversion to simple and severe forms of archaicism. This was particularly noticeable in the treatment of the architectural forms. Some remarkable sculpture was exhibited in June 1921 by Paulanship, a sculptor of great individuality and strength of modelling. In July 1921 Bertram MacKennal's equestrian statue of King

Edward VII. was unveiled in Waterloo Place by King George. The sculptor was knighted after the ceremony. In Scotland Mr. Pettendrih MacGillivray was made "King's Sculptor," a title that has no counterpart in England. (C. Po.)

UNITED STATES.—Although the period 1910-20 brought to light no new master in American sculpture, it showed an increase in the number of sculptors, and much good work was done. D. C. French, who in 1920 had reached the age of 70, was still indefatigable; conspicuous among his later works were the "Melvin Memorial" and the statue of Emerson, both at Concord, Mass.; "Lincoln," at Lincoln, Neb.; the Longfellow and Lafayette reliefs; the exquisite Spencer Trask Memorial at Saratoga Springs, N.Y.; and the imposing "Lincoln" for Washington, D.C., besides a score of architectural groups of high value. F. W. MacMonnies erected a "Pioneer Fountain" at Denver and a Washington group at Princeton, N.J. G. G. Barnard was as always original; his gigantic processions in Harrisburg, like his rugged "Lincoln" in Cincinnati, compelled attention and discussion. Paul Bartlett devoted years to his equestrian "Lafayette" for Paris, following this with the pedimental group for the capitol, Washington, D.C. Henry Shrady's monument to General Grant (Washington, D.C.) was a work of sincerity. H. A. MacNeil embellished Ohio's capitol with his "McKinley Memorial" and Albany with a soldiers' monument. St. Paul and Springfield, Ill., and Worcester, Mass., gained new works by Andrew O'Connor. A. A. Weinman's Baltimore group, C. Keck's "Republic" in Pittsburgh, and H. A. Lukeman's various monuments were important contributions. Karl Bitter's untimely death in 1915 was a great loss; among his last works were the admirable East pediment of the Wisconsin state capitol, the austere "Carl Schurz" (New York), and the "Lowry Memorial" in Minneapolis. Another good pediment was that of the Kentucky capitol by Charles Niehaus. Miss Anna Hyatt's "Joan of Arc" (New York) was completely successful. Cyrus E. Dallin continued his mounted Indians; "The Appeal to the Great Spirit" was perhaps the finest. J. E. Fraser's "End of the Trail" was a notable achievement. Among portrait statues were Weinman's seated "Lincoln" (Hodgensville, Ky.); Edmund T. Quinn's "Edwin Booth" (New York); R. Tait McKenzie's "Whitefield" (Philadelphia); and Leonard Crunelle's "Governor Oglesby" (Chicago). Herbert Adams produced his "Bryant" (New York), as also his graceful MacMillan Fountain in Washington, D.C. In portrait busts Charles Grafly continued to lead, with his former pupil, Albin Polasek, a close second. Attilio Piccirilli's "Outcast" and "A Soul" were sculpture "by first intention." McCartan's graceful fauns and Rudolf Evans' beautiful "Golden Hour" were of this period. Chester Beach and Paulanship continued their successful work. Sherry Fry's fountain for St. George, Staten Island, revealed skill of a high order. Evelyn Longman was well represented by her Allison Memorial (Des Moines, Ia.), and the Illinois Centennial Monument, Logan Square, Chicago. Nellie V. Walker had important works in many western cities—for example, her heroic "Keokuk." Lorado Taft's "Black Hawk" and several fountains were also of this period. Doubtless the most stimulating event of the decade was the Panama-Pacific Exposition of 1915 in San Francisco. Among the many sculptors who made valuable contribution to its display of decorative art were Calder, Aitken, Roth, MacNeil, Jaegers, and Kontl. (L. T.)

SEAMAN, SIR OWEN (1867-), English poet and editor of *Punch* (see 24.543), was knighted in 1914. His later volumes include *War Time* (1915); *Made in England* (1916) and *From the Home Front* (1918), mainly reprints of verses contributed to *Punch*. At the beginning of the World War he joined the "Veterans" corps of the former Inns of Court Volunteers, later known as the Inns of Court Reserve Corps (2nd batt. of the County of London Volunteer Regt.). He was gazetted lieutenant in 1916.

SEDGWICK, ADAM (1856-1913), English biologist, was born at Norwich Sept. 28 1856. Educated at Marlborough, King's College, London, and Trinity College, Cambridge, he became fellow and tutor of his college and assisted F. M. Balfour the first

the name of Burgenland. The case of East Galicia was left open, and so remained in 1921. Experience in the case of Upper Silesia abundantly proved the wisdom of thus limiting the right of self-determination. Plebiscites had worked smoothly enough in the case of fairly homogeneous areas defined by ancient boundaries, as in Avignon in 1791 and Savoy and Nice in 1860; they are altogether another matter in districts inhabited by mixed populations divided by bitter national jealousies. The method proved in any case to be costly and dilatory. In large areas it involved an extensive military control which the victorious Allies were unable to provide, while it was impossible to set up provisional governments to supervise the partition of areas over which they exercised control.

The experience of the diplomatists at Versailles has then, if properly studied, great value as a corrective to the dreams of idealists who persist in building theories for an imaginary world. But, apart from this experience, it is certain that the principle of self-determination could not be universally applied without overthrowing all that remains of the world's order. Yet the principle remains, in spite of disillusionment, a powerful solvent of established bodies politic, and it is therefore still important to understand its implications. The phrase "the self-determination of nations" is widely accepted as the expression of a principle as clear as it is just. So far as the meaning of self-determination is concerned, it is indeed clear enough. What is not so clear is what is meant by a "nation." This is a subject round which interminable discussions have centred, and which must be examined if the full implications of the principle of self-determination are to be realized.

Definition of Nation and Nationality.—Legally defined, a nation is the aggregate of the subjects or citizens of a particular sovereign state, and nationality is the quality of such subjection or citizenship. But the word "nation" has also a wider meaning, which the *New English Dictionary* embodies in the following inclusive definition:—"A nation is an extensive aggregate of persons closely associated with each other by common descent, language, or history, so as to form a distinct race or people, usually organized as a separate political State and occupying a definite territory." This definition is open to criticism, as involving some confusion of thought: and this confusion is not made less confounded by the definition of "nationality" as primarily synonymous with "nation" but "frequently a people potentially but not actually a nation," while a "people" is defined as "a body of persons composing a community, tribe, race, or nation."

The truth is that the vagueness of our terms reflects the vagueness of our ideas about a problem the intricacies of which we have only recently been called upon to unravel. No satisfactory definition of the word "nation" is possible because, save in its legal sense, it conveys no definite idea; and the same is true of the word "nationality." Yet a clear definition is the essential preliminary to any fruitful discussion. It is proposed then, for the purposes of the present argument, to use the word "nation" in the sense of "the sum of people constituting a sovereign and independent body politic," the Latin *populus* as distinguished from *natio*. The word "nationality" it is proposed to deprive of its legal connotation, and to define a nationality as "an extensive aggregate of persons conscious of a community of sentiments, experiences, or qualities which make them feel themselves a distinct people." The various elements that produce this consciousness will be discussed later. They have an important bearing on the practical problem which was only very imperfectly solved by the Treaty of Versailles, namely, the problem raised by the claim of nationalities, thus defined, to become nations. The complexity and perils of the issues involved in this claim may be illuminated by the fact that, even now, in the actual politics of the world, nationalities and nations nowhere coincide. It remains, therefore, of great importance to determine what are the essential qualities of nationality and what are its necessary relations to the conception of the state.

Theories of Nationality.—On few subjects has there been so great a difference of opinion as on the question of what con-

stitutes nationality. Fichte explained it, in terms of his transcendental philosophy, as a thing divine and spiritual, a manifestation of the mind of God revealing itself in the national soul. So, too, for Mazzini, the prophet of the Italian *risorgimento*, nationality was a thing sacred, not to be profaned by a cold analysis of its elements, but believed in and suffered for as a prime article of faith—the "faith in liberty"; for him the map of Europe would have to be redrawn on national lines as the necessary first step towards "the universal association of the human race."¹ No student of the history of the rise of nationalities during the last hundred years will underrate the part played by such prophets as these. Yet their enthusiasm by itself explains nothing and would have achieved nothing; it is like fire, itself a subtle and mysterious element, which yet needs very material fuel to feed its destructive and creative force. The explanation of the phenomena of nationality, as other thinkers have realized, must be sought, not in the region of metaphysics, but in that of observed facts.

If we analyze the composition of the several nationalities, we find these elements: race, language, religion, common habitat, common conditions, mode of life and manners, political association. These elements are, however, never all present at the same time, and none of them is essential. Community of race, even where this is put in the forefront of the claim of nationality, is mainly a politic fiction, at least in countries of European civilization, in which the races are inextricably mixed up. Language, again, is as little as race the criterion of nationality. It may be, as Bluntschli says, the expression of a common spirit and of intellectual intercourse, and as such it may be brought powerfully to the aid of nationality, as in the case of the Czech language in Bohemia, or, still more strikingly, of the English language in the United States. But nationality and inherited community of speech are not identical. The Swiss are a distinct nationality, though they speak four different languages. Community of language, on the other hand, has not prevented the British and the Americans from developing different nationalities. Religion, too, has clearly no necessary connexion with nationality, though it has played a great part in creating and stereotyping nationalities, notably in countries of backward civilization, as in the Balkan peninsula or in Ireland. A common habitat and common conditions are doubtless powerful influences at times in determining nationality; but people have thus lived together for centuries without developing a national consciousness, and in many cases—notably in the east of Europe—they have evolved separate national consciousnesses in spite of a common habitat and common conditions. As for manners and mode of life, these are apt to raise stronger barriers between classes than between nationalities. Lastly, political association, though—as in the case of the Swiss—it sometimes encourages the spirit of nationality, is more often its result than its cause.

All these elements, then, may or may not contribute towards the formation of a nationality, but when we have summed them up we are no nearer to a solution of the problem of its formation. Some theorists seek this solution in a psychological process. "A nationality," says Bluntschli, "only comes into being slowly, by a psychological process which gradually produces in a mass of men a distinctive form of existence and community of life, and stereotypes these as the inheritance of the race."² For him time, and a tradition of many generations, are the essential conditions. This may be true of the evolution of new nationalities; it is not true of the creation of a new sentiment of nationality in even large masses of persons. It is, for instance,

¹ *Scritti* (18 vols., Milan-Rome, 1861-91), viii., 205; xi., 181, 243; xii., 245. Mazzini avoided the practical problem involved in the reconstruction of Europe on national lines by saying that it was sufficient to indicate the "large lines" and "to leave details to the future and to the votes of the peoples" (x., 137). His own plan of reconstruction included the restoration to Poland of the frontiers of 1772, and the setting up of a Bohemian-Moravian-Hungarian federation. As Signor Salvemini (*Mazzini*, 1920) points out, "the 'design of God' was not quite so clear as Mazzini believed."

² *Lehre vom modernen Staat* (5th ed. of *Allgemeines Staatsrecht*, 1875), i., p. 92.

the boast of the United States that they have been able to absorb annually some million of alien immigrants, and that one generation has usually sufficed to give them not only the name but the full sense of American nationality. The "psychological" element, indeed, may be admitted, but it does not explain the whole of the phenomena nor the ultimate driving force, so to speak, of nationality.

The German historian Karl Lamprecht came nearer the truth when he added another element, the economic, as the creative force in the evolution of nationality. Like Bluntschli, he found a general law for this evolution in the development of the *Volksgeist*, but he explains this development by changes in economic conditions. Nationality, that is to say, is but a manifestation of the instinct of men to group themselves for the defence of their common interests, and it follows that the groups thus formed tend to shift and change with the ebb and flow of the economic struggle for existence. This view, which—if it be sound—obviously conflicts with the belief that the triumph of the principle of self-determination would bring permanent peace to the world, was elaborated by the Austrian Socialist Otto Bauer, in his *Nationalitätenfrage*, with special reference to the nationality question in the former Habsburg Monarchy. "It is," he said, "the battles of the economic classes, everywhere active, the changes in the means and the conditions of work which determine the strength and weakness, the death and rebirth of nationalities." The determining factors of nationality in Austria-Hungary—which for the purpose of this study might be considered the laboratory of Europe—he declared to be not cultural but economic. The mass of men, the peasants and the labourers, are incapable of that consciousness of a widespread, common, inherited culture which is supposed to be the hallmark of nationality; but they are dissatisfied with their lot, resentful of the dominant powers whom they hold responsible, and ready therefore to group themselves against them.

This revolutionary tendency, which among the lower classes of the dominant races is anti-national and cosmopolitan, is apt among subject races to express itself in *nationalism*. The process was strikingly exemplified in Bohemia, where the flood of Czech nationality followed the channels opened up by industrial change, and German nationality succumbed not so much to cultural as to economic pressure. Before the World War the same process was taking place in all the eastern marches of Germany—in Silesia, in Posen, and in East and West Prussia, in which for years past the German element had been succumbing to the irresistible flood of Polish nationality, of which the unifying force was the economic opposition of the Slav proletariat and peasantry to the German capitalist and governing classes. The same phenomenon is apparent in the case of Ireland. The idealists of Sinn Féin never succeeded in inspiring the shrewd peasantry with their own enthusiasm for their "Milesian past"; the use of the renovated Gaelic language remained a conceit of the "intellectuals" of the cities; and the labourers and peasants were won to the Republican cause by a frank appeal to their economic interests—the promise of small holdings and of freedom from war taxation and the burden of the national debt.

It is then clear that there is an economic basis for nationality, and that, whatever other elements may enter into it, a sense of community of material interests is always present. It may be added that this sense is the strongest and most essential factor, and that without it nothing else will serve to maintain the common sentiment. Common origin, common language and a common tradition of culture and laws will not preserve the unity of a nationality when the material interests of its parts come into violent conflict. This truth received its most momentous illustration in the secession of the southern states of the American Union in 1860-1 and the bitter struggle that followed. The principle of state sovereignty and independence on the one side, and that of American national union on the other, did but disguise the true causes of the struggle, which were less political than economic; the agricultural south was determined to preserve its economic system, based on negro slavery; the industrial north was primarily inspired, not by any abstract love of

coloured humanity, but by the economic objection of the labouring masses to the slave system.

Relation of Nationality to the Nation or State.—In considering the relation between the idea of nationality and that of the state we are apt to be confused by the romantic and idealistic tinge given to the idea of nationality by the poets and philosophers of the struggles for freedom. A nationality, conceived as something divinely inspired, is believed to have not only the capacity but the right to become a nation, and its legitimate growth to be necessarily stunted if it be prevented from doing so. Bluntschli, for instance, described a nationality as an incomplete organism which could only become completed as an effective "personality" by political organization as a nation or state, and some such idea underlay the Liberal enthusiasm for that "principle of nationalities" which during the last hundred years has so profoundly changed the map of the world. But when we come to examine this principle, as stated by its most conspicuous champions, we find no clear conception of what it ultimately involves, while the main question—of what constitutes a nationality—is consistently begged. The late M. Émile Ollivier, for instance, defines the principle of nationality (and incidentally of self-determination) as follows:—

This principle is that every association of men called a people is an independent individuality; free, sovereign, enjoying the imprescriptible right of self-determination (*de disposer d'elle-même*) both in internal and external affairs.¹

If the word "people" be taken in its usual non-political sense, this statement was, and remains, obviously untrue, or represents at most an aspiration; if it means a *nation*, then the principle as here defined is merely that of the sovereign independence of nations, i.e. states, which has always been a fundamental doctrine of international law; it is, that is to say, a conservative, not a revolutionary principle. But this is not what M. Ollivier meant by it. For him, as the apologist of the Liberal Empire, the principle of nationality was dynamic, not static; it involved a regrouping of the nations, not—as Alexander I. of Russia had once proposed—by the formation from above of homogeneous populations fenced off by their natural boundaries, but by the free vote of the people concerned—the Napoleonic plebiscite. This principle of nationalities, he says in his *L'Empire libéral*, is to be carefully distinguished from the theory of great agglomerations, the natural limits of the race, for race has nothing to do with it:—

In the politics of nationality there are no natural frontiers. The true frontiers are those fixed by the will of the populations. The idea of race is barbarous, exclusive, retrograde, having nothing in common with the large, holy, civilizing idea of country (*patrie*).

Renan, in his *Qu'est-ce qu'une nation?* comes to much the same conclusion. A *Zollverein*, he says, is not a *patrie*; a nation is a grand aggregation of men with a moral conscience which causes them to sacrifice their individual interests to those of the community; wherever the existence of such a moral conscience is proved a nation exists as of right. "If there is any doubt as to its frontiers, consult the populations in dispute."

This solution of a difficult problem would be admirably easy were the rivalries of nationalities confined to the frontiers of states, which we have the best reason to know they are not, and were these frontiers themselves a mere question of marks on the map. But in any case, as Herr Bauer points out, this "psychological-voluntarist" theory begs the whole question of nationality, for it does not explain the factors that determine the will of populations to form a nation or to attach themselves to a nation already formed—supposing they are conscious of possessing a choice. It does not, that is to say, give us the real connecting link between nationality and the state, nor does it explain why in the 19th century, for the first time, nationality was erected into a *Staatsprinzip*.

Historically it seems clear that the explanation is at least largely economic. It may be true that a *Zollverein* does not constitute a *patrie*, but the experience of Germany proved that it may be a powerful element in the constitution of one. It was

¹ *L'Empire libéral*, i., p. 164.

not enthusiasm for the abstract rights of man which bound together the old provinces of France in a sense of common nationality; it was the economic gains of the Revolution, the creation of a prosperous nation of *bourgeois* and of peasant proprietors, that made the *patrie*. It needed the passion of Mazzini and Garibaldi for an ideal Italy to rouse the Italians to throw off the yoke of an oppressive and alien system, but it was the long prosaic labours of Cavour that laid firmly the economic basis of Italian unity. Instances, indeed, might be multiplied to show that, whatever may be the constituent elements of nationality, it is only a strong sense of common material interests that can create and maintain a nation. It is certainly no mere coincidence that the development of the principle of nationality during the 19th century kept pace with the vast economic changes produced by the industrial revolution.

The factor of sentiment is not, of course, excluded; but the sentiment of nationality is not a thing apart, or especially holy. It is, as Mr. A. J. Balfour has pointed out, but one of a group of such sentiments for which there is no common name. Man is a gregarious animal; he has the group instinct; and this implies also the instinct of self-sacrifice for the sake of the group—*esprit de corps*, the civic sense, local or national patriotism. All human associations are directed to some common good, and from the point of view of the group sentiment it matters little how this good is conceived—whether as material or spiritual. A trade union is an association for a purely economic purpose; but it demands self-sacrifice on the part of its members, and it certainly develops a strong sense of *esprit de corps*. To say, then, that the strongest and most permanent bond of a nation is the sense of common interests is not to belittle the value of loyalty to a national cause.

The modern world has become so accustomed to hearing of nationality as the basis, or the only sound basis, of the state that it is apt to forget how very recent is this conception, which for many people is rooted in the very nature and justice of things. The sentiment of nationality is of course very ancient; it is indeed (as the Latin word *natio*, from *nasci*, "to be born," implies) a natural development of the sentiment of the family and the tribe. But this sentiment was, until comparatively recently, not consciously associated with any conception of the state as we understand the term. The ancient Greeks were strongly conscious of their common Hellenism, but their political unit was the city state; there was a Greek people, but no Greek nation. The Roman Empire, which, as it were, flattened out national differences throughout the civilized world, was in essence the expansion of the city state; it was in no sense "national," even from the point of view of the Romans. The Middle Ages, which inherited the Roman tradition, recognized nationality, but not as the constituent principle of bodies politic. The voting in general councils of the Church was by "nations," but these had so little to do with the conception of states that it was not until the Council of Constance, in 1414, that a fourth nation was added to the Italians, the French and the Germans—the English, who had hitherto been included among the Germans. Yet so early as the 11th century the poet of the *Chanson de Roland* celebrates "French" valour and puts into the mouths of his warriors praises of "sweet France," and in the next century the German minnesingers are denouncing "welsh" arrogance and exalting German nationality. Yet there was so such thing as a national state, the root reason being that the material basis of society was feudal, that is to say, determined by the ownership of land—the only stable form of wealth then existing—and by an elaborate system of reciprocal services and obligations which took no account whatever of the frontiers of nationality. With the growth of the fenced cities, and of the commerce of which they were the centres, the feudal system gradually decayed. But the monarchies which rose upon its ruins had still for the most part a purely territorial basis, and so continued as long as landownership gave the strongest title to wealth and power, that is to say, until the beginning of the 19th century. The industrial revolution, with the vast impetus it gave to international commerce and the new self-conscious

classes it created, sapped their foundations. Artificial boundaries became a nuisance, and the German *Zollverein* was the beginning on a large scale of a process of economic concentration, segregation and exclusion which has continued ever since, and is likely still to continue. To say that it is economic pressure which has largely determined the formation of nations is not to pretend that the economic vision of peoples is always clear. The group instinct sometimes defeats its own ends. The disappearance in 1918, for instance, of the last of the great purely territorial monarchies, Austria-Hungary, destroyed an economic unit of the greatest importance to all its constituent countries. It used to be said that if Austria did not exist, Austria would have to be created. This was from the political point of view. From the economic it was true still.

National Expansion.—"If men had any strong sense of the community of nations," says Bertrand Russell, "nationalism would serve to define the boundaries of the various nations. But because men only feel community within their own nation, nothing but force is able to make them respect the rights of other nations, even when they are asserting similar rights on their own behalf" (*Principles of Social Reconstruction*, p. 33). The truth of this is revealed in the whole history of the last hundred years. The Magyars, after securing their own liberty by a gallant struggle, proceeded to force their own national ideals on the races subject to them. The Germans, welded into a great nation by "blood and iron," embarked on a policy of conquest beyond their own borders. The Italians, when they had liberated themselves from the Germans, aimed at recapturing the "national frontiers" of Italy, though this involved the attempt to absorb alien populations, and even began to dream of reestablishing the Mediterranean empire of Rome. The Poles, reunited after a century and a half of agony, scarcely waited for the ink on the Treaty of Versailles to dry before starting on the great adventure of reconquering their frontiers of 1772. Even Bolshevik Russia, wicked fairy godmother of the bantling "self-determination," showed little disposition to allow her outlying provinces to determine themselves. The Sinn Feiners in Ireland passionately claimed self-determination for themselves, but equally passionately resented its application to the solid minority in Ireland concentrated in north-east Ulster when they too demanded it.

All this, though lamentable from the point of view of self-determination considered as an instrument of peace, is merely the natural outcome of this principle considered as the expression of group selfishness. If the national group is bound together by a vivid sense of common and exclusive interests, sooner or later it will seek to expand, if it is a healthy organism and thus subject to the ordinary laws of growth. German political theory before the World War conceived of the national group as such an organism, and as subject to the universal law of the struggle for existence and the survival of the fittest. "A cessation of growth," said Paul Rohrbach in his *Der Deutsche Gedanke*, "would be for us a catastrophe both internal and external, for under our present conditions it could not possibly be natural or voluntary, but would only happen when another people or combination of peoples should hurl us to the ground in such a way as to make us infirm for a long while to come." "In every great nation," he says again, "the instinct of self-preservation reveals itself in the form of a natural pressure to expand, which only finds its frontiers where it meets other national-political counteracting forces strong enough to resist it." From the ideal point of view this "doctrine of conquest" is, of course, wholly evil and misguided. From the strictly scientific point of view, judged that is to say by the experience of the past and even of the last few years, it must at least be treated with respect. To this world-old doctrine of conquest, reinforced by the new spirit of national exclusiveness, the new doctrine of democratic self-determination, combined with a new organized spirit of international good-will, is prescribed as an antidote. How far is it likely to prove effective?

Self-determination and Peace.—The advantage of the old unnational conception of the state was that it offered no rigid

barriers to the economic expansion of the nationalities, in so far as these existed outside the political sphere, the overflow of a nationality in one state percolating, or occasionally flooding, into another without any sense of inconvenience to the state invaded, which merely received a very often welcome addition to the number of its subjects. In the days before the industrial revolution these transferences of population were, indeed, more often determined by other than economic causes. Thus in the 17th century some 30,000 Slav and Albanian families migrated into the Habsburg dominions, Slavonia and southern Hungary, in order to escape the fury of the Turks; Flemish and French Protestants fled in thousands to the British Islands; and the Electors of Brandenburg peopled their waste spaces with Huguenot refugees from France and Protestant refugees from southern Germany. In the industrial age the migrations took another form. German industrial expansion demanded a vast supply of cheap labour, and this was provided by a mass immigration of Slavs, which created misgiving even when the German Empire was supremely powerful.¹ Little misgiving was created, on the other hand, by the still vaster immigration of all the less developed nationalities of Europe into the United States and, later, into the British Dominions. The process, indeed, was in itself unobjectionable so long as the migrating masses carried with them no conscious sentiment of nationality in a political sense, and no claim to assert themselves as separate entities, i.e. so long as allegiance was conceived as due not to the nationality but to the state. It is quite another thing when, under the principle of self-determination, the balance of nationalities in any given state becomes a matter of vital importance to the state itself. The Emperor Leopold I. would hardly have given special privileges to the Slavs who sought refuge in his dominions had he foreseen that this migration would lead, some 200 years later, to the downfall of the Habsburg Empire and dynasty. The danger of similar consequences is increased when the constitution of the state itself is made dependent upon a popular vote, and all the signs point to the fact that self-contained nations will no longer permit promiscuous immigration—the United States has set the example by "tightening up" its immigration laws—and will be increasingly intolerant of national divergencies within their own borders. The effect of the principle of self-determination, logically applied, would therefore be to establish the nationalities as jealously segregated nations, probably surrounded by tariff walls, certainly defended against dangerous infiltration of alien elements from without by rigid rules as to naturalization, and earnestly bent on reducing all within their borders to the same national model. The danger to peace of attempting to confine the expansive forces of nationalism within such artificial limits is obvious, and the danger will not be avoided by the creation of an international force, such as the League of Nations, charged with the duty of preserving the *status quo* or of readjusting it according to the ebb and flow of the national life of the several communities; for the pressure of the forces of expansion of vigorous nationalities, artificially restrained, would blow the League to pieces.

It may be that the economic development of the world, by increasingly demonstrating the interdependence of nations, will reduce the sentiment of nationality to the position it occupied during the long ages when it was not the basis of the state, still less an intolerant crusading power. But the World War at least proved that the international movement associated with labour, disfigured as it was by its insistence on the necessity of a new form of war—that of class against class—was powerless against the passion of nationality. The true hope of peace for the future lies in the recovery by the world of the idea of the state, whatever form it may take, as a thing apart from and above the idea of nationality and infinitely tolerant of national divergencies. It is the ideal towards which the British Empire has been consistently tending. The ideal League of Nations will be some such loose confederation, embracing all the world, of which each constituent state, while guarding its own interests, will realize that these interests are bound up with those of the totality of

¹ See a remarkable series in the *Frankfurter Zeitung* in 1911.

states. For such a universal union, however, the world is not ripe; for there are peoples who are not yet capable of self-government, and will only become so, if ever, by a long process of education. To talk of self-determination for such peoples is a mockery. It is also a wrong; for, as Senator Elihu Root wisely said with reference to the Philippines, "the right to government is prior to the right to self-government."

See W. Alison Phillips, "Europe and the Problem of Nationality," *Edinburgh Rev.* for Jan. 1915, of which parts are incorporated in the above article; J. W. Headlam-Morley, "Plebiscites," *Quarterly Rev.* for July 1921 (No. 468); Sarah Wambaugh, *A Monograph on Plebiscites, with a collection of Official Documents* (1921); *Plebiscites*, vol. xxv. of the Peace Handbooks issued by the Historical Section of the Foreign Office (1920); *A History of the Peace Conference of Paris*, edited by H. W. V. Temperley (3 vols., 1920). Among more modern foreign works on the subject are Schallmeyer, *Verehrung und Auslese im Lebenslaufe der Völker* (1903); Kirchhoff, *Zur Verständigung über die Begriffe "Nation" und "Nationalität"* (1905); Otto Bauer, *Nationalitätenfrage und die Sozialdemokratie* (1907).

SELOUS, FREDERICK COURTNEY (1851–1917), English explorer (see 24.614), in 1909 organized Mr. Roosevelt's hunting expedition in East Africa, and in 1910 represented Britain at the Congress of Field Sports held at Vienna. In Aug. 1914 he offered his services to the War Office, but they were declined on account of his age (he was over 62). Persistence, however, gained him a subaltern's commission (Feb. 1915) in the Legion of Frontiersmen (25th Fusiliers) and he reached Mombasa in May following. Selous took part in many engagements in the East African campaign, was promoted captain and (Sept. 1916) given the D.S.O. He was killed in action at Beho Beho on Jan. 4 1917 (a year after his eldest son had been killed on the western front). His private collection of trophies was given by his widow (Mary Maddy, whom he married in 1894) to the Natural History Museum, London, where in June 1920 a national memorial to him was unveiled—a bronze half-figure by W. R. Colton—a Selous scholarship being also founded at his old school, Rugby.

See J. G. Millar's *Life of Frederick Courtney Selous* (London 1918), and *Geog. Jnl.*, vol. xlix. (1917).

SENUSSI AND SENUSSITES (see 24.640).—The military activity of the Senussi from 1900 to 1910 had been directed against the advance of the French in the regions bordering the Sahara between Lake Chad and the Nile basin. There was evidence of an

THE SENUSSI COUNTRY

increase of adherents to the sect in Egypt and in Arabia; in N.W. Africa and in the Anglo-Egyptian Sudan Senussiism made practically no headway.

Activity in Cyrenaica.—While continuing hostilities against the French, the Senussi sheikh Sayed (Sidi) Ahmad esh Sherif in 1911 aided the Turks in Cyrenaica, then commanded by Enver Bey (later Pasha) in the campaign against Italy. The traditional policy of the Senussites was one of suspicion in regard to the Turks but they had been won over by Pan-Islamic propaganda. By the Treaty of Lausanne, Oct. 1912, the Turks agreed to evacuate Tripoli and Cyrenaica. At that time the Italians held only the chief seaports of Cyrenaica, the rest of the country being in the military occupation of the Senussites and their allies. Sidi Ahmad continued the war with Italy, aided by a body of Turkish troops, which, contrary to treaty engagements, remained in Cyrenaica. The Italians devoted their attention to the occupation of the hinterland of Tripoli (including Fezzan), a process completed in Aug. 1914. In Cyrenaica they remained mainly on the defensive. General Ameglio, appointed governor of Cyrenaica towards the end of 1913, had however begun a vigorous campaign against the Senussites, when in Feb. 1914, in consequence of the threatening situation in the Balkans, orders were issued from Rome to suspend operations.

When the World War began, and while Italy still remained neutral, Turkish agents, with German support, sought to make Cyrenaica and Tripoli bases of action against the French and British. To the tribes which rose in revolt in Tripoli and its hinterland the Senussites gave some support, but Sidi Ahmad, through the intermediary of chiefs friendly to Italy, was conducting unofficial negotiations, and had the Italians been willing to acknowledge his independence an accommodation with them might have been reached. He refused however to accept the position of "a protected Bey." By the spring of 1915 he was again attacking Italian posts. Strong efforts had been made for some time by the Turks and their German advisers to induce the Senussites to invade western Egypt; a special Turkish mission now visited Sidi Ahmad and endeavoured to get him to proclaim a *jihad*. The Senussi sheikh was disinclined to take the advice offered him. The Senussites had always maintained good relations with Egypt—for much of their trade they were dependent upon the good-will of the Egyptian authorities. It was the demonstration that the Turco-Germans could give him substantial military and financial aid which finally changed Sidi Ahmad's views. A large number of Turkish officers and some Arabic-speaking German officers from the German garrison at Constantinople were smuggled into Cyrenaica, a matter of little difficulty. Among the arrivals was Nuri Bey, a half brother of Enver Pasha who exercised much influence. Nuri was joined in April 1915 by Ga'far Pasha, an Europeanized Arab of considerable ability, and with and after Ga'far came arms, ammunition and other stores, including wireless and telephonic apparatus.¹ By Aug. 1915 the Germans were using the landing places between Sollum and Tobruk as submarine bases. The time for putting the Turco-German plans into operation was approaching. These plans were, mainly through Senussite instrumentality, to threaten at once French north and central Africa, Nigeria, Egypt and the Anglo-Egyptian Sudan. It was also designed to penetrate to Cameroon and establish land communication between the Mediterranean and the Gulf of Guinea. The German Emperor, as "Islam's Protector," exhorted Sidi Ahmad to "expel infidels from territory which belonged to true believers." But besides the Senussi sheikh the only important chief won over to the cause was 'Ali Dinar, Sultan of Darfur, a tributary state of the Anglo-Egyptian Sudan, and the plan failed.

French determination to secure their position in the central Sudan contributed largely to the localization of the conflict. In 1900-10 the French had conquered Wadai (see 28.225), which adjoins Darfur, thereby withdrawing from the Senussite sphere a country in which they had been all powerful. In 1913, pushing N. from Kanem into the Saharan borderland, Colonel Largeau conquered Borku, capturing 'Ain Galakka, the Senussite south-

ern base, in November, of that year. In the middle of 1914 Bardai, the chief settlement in the Tibesti highlands, was occupied.² These newly conquered regions on the southern fringe of the Libyan Desert were placed under the control of Lt.-Col. J. Tilho. Though risings against their authority by chiefs acting on Senussite instructions, and raids by nomads continued up to the early months of 1917, the French posts formed an effective barrier against any Senussite advance into central Africa.

Campaign in Western Egypt.—Since May 1915 the danger of a Senussite invasion of western Egypt had existed. It was due to the great tact with which Lt.-Col. C. L. Snow,³ who commanded the small force stationed in western Egypt, handled a very delicate situation that the rupture with the Senussites was delayed till Nov. 1915. At the last moment, early in November, a final effort was made to avoid a break, Sidi Mohammed el Idris, Senussite envoy in Egypt, being sent to Cyrenaica to arrange for the Senussi sheikh "to get rid of his Turkish advisers in return for a sum of money." It was too late; Sidi Ahmad was already well supplied with German gold as well as arms.

The enemy plan of campaign was to advance in parallel lines with two forces, one across the Libyan plateau,—a great limestone tableland—the other farther S. along the string of oases leading from Siwa to the Nile. Simultaneously the Sultan of Darfur was to rise in revolt, invade Kordofan and advance on Khartum. The plan was boldly conceived, but the danger to Egypt and the Sudan was not chiefly in the military force at the command of the Senussi sheikh and his allies. That danger lay in the spiritual authority exercised by Sidi Ahmad and the high prestige he enjoyed in Egypt. Many if not most of the 200,000 Bedouins of western Egypt were adherents of the Senussi sect and should the Senussi forces gain any striking success it "might lead to serious religious and internal disorders." So wrote Gen. Sir John Maxwell, then commanding the forces in Egypt, who added that the Senussi peril was his principal source of anxiety—not the Turkish attack on the Suez Canal.

The opening of the campaign was accompanied by great activity by German submarines off the Cyrenaican coast and in the Gulf of Sollum; among the boats sunk were the British auxiliary cruiser "Tara" and the horse transport "Moorina." Survivors of the crews were handed over to the Senussi and suffered great privations (Cyrenaica is a very desolate country and the Senussites themselves were often short of food). Land hostilities began on Nov. 15 but in view of the isolation and smallness of the Egyptian garrisons at Sollum and other advanced posts they were withdrawn, and a stretch of country 200 m. or more in length was at once overrun by the Senussites. They advanced as far as Dabya (90 m. W. of Alexandria and the terminus of the railway along the coast), sweeping past, but not attacking Mersa Matruh, the chief port of western Egypt and reached by boat from Alexandria in 12 hours. This port was made the base for the British operations.

General Maxwell's endeavour, in view of the internal situation, was to avoid anything in the nature of a reverse, to keep the enemy as far as possible from the Nile valley, and, as soon as possible, to strike a decisive blow at the Senussi and by his defeat to diminish his influence as a spiritual potentate. These aims were achieved, but at the outset the difficulty was to get together a force strong enough to undertake operation. In Aug. 1915, when the situation on the western Egyptian frontier became critical, the Gallipoli campaign was being vigorously prosecuted, while the Turks had again advanced towards the Suez Canal. When the Senussi invasion occurred the decision to evacuate Gallipoli had not yet been taken, while the British Government had just committed itself to the Salonika campaign. In these circumstances Sir John Maxwell had to content himself with collecting a "scratch" force to oppose the Senussi. The strength

¹ Turkish troops had occupied Tibesti in 1910 and Borku in 1911. They were recalled at the outbreak of the war with Italy.

² Col. Snow was killed in the first action (Dec. 11 1915) by an Arab whom he was endeavouring to persuade to surrender. He had served over 20 years in the Egyptian coastguard and was intimately acquainted with the desert tribes.

³ The German political agent was a certain Mannismann, who after the defeat of Sidi Ahmad endeavoured to persuade the Senussites to continue the war. He was attacked and killed in the desert by the men hostile to Ahmad.

of the Senussi is conjectural. The Turkish troops with them may have numbered 1,000; the *Muhafizis* or Senussite regulars were perhaps 5,000 strong. In addition there was an irregular body of tribesmen, Arabs and Arabized Berbers, probably numbering 20,000, all well armed and accustomed to desert warfare, but undisciplined and untrustworthy. The Senussites were well supplied with rifles and small-arms munitions; they had field guns and machine-guns; they had an ample camel transport and many of their troops were well mounted. With them were about 100 Europeans; Ga'far Pasha was commander-in-chief, and was accompanied by Sidi Ahmad and Nuri Bey.

Through bad leadership, or from other causes not explained, the Senussi offensive was not carried out as planned. When the advance across the Libyan plateau was made, Siwa oasis was also occupied; but no further progress towards the Nile by that route was then attempted. Moreover, 'Ali Dinar of Darfur, who had formally renounced his allegiance to the Sudan Government in April 1915, while preaching a *jihād* and indulging in abusive letter writing,¹ did not carry out his threat of invasion. Thus at the outset the British had to deal only with the enemy advance along the Mediterranean coast.

Orders for the formation of a Western Frontier Force were issued on Nov. 20. Maj.-Gen. A. Wallace, who was given the command, took up his headquarters at Matruh on Dec. 7. His troops consisted of Yeomanry, Territorials, Australians, New Zealanders, Indians and Egyptians, with a squadron of armoured cars and a squadron of aeroplanes. The striking force was a composite mounted brigade under Brig.-Gen. J. D. T. Tyndale Biscoe and a composite infantry brigade under Brig.-Gen. the Earl of Lucan. "Regiments and staff had been collected," wrote Sir John Maxwell, "somewhat hastily. . . . The composite yeomanry brigade contained men from 20 or more different regiments. . . . It was not until the middle of Feb. (1916) that the condition of the Western Frontier Force could be considered really satisfactory."

The Senussites were engaged on Dec. 11 and 13 in the neighbourhood of Matruh with indecisive result. Having received reinforcements, General Wallace again engaged the enemy, on Christmas Day, at Gebel Medwa, a few miles from the coast. The Senussites, severely handled, retreated to Halazin (officially misspelt Hazalin), 25 m. S.W. of Matruh. Torrential rains now interrupted operations; in any case General Wallace was too weak to resume the offensive until further reinforced. The first of these new reinforcements consisted of the 2nd Regt. of the 1st South African Infantry Brigade, which disembarked at Matruh on Jan. 20 and 21 1916. They were the first S. Africans from the Union to take part in the war outside the limits of S. Africa.² On Jan. 23 the Senussites were attacked at Halazin and after an eight-hours' stubborn engagement were defeated and fled. The country had been turned by the rains into a quagmire and mud played an important and unfortunate part throughout. General Wallace's successes now induced many of the Egyptian Bedouin (mostly the Walad 'Ali tribesmen) to desert the Senussi cause. Wallace had been tied to his base at Matruh by lack of sufficient camel transport, but by February this difficulty was overcome and the force had been further strengthened, partly by more South African infantry. The time for a real offensive had come. At this period General Wallace resigned and was succeeded by Maj.-Gen. W. E. Peyton (Feb. 9 1916).

On Feb. 20 General Peyton sent forward a force under Brig.-Gen. H. T. Lukin (commander of the 1st S. African Inf. Brig.) with orders to take Barrini, 50 m. E. of Sollum. On the 26th an engagement was fought at Agagia, in which Ga'far Pasha attempted to carry out his favourite manoeuvre—an enveloping movement. This movement was checked, the infantry pressed forward and after a two-hours' struggle the Senussites were compelled to evacuate their position. The yeomanry were then sent in pursuit, and the Dorset Regiment (under Col. H. M.

Souter) in a fine charge broke into the enemy lines and captured Ga'far Pasha.³ Nuri Bey took over the command of the Senussi forces, which offered little further resistance. Two British columns advanced on Sollum, which was reoccupied on March 14; Sollum is close to the Cyrenaican frontier and into Cyrenaica, that is into Italian territory, Nuri Bey and his forces retreated after blowing up their main ammunition dump. General Peyton did not further pursue Nuri, but on March 17 a squadron of armoured cars, under Major the Duke of Westminster, raced 120 m. across the desert and rescued the survivors—some 90 in number—of the "Tara" and "Moorina." Shortly afterwards General Peyton's force was reduced, the S. Africans leaving in April for France.

Sidi Ahmad had been with Ga'far Pasha until the end of Jan. 1916. He then went to Siwa and began the advance along the oases that lead to the Nile. The advance came too late to be effective, but on Feb. 11 Senussites occupied Baharia oasis, some 100 m. from the fertile and densely peopled districts of Fayum and Minia. Before the end of February the Senussites had also occupied the more southerly oases of Farafra and Dakhla. Thereupon the Egyptian officials were withdrawn from Kharga (the Great Oasis), which is connected by railway with the Nile valley, and the Senussites proceeded to occupy it. The strategical importance of the oases is great, but having no troops available for an offensive in S.W. Egypt, General Maxwell took defensive measures only. A command under Maj.-Gen. J. Adye patrolled the region from the Fayum to Assiut and Esna. The oases were kept under constant observation by aeroplanes, and the Senussites did not emerge from them. After the complete defeat of their northern force they abandoned Kharga, which was reoccupied by the British on April 15 1916. Gen. Sir Archibald Murray had meanwhile (March 19) succeeded General Maxwell in the Egyptian command.

Darfur Campaign.—At this period, in the Sudan, the Sirdar, Gen. Sir Reginald Wingate, was dealing with 'Ali Dinar of Darfur. For over a year the Sultan had been openly defiant and since Dec. 1915 had been making arrangements to invade Kordofan. As the Sudan Government had not in 1915 any force available for action in Darfur, negotiations were entered into with him, but without result, and the belief grew in the Sudan that the Government was too weak to deal with so powerful a sultan ('Ali Dinar had a regular "slave" army some 20,000 in number, for the most part well armed). Early in 1916 it had become imperative to clear up the situation if the general peace of the Sudan was to be preserved. Though it was the worst season of the year for military operations the Sirdar determined to anticipate 'Ali Dinar's offensive. An expeditionary force, 3,000 strong, was organized under command of Maj. (temporary Lt.-Col.) P. V. Kelly. Except for a detachment of the R.F.C. the troops consisted entirely of units of the Egyptian army—this being the first time since the *Mahdīa* that Egyptian troops had fought Sudanese Arabs. The expedition was highly successful. It was remarkable for the manner in which transport difficulties were overcome. Khartum, the base, is 500 m. by rail from the nearest seaport: El Obeid, railhead, is 428 m. from Khartum; and from El Obeid the force had to advance nearly 400 m. across a desolate roadless country. It then had to engage a numerically superior enemy of indomitable valour. Battle was given by the Darfurians on May 22 (1916) at Beringa, near El Fasher, 'Ali Dinar's capital. A body of 2,000 riflemen, supported by a large mounted force, attacked the Egyptians with all the accustomed bravery of the Dervish warrior. They were beaten back, counter-charged and completely defeated, losing

¹ Like many other Arab officers and men in the Turkish army who fell into the hands of the British, Ga'far Pasha joined the Arab forces under the Emir Faisal and took part in the Syrian campaign against the Turks. After his capture at Agagia he had been confined in the citadel at Cairo. He tried to escape by means of a rope. Ga'far being a very heavy man, the rope broke; he fell, injured himself, and was removed to hospital. While there, he learned of the Sherif of Mecca's revolt and resolved to join his forces. In 1920 he became Minister of Defence in the Provisional Arab Government of Mesopotamia. He was a delegate at the Near East Conference held in Cairo in March 1921.

¹ He addressed one letter to "The Governor of Hell in Kordofan and the Inspector of Flames in Nahud."

² A volunteer force raised in Rhodesia (the 2nd Rhodesian Regt.) had gone to E. Africa in 1915.

over 50% of their number in killed alone. 'Ali Dinar and a considerable following of horsemen fled from the field. The party was chased and bombed by airmen, but the Sultan made good his escape. He retired to the confines of French central Africa. In Oct. 1916 a column was sent against him; he again fled, was pursued and killed in action on Nov. 6.

The Siwa Defeat.—In the oases west of the Nile (where Maj.-Gen. W. A. Watson had taken over the command) there was little change between April and Oct. 1916. The patrolling of the desert front, over 800 m. in length, was done by light motor-cars, the Imperial Camel Corps and aeroplanes. In October, the British, with slight opposition, reoccupied Dakhla oasis, where Sidi Ahmad had a farm and where he had been living for some months. From Dakhla a daring attempt was made by a party of British, in motor-cars, to reconnoitre Kufra, but it was found impossible to cross the belt of sand dunes west of the oasis.

Sidi Ahmad now retired by way of Farfara and Baharia oases to Siwa. As long as he remained there he was not utterly discredited in the eyes of the Egyptians. It was therefore decided to attack Siwa with a force sent in motor-cars from Matruh. The distance to be covered was 150 m., but the ground was for the most part hard. Leaving Matruh on Feb. 1 1917, the armoured-car force, under Brig.-Gen. H. W. Hodgson, reached the escarpment, below which lies Siwa oasis, the next afternoon, and was in action the whole of Feb. 3. The Senussites were about 1,000 strong, including 800 riflemen, and had mountain and machine-guns. An attempt to rush the cars was frustrated, but the action appeared to be indecisive. However, at daybreak the next morning the Senussites, having blown up their ammunition, retreated west. The head of their column was ambushed, but the main body got away. Sidi Ahmad, with Mohammed Salih (ex-commander of the Egyptian coastguard, who had deserted at the beginning of the campaign), had already fled to Jarabub (the oasis in which is the mosque-tomb of the founder of the Senussite fraternity). Thither he was not pursued, and in the Kufra oases he had a practically inaccessible place of refuge.

Nevertheless, with the defeat of Siwa the danger to Egypt from the Senussi movement disappeared and though raids were made on the Darfur border they did not seriously affect the Sudan. In Cyrenaica, too, the situation was altered. An Anglo-Italian agreement had been concluded in July 1916 for common action against the Senussi and it was in contemplation to transfer from the Egyptian to the Italian sphere Jarabub and that part of the Libyan Desert containing Kufra.

An Understanding with Italy.—During 1917 and 1918 Turkish and German influence among the Senussites steadily declined while strong efforts were made by the Italians to come to an understanding with the sect. They secured the release of 700 Italian soldiers, prisoners of war. Sidi Mohammed el Idris, the former envoy to Egypt, and the eldest son of Senussi el Mahdi, had disapproved his cousin's action and had taken no part in the invasion of Egypt. He had an influential following and was desirous of peace with both Italy and Great Britain. After the fight at Siwa he entered into an agreement with both Powers. Sidi Ahmad himself was deeply committed to his Turkish and German counsellors. Many of these, including Nuri Bey, had left Cyrenaica. In the summer of 1918 the Idrisi party gained the mastery in the Senussite ranks. Sidi Ahmad's position was undermined and he found it convenient to quit Cyrenaica. In August of that year he was conveyed by a German submarine from Misurata to Polo, whence he went to Turkey, still claiming to be the head of the brotherhood. In 1919 he "girded the Sultan with the sword of 'Othman" but in 1920 had turned Nationalist and aided Mustafa Kemal.

The Senussi chiefs in Libya had chosen Sidi Mohammed el Idris as Grand Senussi, and the new head of the order in Jan. 1919 sent a mission to Rome, when Italian sovereignty was implicitly recognized. Neither Italy, France or Great Britain had challenged the right of the Senussi sheikh to exercise spiritual authority over the members of the brotherhood; Italy in 1917 had gone further and had acknowledged Sidi Mohammed's temporal authority in what may be called his hereditary domin-

ions. By the accord of Regima concluded Nov. 1920 the 1917 agreement was ratified and Sidi Mohammed, to whom the Italians gave the title of emir (prince), himself visited Rome to pay homage to the King of Italy. An indication of Sidi Mohammed's attitude was the permission he granted at this time to an English woman to visit Kufra, though in the guise of a Moslem. The lady in question, Mrs. Rosita Forbes, testified to the desire of the Senussi chiefs to resume trade with Egypt.

(F. R. C.)

SERBIA (see 24,686) had in 1910 an area of 48,303 sq. km., which after the Balkan wars was increased to 87,358 sq. kilometres. The pop., according to the census taken on Dec. 31 1910, was 2,911,701, showing an increase of 417,931 over that of 1900. The country was divided into 18 districts, as follows, (the pop. is shown in brackets):—Belgrade¹ (155,815), Belgrade City (89,876), Valjevo (157,648), Vranja (252,937), Kragujevac (189,025), Kraljina (112,142), Kruševac (167,371), Morava (203,638), Niš (108,768), Pirot (112,314), Podrina (238,275), Požarevac (259,906), Rudnik (85,340), Smederevo (143,216), Timok (140,538), Toplica (110,216), Užice (146,763), Čačak (138,911). Of this total pop. 2,528,819 lived in the country, and only 382,882 in towns. Of these the most populous were Belgrade (89,876), Niš (24,949), Kragujevac (18,452), Leskovac (14,236), Požarevac (13,411), Šabac (12,100), Vranja (11,439), Pirot (10,737). In 1900 the density of population was 51.6 per sq. kilometre.

The territory acquired by Serbia in the wars of 1912-3 contained (according to not very reliable statistics) a pop. of 1,481,614, divided among the following 12 districts:—Prijepele (49,315), Raša (81,214), Zvečane (81,643), Kosovo (193,337), Prizren (124,101), Tetovo (146,803), Skopje (Uskub, 157,078), Kumanovo (144,983), Bregalnica (101,442), Tikveš (84,657), Bitolj (Monastir, 252,646), Ohrida (84,395).

Thus Serbia on the eve of the World War had a pop. of roughly 4,500,000. The births, deaths, and marriages in Serbia amounted in 1911 and 1912 to 107,219 and 114,257, to 64,369 and 63,358, and to 30,420 and 13,289 respectively.

Agriculture.—Serbia is a land of small holdings, the former Turkish proprietors having been expropriated in 1833 and 1880: in 1900, out of a total of 401,093 families, no less than 91.5% were owners of land. Of these only 86 persons owned over 100 hectares of land, and only three persons over 300, while there were 98,253 properties (33.4% of under three hectares. There has been a very rapid development of co-operative societies since 1895 (900 in 1909, with 35,000 members; 1,200 in 1913, with 40,000 members).

Of a total area of 2,045,176 hectares there was in 1905 (a) cultivated land 1,223,671 (arable land 1,027,815, gardens 25,815, vineyards 33,101, orchards 136,939); (b) grazing land 418,391; (c) commons and uncultivated land 110,101. In 1908 the chief products of the harvest were (in tons) maize 533,691, cereals 457,734, hay and clover 226,858, straw 777,728, plums 530,061, potatoes 54,946. In 1905 (latest statistics available) the live stock was distributed as follows: horses 174,363, cattle 969,953, pigs 908,580, sheep 3,160,160, goats 510,063.

Forests.—Over one-third of Serbia's total area (3,750,000 ac.) is forest land, all but 750,000 ac. of this belonging to the State or the various communes. The chief varieties of tree are beech (750,000 ac.), oak and conifers.

Mines.—The mining industry of Serbia has a great future, but has hitherto been but little developed, owing to lack of capital and means of transport. Table 1 gives the export of ores (in metric tons) according to the last statistics available. That these are merely the first primitive beginnings is best shown by the fact that in the year

¹ The phonetic spellings of the names of the districts and towns, following the system adopted by the Committee of the Royal Geographical Society, are: Belgrade, Valjevo, Vranja, Kragujevac, Kraljina, Kruševac, Morava, Niš, Pirot, Podrina, Požarevac, Rudnik, Smederevo, Timok, Toplica, Užice, Čačak, Leskovac, Šabats, Prijepele, Raša, Zvečane, Kosovo, Prizram, Tetovo, Skopje, Kumanovo, Bregalnica, Tikveš, Ohrida. The spellings given above follow the Croatian form or its equivalent.

TABLE 1.—Exports of Ore.

	1904	1906	1908

Italy	93,800	145,798	121,864	42,786
Russia	77,294	72,925	815	541

of over 21,400,000 francs was exported. The famous plum industry (known to the west only through German intermediaries) accounted in 1908 for the export of 49,042 tons of prunes (value 10,350,721 francs) and of 14,398 tons of plum jam (value 3,251,093 francs). The pig trade, upon which Serbia's prosperity very largely depended, having been injured by Austria-Hungary's tariff policy, a new system of slaughter-houses was established in Belgrade, and in 1911 the chief of these exported 9,751 tons of pork (68,047 head). By 1913 the amount exported had risen to 12,913 tons (100,776 head).

Finance.—On Jan. 1 1913 the public debt amounted to £26,362,240. Table 4 shows how the budget balanced in the years before the war. In 1915 the budget was fixed at the same figure. From 1915 to 1918, owing to the conquest of the country, no proper budget was possible, the Government and army subsisting upon the subsidies of the Allied Powers.

TABLE 4.—Finance.

	Revenue	Expenditure	Surplus
1909	£4,145,764	£4,132,945	£12,818
1910	4,611,109	4,602,913	8,196
1911	4,805,458	4,803,272	2,186
1912		4,972,758	
1913		5,230,588	
1914		8,572,826	

Education.—In 1909 there were only 1,296 elementary schools in Serbia with 2,584 teachers and 138,434 pupils, and 20 secondary schools with 393 teachers and 7,317 pupils. In 1910-11 the university of Belgrade had 1,025 students. Only 27% of the pop. could read and write.

Army.—After 1908 great efforts were made to increase the efficiency of the army. Organized under a system of obligatory service, the war strength in 1914 was estimated at 350,000 men, which, with the addition of the Landsturm, could be raised to about 400,000. (See ARMY: Balkan Armies.)

POLITICAL HISTORY, 1909-18

The annexation of Bosnia by Austria-Hungary in 1908 marked a turning point in the history of Serbia. Henceforth public opinion, supported by prominent statesmen in every party, was practically unanimous in regarding a conflict with Austria-Hungary as sooner or later inevitable. This belief had at once a national and an economic basis: for Count Aehrenthal not merely supported the Hungarian policy of repressing Yugoslav national aspirations inside the Dual Monarchy, but obstructed Serbia's commercial development by tariff and frontier restrictions, by a veto upon either direct access to the sea or a common frontier with Montenegro, and by opposition to all idea of Balkan coöperation. Those Serbs who feared so unequal a conflict

and would have preferred a more conciliatory attitude towards Austria-Hungary, were reduced to silence by Aehrenthal's refusal to admit the international aspect of the problem or to consider the Serbian proposals for arbitration before the Hague Tribunal. Isolated in Europe and jealously shut off from her natural outlets on the Adriatic, Serbia was driven to seek new political and economic ties in the east and south. The policy of Aehrenthal inevitably strengthened the tendencies towards the creation of a Balkan League, and these were accelerated by the political unrest evoked throughout the Balkan Peninsula by the Young Turk Revolution.

The Balkan League.—The idea of a Balkan League was by no means new. It had been advocated as early as 1844 by the Serbian statesman Garašanin, and formed the subject of serious negotiations between Prince Michael Obrenović and the Bulgarian exiles of his day, and also between Kossuth, Prince Michael, and Prince Cuza of Rumania. The last serious overtures had been made in 1891 by the Greek premier Trikoupi, and after their betrayal to the Porte by Stambulov the idea remained dormant for nearly 20 years. The speech of the Russian Foreign Minister Isvolski on Christmas Day 1908, advocating a league between Turkey and the three Balkan Slav States, inaugurated a new era of Russian activity in the Balkans, under the active direction of Tcharikov, the ambassador at Constantinople, and Hartwig, who rapidly acquired great influence as minister at Belgrade. In the spring of 1910 the kings of Bulgaria and Serbia paid successive visits to St. Petersburg and Constantinople, and Dr. Milovanović, the Serbian Foreign Minister, was especially active in his endeavours to secure the adhesion of Turkey to a general Balkan League. His views were also shared by Venizelos, who came into power in Greece in October of the same year, and even to a lesser degree by Gešov, a Russophile, who became Bulgarian premier in March 1911. In view, however, of the increasingly chauvinistic attitude of the Young Turk regime in Macedonia and Albania, Venizelos considered it advisable to make overtures to Bulgaria, with a view to common defensive action against a possible Turkish attack. His initiative led to important secret negotiations, in which Mr. J. D. Bourchier, *The Times* correspondent, acted as intermediary. These preceded by at least five months the first conversations between Serbia and Bulgaria, which appear to have originated from an overture made by Rizov in Belgrade at the instance of King Ferdinand.¹ On Oct. 11 1911 Gešov, on his return from the west, had a long discussion with Milovanović in the train between Belgrade and Nish, and secret negotiations continued throughout the winter. The coming of age of Prince Boris of Bulgaria in Feb. 1912 was attended by the crown princes of Serbia, Montenegro, Greece and Rumania, and this demonstration was widely regarded as a symbol of increasing coöperation between the Christian States of the peninsula. On March 13 1912 a secret treaty of alliance was concluded between Serbia and Bulgaria, and was supplemented on May 12 by a military convention. On May 29 a similar treaty was concluded between Bulgaria and Greece. There was no actual treaty binding Serbia and Greece, while the Serbo-Montenegrin treaty, concluded as late as Sept. 1912, was less political than military and provided for separate though parallel action.

The Treaties.—By the terms of the Serbo-Bulgarian agreement each State was bound to assist the other with all its forces, in the event of an attack by one or more States unspecified, and in particular in the event of any Great Power trying to annex any portion of Turkey's Balkan possessions. If internal troubles should arise in Turkey, either ally might initiate proposals for military action, and any point upon which agreement was not reached, should then be referred to Russia for decision. Special provision was made for possible conquests, Serbia recognizing Bulgaria's rights over the territory lying east of the Rhodope Mountains and the Struma river, and Bulgaria similarly recognizing Serbia's rights north and west of the Šar (Šar) Mountains. The districts lying between these limits,

¹ See *Samouprava*, Oct. 28 1913.

the Aegean and the Lake of Okhrida, were to form "a distinct autonomous province"; but should their partition prove inevitable, then Serbia undertook to make no claim beyond a line drawn from the Lake of Okhrida to near Kriva Palanka on the old Turco-Bulgarian frontier and including Skoplje, but not Monastir, Prilep or Veles. In the event of a dispute, the Tsar was to act as arbitrator, and Bulgaria undertook to accept the more southerly line as its new frontier with Serbia, if the Tsar should decide in favour of the latter. In the event of war, Bulgaria undertook to place at least 200,000, Serbia at least 150,000, men in the field against Turkey. If either Turkey or Rumania attacked Bulgaria, Serbia was to send 100,000 men to her aid; while Bulgaria on her part must provide 200,000 men in support of Serbia, in the event of an attack by Austria-Hungary.¹ The treaty between Bulgaria and Greece was much more indefinite, though it provided for mutual aid against Turkey, not merely in case of direct military aggression, but also of the infringement of treaty rights and of the principles of international law—a phrase which was of course intended to cover the championship of co-nationals in Macedonia or Thrace against Ottoman misrule.

No attempt was made to define the territorial claims of the two countries in the event of a successful war, and the division of the spoils was thus left to the chance of a future agreement. The military convention was not concluded till Sept. 22, when events were already moving rapidly. By it Greece undertook to provide at least 120,000 men against Turkey, while Bulgaria increased the contingent already promised in her agreement with Serbia to 300,000 men. Special clauses provided for a blockade of the Aegean by the Greek fleet, and forbade the conclusion of peace or even of an armistice without the consent of all the allies.

The League, Turkey and the Powers.—Internal disorder had spread rapidly throughout Turkey in Europe in the year following Italy's invasion of Tripoli: and the ferocious policy of suppression adopted by the Committee of Union and Progress towards all the non-Turkish nationalities culminated in a reign of terror at the parliamentary elections of 1912, in a recrudescence of Komitaji activities, and in an Albanian rising even more widespread and more determined than in the two previous summers. The premature death of Milovanović on July 1 not merely deprived Serbia of her ablest modern statesman, but removed one of the few restraining influences in any Balkan capital. He was succeeded as premier by Trifković, and in the conduct of foreign affairs by the Old Radical leader Pašić, who placed almost unreserved reliance on Russian support and worked in the closest accord with Hartwig. On Sept. 12 Pašić became premier at the head of a purely Old Radical Cabinet.

By this time not even the most pacific statesmanship could have arrested the growing anarchy in Turkey. Public opinion in Belgrade and Sofia was roused by a massacre of Bulgarians at Kočana (Kochana) on Aug. 1, and by the report of similar outrages in the Sanjak. By the middle of the month, Uskub, and the entire district recognized by the secret treaty as Serbian, were in the hands of the insurgent Albanians; and the concessions granted by the Porte, while failing to arrest the movement, only served as an incentive to swift action on the part of the neighbouring States.

The somewhat vague proposals for decentralization and administrative reform put forward by Count Berchtold on Aug. 20 prompted the Balkan allies to hasten their preparations. While the slow-moving concert of Europe was discussing alternative proposals for Turkish reform, the Porte suddenly held up Serbian war material at Salonika and began to mass troops round Adrianople. Before any collective step had been taken by the Powers, the situation was gravely compromised by the almost simultaneous mobilization of the Bulgarian, Serbian, Greek

and Turkish armies (Oct. 1). At the last moment the Porte announced its intention to enforce the Vilayet Law of 1880, which had been allowed to remain on paper for a whole generation. But this was very naturally regarded by the Balkan allies merely as a fresh attempt at evasion, and the Powers still further alarmed them by a note which, in its endeavours to soothe Turkish susceptibilities, laid far more stress upon Turkish territorial integrity and sovereign rights than upon the cause of reform. Simultaneously the Powers warned the four Balkan States against warlike action and assured them that even in the event of victory no change in the territorial *status quo* would be tolerated. The further announcement of their intention—after a lapse of 34 years—to enforce the Treaty of Berlin, decided the four allies to precipitate events, and before the impending note could be formally communicated, the King of Montenegro, by an act of undoubted collusion, declared war upon Turkey. On Oct. 13 the other three Balkan Governments presented to the Porte a series of far-reaching demands, culminating in racial autonomy for all the nationalities of the Ottoman Empire, and four days later the Turks, without deigning to answer, declared war on Serbia and Bulgaria. (For the military events, see BALKAN WARS.) All the Great Powers, though for quite divergent reasons, genuinely attempted to prevent war. This is equally true of Russia, who, though privy to most of the designs of the Balkan allies, disapproved because she could not wholly control the time and method of action, and of Austria-Hungary, to whom the existence of an anti-Austrian clause in the treaty had been betrayed, but who already reckoned confidently upon setting the allies at variance before it could come into operation. That the Powers, having failed to prevent war, adopted a passive attitude during its early stages, was due to the almost universal assumption in official circles that the Turks would be victorious, and that the refractory Balkan States would soon be only too glad to accept a settlement dictated from without.

The First Balkan War.—The rapid and overwhelming success of the allies radically transformed the situation. By the end of November Turkish rule in Europe was restricted to the Chatalja lines, the Gallipoli Peninsula, and the three fortresses of Adrianople, Janina (Yannina) and Scutari. The Serbs in particular, after the victories of Kumanovo and Monastir, were in actual occupation of all Macedonia west of the Vardar, and had reached the Adriatic at Durazzo and Medua. They were thus able to go far beyond their obligations under the military convention, by help to the Bulgarians investing Adrianople.

Kumanovo was much more than an ordinary victory. It restored to Serbia that self-confidence which had been so gravely shaken by the rebuffs and scandals of the previous 30 years: and throughout the Yugoslav provinces of Austria-Hungary it was hailed as an atonement for Serbia's downfall on the field of Kosovo, and as a pledge of her new mission as the Southern Slav Piedmont. In Croatia especially, where the Hungarian Government had suspended the constitution and established Cuvaĵ as dictator, there were continual demonstrations in favour of the Balkan allies, even on the part of sections of the population hitherto regarded as Serbophobe. Austria-Hungary at first adopted a waiting attitude, but as the Serbs approached the Adriatic, she suddenly ordered a general mobilization, and suppressed all public expressions of feeling, while the official press of Vienna and Budapest adopted a menacing tone towards Serbia. Great prominence was given to the alleged insults offered to Herr Prochaska, Austro-Hungarian consul at Prizren, and for some days public opinion was allowed to believe that he had been shamefully mutilated by Serbian officers. It only transpired at a much later date that Prochaska, known to be in touch with the open enemies of Serbia in the Sanjak, had been entirely unmolested by the invaders, but that on the other hand he had received definite instructions from Vienna to create an "incident" such as might provide a pretext for action. The Austro-Hungarian chief-of-staff and War Minister, Gens. Conrad and Auffenberg, are known to have favoured a radical solution of the Southern Slav question by

¹ Gešov in his *Memoirs* asserts that King Ferdinand in signing this was decided by his knowledge of the text of a secret Austro-Rumanian military convention, permitting Rumania in the event of war with Russia, to annex not only Bessarabia, but also Silistria, and even ~~Rusuk~~ (Ruschuk), Sumla (Shumla) and Varna.

immediate war with Serbia (*see under AUSTRIAN EMPIRE: Foreign Policy*): and Count Forgač, who as minister in Belgrade, had supervised the anti-Serbian forgeries exposed at the Friedjung trial, was now permanent under-secretary at the Ballplatz and using all his influence with Count Berchtold in favour of war. There is practical certainty, however, that the Archduke Francis Ferdinand on this occasion supported Francis Joseph's aversion to war, and that the decisive factor was Italy's opposition to any "forward" policy from Vienna. As negotiations were already proceeding between Berlin, Vienna and Rome for a fifth renewal of the Triple Alliance (actually signed on Dec. 5 1912 for six years), Italy was able to use as a lever the special Austro-Italian agreement of 1909, by which Austria-Hungary had pledged herself to make no change in the Balkan *status quo*, "without a previous agreement with Italy, based on the principle of compensation." Moreover, Berlin, concerned for the Alliance, insisted strongly in Vienna upon the need for reassuring Rome by a more moderate attitude towards Serbia. The march of events had taken Vienna altogether by surprise, and in complying with its ally's wishes, it was influenced by the altered outlook of the Great Powers. On Oct. 8, in a last effort to avert war, they had warned the Balkan States that no territorial changes would be tolerated. But the success of the campaign and the general relief with which public opinion hailed the downfall of Turkish rule in Europe, soon led to a change in their attitude. On Oct. 30 M. Poincaré proposed a general declaration of *désintéressement* in territorial questions: and though this was rejected by Vienna, its moral effect was only increased when Mr. Asquith spoke in favour of recognizing the accomplished fact and remaking the map of eastern Europe. On Nov. 2 this view was strongly endorsed by M. Sazonov. For the moment all that Count Berchtold could do was to encourage Bulgarian designs on Constantinople and attempt to sow dissensions among the allies. The Turks, seeing themselves isolated in Europe, made overtures of peace as early as the 11th to King Ferdinand, who was not willing to consider them until his troops had been checked before Chatalja. On the 25th, however, negotiations were opened and resulted, not in peace, but in an armistice (Dec. 3) pending a general peace conference in London. When this opened at St. James's Palace on Dec. 16, Serbia was represented by the ex-premier and historian Novaković, the president of the Skupština Nikolić, and the minister in Paris, Vesnić. The wisdom of the allies in excluding Greece from the armistice soon became apparent: for her command of the sea limited the Turks to the Anatolian railway as the sole channel of reinforcement. In London Turkey pursued a policy of dilatory diplomatic intrigue and only receded inch by inch before the very drastic demands of the allies. After a month had been wasted, the Powers, with unexpected unanimity, presented a joint note to the Porte, advising the cession of Adrianople to Bulgaria and hinting at the loss of Constantinople as a possible consequence of renewed hostilities (Jan. 18 1913). Kiamil Pasha laid the proposals of the Powers before a specially convoked council of notables, and was on the point of yielding when the extremists of the Committee of Union and Progress overthrew his Cabinet and murdered the commander-in-chief, Nazim Pasha (Jan. 23). In view of the united front presented by the Powers, there can be little doubt that the new Cabinet would soon have been driven to the necessary concessions. But the Balkan delegates, rightly or wrongly, took the protestations of the Young Turks at their face value, and broke off the negotiations on Jan. 28. The council of ambassadors initiated by Sir Edward Grey continued to sit in London, and devoted especial attention to the Albanian problem and to the friction produced between Albanians and Serbs by the latter's presence on the Adriatic. Since the commandant of Scutari, Hasan Riza, declined to recognize the armistice, hostilities before the town had continued throughout Dec. and Jan., and Serbia sent repeated reinforcements to the aid of the Montenegrins.

Resumed Hostilities.—When war was resumed on Feb. 3 the brunt fell upon Bulgaria, and the Serbs, being complete masters

of Macedonia, were free to contribute 47,000 men and a siege train of 38 guns to the operations against Adrianople, which held out until March 26. The dispute which arose as to whether Shukri Pasha had surrendered to the Bulgarians or to the Serbs, was in itself quite unprofitable, but was a symptom of the friction which was daily increasing between the two allies. Gen. Stepanović, who commanded the Serbian contingent, was allowed to pass through Sofia with his staff, without a single greeting, and on April 16 Bulgaria renewed the armistice with Turkey, without waiting for her allies. The final phase of the war concentrated round Scutari, which Montenegro and Serbia made desperate efforts to reduce. Even the announcement that the council of ambassadors, in fixing the frontiers of the new Albanian State, had definitely included Scutari (while leaving Dibra, Prizren, Peć [Ipek] and Djakovo to the two Serb kingdoms) only served as an incentive to create if possible a *fresh fait accompli*. But Austria-Hungary upheld her veto, and on March 20 addressed a severe note to Montenegro, reproaching her for the murder of a Bosnian Franciscan and other incidents, and at the same time dispatched a strong naval squadron to the southern Adriatic. Her next step was to urge upon the Powers a collective demand for the cessation of hostilities and the withdrawal of the Montenegrin and Serbian forces from the territory assigned to Albania, and to threaten the use of force unless at least the civil population of Scutari were allowed to leave the town (March 23). This demand was supported by Britain, partly in order to avert a conflict, and was conceded: but the close support of Cetinje by Belgrade rendered the danger of Austro-Hungarian intervention increasingly acute. On March 31 the Powers ordered Montenegro to cease hostilities, and on her refusal established a naval blockade of her strip of coast. This seemingly illusory measure at least had the effect of restraining Austria-Hungary, who could not act separately so long as the Powers held together. It was, however, simply defied by King Nicholas, who gained time by consenting to the withdrawal of the Serbian troops and meanwhile closed the frontier and conducted secret negotiations with Essad Pasha, commandant of the town since the assassination of Hasan Riza on March 30. On April 23 Scutari surrendered to the Montenegrins, and the Powers had difficulty in restraining Austria-Hungary from immediate action. What finally decided her appears to have been the knowledge that her seizure of Mount Lovćen (Lovchen), the key to Cetinje, would be followed by Italy's occupation of Valona, with its control of the entrance to the Adriatic.

Amid the countless rival intrigues the Powers presented in public a unanimous front, and on May 14 the Montenegrins found themselves obliged to surrender Scutari to Adml. Burney, as commander of the international fleet. Negotiations could now be resumed in London for a general peace (May 20), and the Powers found it easier to take a strong line. Before the delegates could be brought to business, it was necessary for Sir E. Grey to inform them, with quite undiplomatic bluntness, that unless they were prepared to conclude peace without further delay they had better leave London altogether. By the Treaty of London, which was signed on May 30 1913, and only contained seven brief articles, Turkey ceded to the four allies conjointly the island of Crete and all territory lying to the west of the Enos-Midia line, and all the contracting parties agreed to refer the settlement of Albania and the Aegean Islands to the five European Great Powers, and all financial questions to the International Commission convoked in Paris.

The Dispute between the Allies.—The Balkan allies were now faced by the thorny problem of dividing the spoils. Macedonian autonomy, which the treaty had laid down as the ideal solution, was from the first abandoned by all parties. Their success, as it had far exceeded their expectations, also increased their appetites and encouraged them to extend their claims. Thus while Serbia found herself in effective possession of most of Macedonia, and remembered the imperial traditions of Stephen Dušan, Bulgaria saw the possibility of acquiring Adrianople and Thrace, and not content with the "Big Bulgaria" of the

Treaty of San Stefano, dreamed of "the four seas" (the Adriatic as well as the Black, Aegean and Marmora). The four Governments seemed each bent upon annexing a maximum of territory, and thus too often became the tools of Powers whose ambitious plans of political and military equilibrium they had unconsciously upset. Above all, the long delays in restoring peace stabilized the various regimes of occupation and proved fatal to mutual understanding. Between Bulgaria and Greece there was no territorial bargain, and no obvious means of reaching one, while Serbia as early as Jan. 23 formally raised the question of a revision of the Serbo-Bulgarian treaty. This rested on the argument that Serbia was entitled to compensation for four reasons—(1) that she had furnished her ally with military support far in excess of her bargain, (2) that she had absolved Bulgaria from her military obligations in Macedonia, (3) that she had loyally continued the war three months after her own work was done, and (4) that the acquisition of Adrianople by Bulgaria radically modified the basis upon which the bargain rested. But if Serbia's attitude is to be justified, it must be on the broader ground that events had transformed the situation still further to her disadvantage in another direction. Her two parallel aims in the war had been the political liberation of her kinsmen under Turkish rule, and her own economic emancipation by means of free access to the sea; and from the practical rather than the sentimental standpoint the second was much the more vital. Her whole calculation centred upon securing the Sanjak, Kosovo and a link with Montenegro, and a port in northern Albania (as the best substitute for access through Herzegovina); and when Austria-Hungary imposed her veto upon the latter, the Vardar valley became Serbia's only possible alternative outlet, and this involved her retention of Veles, Prilep, Monastir and Okhrida as well as the "disputed zone." That Vienna deliberately aimed at thus embroiling Serbia and Bulgaria is shown by the fact that during the earlier Albanian negotiations Count Berchtold had offered to Serbia the whole of the Vardar valley with Salonika itself, if she would renounce her Adriatic claims. Bulgaria, on her side, insisted on the literal interpretation of the treaty and showed herself indifferent to Serbia's difficulties on the west.

Meanwhile Russia had made every effort to avert a conflict, Sazonov going so far as to express regret at the Serbo-Greek negotiations (April 17), while warning Bulgaria of possible danger from Rumania, in the event of aggression against Serbia (April 28). On April 30 the Russian ministers in Sofia and Belgrade simultaneously reminded the two allies of their obligation to submit disputes to Russian arbitration. But Sazonov's success in settling a Bulgaro-Rumanian frontier dispute had only served to render Sofia more unyielding, and on May 19 the Bulgarian commander-in-chief wrote to the premier, assuming war with Serbia and Greece to be inevitable, and urging concentration against the former. The pressure very rightly brought to bear by Sir E. Grey upon the peace delegates in favour of the Treaty of London was misinterpreted by the Bulgarians (who alone had any motive for haste) as a guarantee of that Treaty against Turkey, and as dispensing them from the need of guarding their eastern frontier. They were still further encouraged by the openly Serbophobe tone of the official press in Vienna and Budapest: and King Ferdinand had already ordered Gen. Savov to hasten the transference of the army from the Thracian to the Macedonian front, when on May 27 Pašić, under pressure from the Serbian opposition, publicly committed his Government to the demand for treaty revision. This hastened the resignation of the pacific Gešov, behind whose back King Ferdinand was already concerting aggressive action. Before he went, Gešov, under strong Russian pressure, met Pašić at Tsaribrod (June 1) and agreed to Russia's proposal for a meeting of Balkan premiers at St. Petersburg; but a further proposal for the immediate reduction of the allied armies to a third, though accepted by Serbia and Greece, failed owing to the impossible conditions put forward by Gen. Savov. Gešov's successor, Dr. Danev, opposed the meeting of the premiers, contended that Russia had already prejudged the case by even

considering revision, and relied increasingly upon Austria-Hungary. That his confidence was not ungrounded is shown by Count Berchtold's assurance to Rumania in May that the Dual Monarchy was ready to defend Bulgaria "even by force of arms."¹ Serbia and Greece on their part were fully alive to the danger; there had been informal talks between Venizelos and Novaković in London, and between Prince Alexander of Serbia and Prince Nicholas of Greece in January and March at Salonika. After the accession of King Constantine, a less conciliatory mood prevailed in Athens and Belgrade, each of whom in turn made secret overtures to Rumania for a defensive alliance, but without success (April 19, June 8). Their own agreement was hastened by the common danger, and the Serbo-Greek military convention of May 14 was revised on June 1 and supplemented by a definite treaty of alliance for 10 years. While the first of these provided for mutual military support in case of a Bulgarian attack upon either ally, the second extended the *casus foederis* to an attack by a third Power, "in circumstances envisaged by the Treaty of Alliance between Greece and Serbia." Both the wording and the events of the moment make it clear that the intention was to guard against an Austro-Hungarian attack upon Serbia; in 1913 King Constantine took this risk, but in 1915 he was to deny its application.

On June 8 the Russian Government made its supreme effort for peace, by inducing the Tsar to address a personal appeal to the kings of Serbia and Bulgaria, which closed with the warning that "the first to make war would be responsible before the Slav cause." King Peter's courteous though somewhat ambiguous answer was never published; but that of King Ferdinand, which threw the entire blame upon Serbia and argued that the Bulgarian claim had long been admitted by Russia, was a fresh blow to the cause of peace. On June 13 the Powers made a joint *démarche* at Sofia and Belgrade in favour of demobilization, but Bulgaria imposed the impossible condition of a preliminary joint occupation of the disputed territory. Her attitude stiffened still further after the speech of the new Hungarian premier, Count Tisza, who emphasized the right of the Balkan States to settle differences in their own way—even by war—and declared that Austria-Hungary could not allow any other Power to acquire special prerogatives in the peninsula (June 19). As a natural result, Russia's fresh proposals for a conference of Balkan premiers in St. Petersburg, while promptly accepted by Belgrade and Athens, were met by Dr. Danev with a reiterated demand for joint occupation, and a virtual ultimatum giving Russia a week in which to pronounce as arbiter and 48 hours to announce compliance with the request. With Sazonov's sharp reply bidding Bulgaria to expect nothing more from Russia, St. Petersburg's influence over Sofia may be said to have ended. Count Tarnowski, the Austro-Hungarian minister in Sofia, was supreme in the counsels of King Ferdinand during the critical fortnight that followed. The deadlock was complete, when on June 22 the Serbian Cabinet was driven to resign, owing to the resentment of the military party at its alleged moderation. The most it could do was to place itself unreservedly in Russia's hands, and when this was endorsed by the Skupština after a stormy secret session Pašić resumed office (June 26). But Russia was by this time powerless to avert the catastrophe.

The Second Balkan War.—On the night of June 29, without previous declaration of war, the Bulgarian armies made an almost simultaneous attack upon the Serbs and Greeks. Their extended order and lack of proper reserves showed how greatly they had underestimated their enemy, and Gen. Savov is credibly reported to have declared that he could cut through the Serbs like "a knife through rotten cheese." But the Serbian generalissimo, Gen. Putnik, was fully alive to the Bulgarian preparations, and in confidential orders to his commanding officers had warned them that the Bulgars would "use their amicable relations with us" for a surprise attack. In point of fact, on certain sectors those who carried out this "stab in the back" had been dining only a few hours earlier

¹ Prince Filtsenberg to Take Jonescu, who published the facts in *La Roumanie*, Dec. 15 1914.

immediate war with Serbia (*see under AUSTRIAN EMPIRE: Foreign Policy*): and Count Forgač, who as minister in Belgrade, had supervised the anti-Serbian forgeries exposed at the Friedjung trial, was now permanent under-secretary at the Ballplatz and using all his influence with Count Berchtold in favour of war. There is practical certainty, however, that the Archduke Francis Ferdinand on this occasion supported Francis Joseph's aversion to war, and that the decisive factor was Italy's opposition to any "forward" policy from Vienna. As negotiations were already proceeding between Berlin, Vienna and Rome for a fifth renewal of the Triple Alliance (actually signed on Dec. 5 1912 for six years), Italy was able to use as a lever the special Austro-Italian agreement of 1909, by which Austria-Hungary had pledged herself to make no change in the Balkan *status quo*, "without a previous agreement with Italy, based on the principle of compensation." Moreover, Berlin, concerned for the Alliance, insisted strongly in Vienna upon the need for reassuring Rome by a more moderate attitude towards Serbia. The march of events had taken Vienna altogether by surprise, and in complying with its ally's wishes, it was influenced by the altered outlook of the Great Powers. On Oct. 8, in a last effort to avert war, they had warned the Balkan States that no territorial changes would be tolerated. But the success of the campaign and the general relief with which public opinion hailed the downfall of Turkish rule in Europe, soon led to a change in their attitude. On Oct. 30 M. Poincaré proposed a general declaration of *désintéressement* in territorial questions: and though this was rejected by Vienna, its moral effect was only increased when Mr. Asquith spoke in favour of recognizing the accomplished fact and remaking the map of eastern Europe. The Turks, seeing themselves isolated in Europe, made overtures of peace as early as the 11th to King Ferdinand, who was not willing to consider them until his troops had been checked before Chatalja. On the 25th, however, negotiations were opened and resulted, not in peace, but in an armistice (Dec. 3) pending a general peace conference in London. When this opened at St. James's Palace on Dec. 16, Serbia was represented by the ex-premier and historian Novaković, the president of the Skupština Nikolić, and the minister in Paris, Vesnić. The wisdom of the allies in excluding Greece from the armistice soon became apparent: for her command of the sea limited the Turks to the Anatolian railway as the sole channel of reinforcement. In London Turkey pursued a policy of dilatory diplomatic intrigue and only receded inch by inch before the very drastic demands of the allies. After a month had been wasted, the Powers, with unexpected unanimity, presented a joint note to the Porte, advising the cession of Adrianople to Bulgaria and hinting at the loss of Constantinople as a possible consequence of renewed hostilities (Jan. 18 1913). Kiamil Pasha laid the proposals of the Powers before a specially convoked council of notables, and was on the point of yielding when the extremists of the Committee of Union and Progress overthrew his Cabinet and murdered the commander-in-chief, Nazim Pasha (Jan. 23). In view of the united front presented by the Powers, there can be little doubt that the new Cabinet would soon have been driven to the necessary concessions. But the Balkan delegates, rightly or wrongly, took the protestations of the Young Turks at their face value, and broke off the negotiations on Jan. 28. The council of ambassadors initiated by Sir Edward Grey continued to sit in London, and devoted especial attention to the Albanian problem and to the friction produced between Albanians and Serbs by the latter's presence on the Adriatic. Since the commandant of Scutari, Hasan Riza, declined to recognize the armistice, hostilities before the town had continued throughout Dec. and Jan., and Serbia sent repeated reinforcements to the aid of the Montenegrins.

Resumed Hostilities.—When war was resumed on Feb. 3 the brunt fell upon Bulgaria, and the Serbs, being complete masters

of Macedonia, were free to contribute 47,000 men and a siege train of 38 guns to the operations against Adrianople, which held out until March 26. The dispute which arose as to whether Shukri Pasha had surrendered to the Bulgarians or to the Serbs, was in itself quite unprofitable, but was a symptom of the friction which was daily increasing between the two allies. Gen. Stepanović, who commanded the Serbian contingent, was allowed to pass through Sofia with his staff, without a single greeting, and on April 16 Bulgaria renewed the armistice with Turkey, without waiting for her allies. The final phase of the war concentrated round Scutari, which Montenegro and Serbia made desperate efforts to reduce. Even the announcement that the council of ambassadors, in fixing the frontiers of the new Albanian State, had definitely included Scutari (while leaving Dibra, Prizren, Peć [Ipek] and Djakovo to the two Serb kingdoms) only served as an incentive to create if possible a *fresh fait accompli*. But Austria-Hungary upheld her veto, and on March 20 addressed a severe note to Montenegro, reproaching her for the murder of a Bosnian Franciscan and other incidents, and at the same time dispatched a strong naval squadron to the southern Adriatic. Her next step was to urge upon the Powers a collective demand for the cessation of hostilities and the withdrawal of the Montenegrin and Serbian forces from the territory assigned to Albania, and to threaten the use of force unless at least the civil population of Scutari were allowed to leave the town (March 23). This demand was supported by Britain, partly in order to avert a conflict, and was conceded: but the close support of Cetinje by Belgrade rendered the danger of Austro-Hungarian intervention increasingly acute. On March 31 the Powers ordered Montenegro to cease hostilities, and on her refusal established a naval blockade of her strip of coast. This seemingly illusory measure at least had the effect of restraining Austria-Hungary, who could not act separately so long as the Powers held together. It was, however, simply defied by King Nicholas, who gained time by consenting to the withdrawal of the Serbian troops and meanwhile closed the frontier and conducted secret negotiations with Essad Pasha, commandant of the town since the assassination of Hasan Riza on March 30. On April 23 Scutari surrendered to the Montenegrins, and the Powers had difficulty in restraining Austria-Hungary from immediate action. What finally decided her appears to have been the knowledge that her seizure of Mount Lovćen (Lovchen), the key to Cetinje, would be followed by Italy's occupation of Valona, with its control of the entrance to the Adriatic.

Amid the countless rival intrigues the Powers presented in public a unanimous front, and on May 14 the Montenegrins found themselves obliged to surrender Scutari to Adml. Burney, as commander of the international fleet. Negotiations could now be resumed in London for a general peace (May 20), and the Powers found it easier to take a strong line. Before the delegates could be brought to business, it was necessary for Sir E. Grey to inform them, with quite undiplomatic bluntness, that unless they were prepared to conclude peace without further delay they had better leave London altogether. By the Treaty of London, which was signed on May 30 1913, and only contained seven brief articles, Turkey ceded to the four allies conjointly the island of Crete and all territory lying to the west of the Enos-Midia line, and all the contracting parties agreed to refer the settlement of Albania and the Aegean Islands to the five European Great Powers, and all financial questions to the International Commission convoked in Paris.

The Dispute between the Allies.—The Balkan allies were now faced by the thorny problem of dividing the spoils. Macedonian autonomy, which the treaty had laid down as the ideal solution, was from the first abandoned by all parties. Their success, as it had far exceeded their expectations, also increased their appetites and encouraged them to extend their claims. Thus while Serbia found herself in effective possession of most of Macedonia, and remembered the imperial traditions of Stephen Dušan, Bulgaria saw the possibility of acquiring Adrianople and Thrace, and not content with the "Big Bulgaria" of the

drew her troops, but covered her retreat by a note to the Great Powers, begging them to enjoin upon their Albanian protégés a respect for the frontiers created for their benefit (1804). Even after this crisis was over, Count Berchtold made further trouble for Serbia by steadily opposing her Government's very natural desire to take over, so far as Serbian territory was concerned, the shares of the Orient railway hitherto owned by Austrian subjects. Vienna's permanent ill-will was further revealed by attempts to block the conclusion of a concordat between Serbia and the Vatican.¹

By Christmas 1913 the situation in Old Serbia² was rapidly becoming normal, but the administration in the new territory left much to be desired, and the closing of Bulgarian schools, the expulsion of Exarchist clergy and occasional excesses against the Moslem population caused serious unrest and discontent. The Pašić administration became absorbed in defending itself against the increasingly violent onslaughts of the Opposition. In Dec. 1913 and again on June 2 1914 it resigned, but eventually remained in office. On March 4 the Opposition had withdrawn from the Chamber as a protest against alleged unconstitutional action of the Government in budget matters. But though the tension was increased by the activities of a powerful military clique known as "The Black Iland" and by the sudden and arbitrary seizure of its club premises by the masterful Minister of the Interior, Protic, the Government was still in office in the summer. The visit of Crown Prince Alexander and Pašić to St. Petersburg early in February had given rise to rumours of a new Balkan League under Russian auspices; but the advent of Radoslavov to power in Sofia had really made any such plan impracticable, and King Charles of Rumania, though bent upon coöperation with Serbia and receiving the Tsar with special honours at Constanta (Constantza), had no idea of breaking his connexion with the Triple Alliance.

The Assassination of the Archduke.—On June 24 King Peter, incapacitated by ill-health, appointed Prince Alexander as Regent, and simultaneously dissolved Parliament, Pašić having in April pledged himself to the election as for a "Great Skupština" for constitutional changes. Only four days later the assassination of the Archduke Francis Ferdinand and his wife at Sarajevo revived the latent Austro-Serbian conflict in a more acute form than ever. The authors of the crime, Princip and Čabrinović, belonged to a group of Bosnian Serb students, mostly under the age of 20, who gave terrorist expression to the universal discontent aroused by Austro-Hungarian repression throughout her Yugoslav provinces. The victories of Serbia during the Balkan Wars and the openly hostile policy pursued towards her by Vienna and Budapest had assured to her in the eyes of public opinion the position of the Yugoslav Piedmont. Thus no external incentive to the crime was needed: and the young hotheads were further swayed by sentimental considerations. The motive of the Archduke's visit was to conduct manoeuvres which had no meaning save as a rehearsal for a future campaign against Serbia: while the selection of "Vidovdan" (St. Vitus's Day—the anniversary of Kosovo) for his public reception in Sarajevo was regarded as a deliberate challenge to the Serb idea. It was, however, proved that the assassins had been in Belgrade and had been secretly smuggled across the Drina into Bosnia, after receiving hand grenades and revolvers from the Serbian Komitajis Major Tankosić and Ciganović. On these facts the Ballplatz sought to establish the complicity of the Serbian Government, but for this no evidence has ever been produced. Indeed presumption overwhelmingly favours the opposite theory. The country was exhausted by two wars; the Albanian campaign in the previous autumn had shown the reluctance of the peasant soldiers to return to the colours, and it was now the eve of harvest. Military stocks were alarmingly

low, as the next winter was to show. The young Prince had only just assumed the reins of Government; the position of the Cabinet was shaky, and a fierce electoral campaign was opening. The Concordat with the Vatican had only just been signed, and delicate negotiations with Montenegro for a customs and military union and perhaps even a dynastic arrangement, were still pending. Serbia had every conceivable motive for avoiding aggressive action. After the tragedy, it is difficult to see what other course her Government could have pursued; its one omission was to offer a thorough inquiry, without waiting for any suggestion from Vienna. The situation was from the first envenomed by the press of Belgrade, Vienna and Budapest; but it is to be noted that while the former had always had an irresponsible and highly scurrilous section, which the Government was unable to restrain owing to the lack of any proper press or libel laws, the two latter had always been extremely sensitive to the directive of the Ballplatz, and the worst offences were committed by journals with the strongest official ties.

Austria-Hungary and Serbia.—The ominous silence preserved by Austria-Hungary for nearly three weeks after the murder has been very largely explained by the documents published since the war by the Austrian and German republican Governments. From memoranda on Balkan policy prepared for Count Berchtold during May 1914, and re-drafted by him personally both before and after the murder, it is evident that Austria-Hungary was pressing upon Germany the need for clearing up the situation with Rumania, and for attaching Bulgaria to the Triple Alliance, and that Germany wished to use Bucharest as a bridge between Vienna and Belgrade, but dropped this idea after the tragedy. On July 2 Francis Joseph wrote to William II. that the main basis of Austro-Hungarian policy must be the isolation of Serbia, and "her elimination as a political factor in the Balkans," again advocated alliance with Bulgaria and proposed that Rumania should be warned that the friends of Serbia cannot be the friends of Austria-Hungary and Germany.³ On reading the letter the Emperor William said that he must be prepared for European complications and must therefore talk with his Chancellor; but he at once authorized Count Szögyény to inform Francis Joseph that he might reckon upon Germany's full support "even in this case," and he urged that if there was to be an advance into Serbia, it should be at once, especially as Russia was certain to be hostile, though unprepared for war (July 5).⁴ Next day Herr von Bethmann Hollweg instructed the German minister in Sofia to coöperate with his Austro-Hungarian colleague in favour of the Bulgarian alliance, and the German minister in Bucharest to announce Germany's abandonment of all idea of agreement with Serbia. That Germany gave *carte blanche* to Austria-Hungary has been vehemently denied by Bethmann Hollweg in his *Memoirs*, but is admitted in so many words in the preface to the official German White Book,⁵ and is proved by Herr von Tschirschky's assurances to Francis Joseph on July 2, by the instructions which he received from William II. and Bethmann Hollweg, and by William's letter of July 14 to Francis Joseph.⁶ As early as July 8, Tschirschky reported to Berlin Berchtold's intention of drafting an ultimatum in such a form that "its acceptance seems out of the question,"⁷ and not merely is there no trace of Berlin rebuking this tendency, but there are repeated signs of impatience in Berlin at Vienna's delays. Not merely was the full initiative left to Vienna,⁸ but on July 12 there was a joint decision between Vienna and Berlin not to inform Italy of their intentions, but to place her before "an irretrievable situation."⁹ In Vienna the only counsels of moderation came from the Hungarian premier, Count Tisza, who at the Crown

¹ This statesmanlike measure was negotiated by Vesnić, the Serbian minister in Paris, and Gavrilović (afterwards Yugoslav minister in London), aided by Bakutić, a Croat expert in canon law from Sebenico.

² Since 1912 this name was transferred to the original kingdom and the "Old Serbia" of Turkish times became "New Serbia."

Council of July 7 opposed Count Berchtold and declined to admit war to be inevitable. He deprecated a surprise attack, without previous diplomatic action, as likely to place Austria-Hungary in a bad light before Europe and rally the Balkan States against her; he favoured harsh, but not impossible (*unerfüllbar*) demands upon Serbia, and even if their refusal should lead to war, he would not favour Serbia's complete annihilation, partly because Russia would then be forced to intervene, and partly because as Hungarian premier he could not sanction annexations at Serbia's expense. (Here he was following the traditional Hungarian view that the inclusion of further Slavs in the Dual Monarchy was a menace to Magyar supremacy in Hungary.) All the other ministers present—viz. the three joint ministers, Berchtold, Bilinski, and Krobotin, the Austrian premier Count Stürgkh and the chief-of-staff Baron Conrad—were agreed that a mere diplomatic success, even if it led to the public humiliation of Serbia, would be worthless, and that demands must be addressed to her such as would render rejection, and consequent military action, probable. By threatening to resign, Count Tisza carried his point that there should be no mobilization until the ultimatum had been rejected.¹ His attitude is clearly revealed by two memoranda which he addressed to Francis Joseph on July 1 and 8. In the first he condemns Berchtold's idea of using Sarajevo as an excuse for the final reckoning with Serbia as "a fatal blunder," but begs Francis Joseph to make every effort to overcome William's "prejudice in favour of Serbia." From the second it transpires that it was "the satisfactory assurances" of Berlin which had decided all Tisza's colleagues in favour of war with Serbia. He himself dissents, and insists that Serbia must be given a chance of escape, though only through severe diplomatic defeat. This is necessary in order to avoid complications with Italy, to ensure Britain's sympathy and to enable Russia to remain inactive.² On July 14, however, after full discussion with Berchtold, Tisza called upon Tschirschky and announced that "he had abandoned his original doubts and is quite in accord with energetic action,"³ and that "the note will be so drafted that its acceptance may be virtually ruled out."⁴ Berchtold on his side informed Tschirschky that Tisza had not merely come round to his view, but had "in certain points introduced a stiffening." On July 15, in answering an interpellation, Tisza denied that war was inevitable, but significantly added that a State which does not regard war as *ultima ratio* cannot maintain itself as a State. Thus while Tisza must be credited with statesmanship such as was signally lacking in his colleagues, his final decision and his subsequent zeal in the conduct of war make it impossible to claim him or his Government as unwilling actors in the great struggle, just as it is beyond dispute that the Magyar policy towards Croatia and the nationalities was a foremost factor in provoking the Austro-Serbian conflict which actually fired that train.

The Ultimatum to Serbia.—A further proof of Germany's failure to exercise a restraining influence on her ally is afforded by the detailed note presented on July 20 by the Serbian chargé d'affaires in Berlin to Herr von Jagow, expressing the strongest detestation of the murder, the desire for friendly relations with Austria-Hungary and a readiness to meet all such demands as might be compatible with State independence.⁵ Jagow, however, deliberately refrained from taking up the note's concluding appeal for friendly intervention in Vienna, and there is no evidence to show that he even reported to Count Berchtold the Serbian appeal, while on the contrary he ignored King Charles's offer of mediation on July 10. The secret of the ultimatum was jealously guarded, and the long delay, created, as was intended, a false sense of security in some quarters. Its delivery at Belgrade, which took place at 6 p.m. on July 23, was carefully timed for the moment after President Poincaré's departure from St. Petersburg after his State visit, the object

being to eliminate the chances of French mediation. The ultimatum, after reminding the Serbian Government of its formal undertakings of March 31 1909, charged it with "culpable tolerance" of terrorist propaganda directed against Austria-Hungary and blamed Serbian officers and functionaries with planning the Sarajevo murders. It therefore demanded that the "Narodna Odbrana" (League of National Defence) and any similar society guilty of anti-Austrian propaganda should be dissolved, that objectionable passages should be expunged from Serbian educational works, that all officers or officials whom Austria-Hungary might name as guilty of propaganda should be dismissed, and that the Belgrade Government should not merely arrest certain specified persons charged with complicity, but should order the trial of others, allow Austro-Hungarian delegates to take part in the inquiry and accept the collaboration of Austro-Hungarian officials "in the suppression of the subversive movement."

The general impression produced by this document upon European opinion is best summarized in the words of Sir E. Grey, who telegraphed the next day to Sir M. de Bunsen, that he "had never before seen one State address to another independent State a document of so formidable a character." The fifth demand in particular (that of collaboration), he pointed out, "would be hardly consistent with the maintenance of Serbia's independent sovereignty."⁶ None the less, Serbia in her reply actually consented to "such collaboration as agrees with the principle of international law, with criminal procedure and with good neighbourly relations." Only on one point did she reply in the negative; the share of Austro-Hungarian officials in the actual inquiry would, it was argued, be a violation of the constitution and the criminal code, but even this could be met by "communications in concrete cases." On all other points there was unqualified submission, and in certain respects, such as the offer to introduce legislation for fuller control of the press and to stiffen frontier regulations regarding weapons, the answer went much further than had been demanded. As a final proof of sincerity, Serbia offered to submit any outstanding points to the decision of the Hague Tribunal or even to the Great Powers which had imposed upon her the declaration of March 31 1909.⁷ Thus Serbia is found for the third time in six years offering to submit herself to the verdict of the Hague—the two previous occasions being the Bosnian crisis and the Friedjung trial—and each time it is Austria-Hungary who rejects the proposal. Three days later, as a last resort, the Serbian Government informed the Italian Foreign Minister that it was even prepared to swallow the whole note, "if only some explanation were given regarding the mode in which Austrian agents would require to intervene," and went so far as to offer to accept these explanations from a third party, if Austria-Hungary was not disposed to give them to Serbia direct.⁸

Austria-Hungary had demanded an answer to her note by 6 p.m. on July 25, thus leaving a period of 48 hours for either reply or mediation. The official documents published in Berlin and Vienna since the war make it abundantly clear that the Ballplatz deliberately couched the note in such terms as to be unacceptable; but even in 1914 this was obvious from its tenor and from the significant fact that Baron Giesl, who received the Serbian answer from Pašić a quarter of an hour before the expiry of the time limit, instantly handed him a fresh note announcing the rupture of diplomatic relations and the immediate departure of himself and his staff. Moreover the text of the answer was kept secret in Vienna for several days, until a sarcastic commentary could be added; and Belgrade, presumably owing to the confusion which prevailed there, appears to have taken no steps to bring it promptly to the notice of the other Powers.⁹ This is the more regrettable, since even William II. (to judge from his marginal notes on

diplomatic documents, as published since the Revolution) was impressed by the moderation of the Serbs, regarded Vienna's essential wishes as fulfilled and expressed the view that Giesl ought to have remained in Belgrade. His ministers, however, had failed to support Sir E. Grey's proposal for a prolongation of the time limit, and were thus responsible for bringing Russia into action. On July 27 the Tsar replied to a despairing appeal of the Prince Regent for assistance to Serbia, by a telegram strongly urging him to "neglect no step which might lead to a settlement," but conveying the assurance that "Russia will in no case disinterest herself in the fate of Serbia."¹ On July 28 Austria-Hungary formally declared war upon Serbia, and on the same day rejected the Russian proposal for a friendly exchange of views between Vienna and St. Petersburg.²

Henceforward the Austro-Serbian quarrel is merged in the larger diplomatic conflict between Alliance and Entente. Due stress ought, however, to be laid upon one of Sir Edward Grey's many efforts to avert war even at the last moment. On July 29 he received Count Mensdorff's assurance that Austria-Hungary "had no idea of territorial aggrandisement," and when he hinted that there were other means of turning Serbia "into a sort of vassal state," received the rejoinder "that before the Balkan War Serbia had always been regarded as being in the Austrian sphere of influence."³ Undeterred by this ominous attitude, Sir Edward on July 30 put forward the proposal that Austria-Hungary, after occupying Belgrade, should cease her advance and consent to discussions with Russia, who otherwise could not be expected to "suspend military preparations."⁴ In other words, Belgrade would become a kind of pledge in Vienna's hands for the attainment of a satisfactory settlement. The elaborate dispute regarding the Russian and German mobilizations has hitherto obscured the essential fact that on July 31 Francis Joseph definitely, almost petulantly, refused the British proposal as transmitted through Berlin,⁵ thereby rendering the military action of St. Petersburg inevitable.

The Outbreak of War.—When Baron Giesl presented the ultimatum, Pašić had been absent electioneering in the provinces; but he at once returned to Belgrade, and on July 25 mobilization was ordered, and the seat of Government and the archives were hastily transferred to Nish. In view of so grave a crisis elections became impossible, and as parliamentary sanction was more than ever necessary, the Government had no other course than to ignore the fact of dissolution and to call the previous Skupština once more into existence. At its first meeting in Nish on Aug. 1, the entire Opposition endorsed the Government's action, and for the moment party life was in abeyance. Parliament also ratified the Concordat with the Vatican and a law ensuring to Catholicism full freedom of worship in Serbia. There was an unexpected delay in the invasion of Serbia, and it was not till Aug. 12 that the first Austro-Hungarian troops crossed the Drina and the Save. After 12 days of desperate fighting (known as the battle of the Jader) the invaders were thrown back across the frontier, this being the first definite Allied victory. Unduly elated by this success and by the news of Russia's rapid advance in Galicia, the Serbs were now led to underestimate Austria-Hungary's resources, and encouraged by the Allies, passed to the offensive early in September. Their rash invasion of Syrmia—a necessary preliminary to any successful penetration of Bosnia from the east—soon proved beyond their strength and had to be abandoned by Sept. 13; and the joyous welcome everywhere accorded to them by the population merely brought down a cruel vengeance on its head when the Austro-Hungarian army returned. A further mistake was made in attempting to hold the rich but strategically indefensible Mačva (Machva) district, doubtless owing to the horrid excesses committed there by the enemy during their first inroad. None the less the Serbs were able to check a second Austrian advance across

the Drina in mid-September. But on Nov. 6 General Potiorek began a third invasion in great force, and during the next month steadily pressed back the Serbian forces into the heart of their country. The danger was aggravated by shortage of ammunition, and when at last the necessary supplies began to arrive, a large force of Bulgarians armed with machine-guns and acting with the connivance of Sofia, raided the Vardar railway from the Strumnica salient and destroyed an important bridge on the only line by which the new guns could be moved up to the front. The enforced evacuation of Belgrade on Nov. 29 revealed the extremity of the danger, and brought the latent political crisis to a head. On Dec. 5 the purely Radical Cabinet resigned and was succeeded on Dec. 13 by a Coalition Government, in which Pašić remained premier, but the leaders of all parties save the Liberals received portfolios. It was however in this blackest week that the Skupština unanimously endorsed the Government's declaration that its foremost war aim was "the liberation and union of all our Serb, Croat and Slovene brethren not yet set free." This was the first public step of Serbia in favour of Yugoslav unity.

Serbia after the Austrian Rout.—With the arrival of munitions from the West the army's flagging spirits revived, and the brilliant offensive initiated on Dec. 2 by Gen. Mišić and the 1st Army resulted, after a twelve days' battle along the whole front, in the complete rout of Potiorek. By Dec. 14 Serbian soil was for the third time entirely free from invaders, and an enormous booty was captured. But the enemy left deadly infection behind him, and by the early spring of 1915 exhausted Serbia was immobilized by a typhus epidemic which is estimated to have caused about 300,000 deaths among the civil population. A notable part in checking its ravages was played by Lady Paget as head of the Serbian Relief Fund units in Skopje, and by Col. Hunter and a R.A.M.C. detachment, who organized a scheme of disinfection on the whole Serbian railway system. The latter step appears to have been taken in view of the possibility of Allied troops being employed upon the Danube, an idea which receded from the general design, in proportion as the Austro-German recovery in Galicia became more marked. Serbia's negative role during 1915 was due not only to exhaustion but to considerations of high policy. The attitude of Bulgaria was from the first extremely equivocal, and Serbia, had she listened to certain ill-considered pleas for a fresh offensive into Hungary, would have been at any moment liable to an attack from the rear, unless she could rely upon Greece or the Allies to hold Bulgaria in check. Meanwhile the Entente was eagerly working for the intervention of Italy and of Bulgaria, neither of whom could receive adequate satisfaction save at the expense of Serbian aspirations. During the winter pressure was repeatedly brought to bear upon Nish to make territorial concessions to Bulgaria in Macedonia; but the one and only condition upon which Serbia could safely have considered this—namely, that the Allies should guarantee Yugoslav unity in the event of victory—was precluded by their parallel negotiations with Italy, whose official policy it was to prevent, not to further, Yugoslav unity, and to whom by the Treaty of London, concluded on April 26 1915, no less than 700,000 Yugoslavs were assigned. The fact that this treaty's concealment from Serbia was made an absolute condition by Rome, did not tend to diminish the reserve of the Nish Government, who almost immediately learned the essential facts through Mr. Supilo's discoveries in official circles at Petrograd. The Serbs, who were not formally recognized as Allies by the Western Powers, were more conscious than ever of the value to them of the Vardar valley, which would form part of any serious concessions to Bulgaria; and they were from the first sceptical as to the possibility of winning over Bulgaria, whom they believed to be tied to Vienna and Berlin by a secret compact. They were further handicapped by the attitude of Greece, who in the autumn of 1914 exercised her right of veto, under the Serbo-Greek Treaty, upon any cession of territory to Bulgaria and was prepared to demand Monastir as compensation. This attitude could not be ignored at a period when Greece was still ready to intervene on the side

of the Allies, and when even King Constantine had firmly rejected William II.'s suggestion that he should fall upon Serbia and tear up the Treaty of Bucharest. What changed the views of both Athens and Sofia was simply the unfavourable turn in the military fortunes of the Allies. As long as the Bulgarians thought that the Dardanelles would be forced, their help could probably have been secured in return for the promise of Macedonia and the guarantee of an Allied occupation: what was lacking was the corresponding pledge to Serbia. The conclusion of a Bulgarian loan in Berlin in Feb. was the first sign of a change, and after March neutrality was the best that the Allies could hope for from Bulgaria, though she showed great skill in furthering Bulgarian illusions in the West. Thus the concrete proposals addressed to Sofia by the Entente on May 20, over Serbia's head, came two months too late. The Radoslavov Cabinet now played for time, and while asking on June 15 for further details, concluded parallel negotiations with Turkey regarding the Thracian railway. On July 18 the official *Narodni Prava* spoke of the impossibility of Bulgaria keeping out of the war, and public opinion freely discussed the rival alternatives. The final reply of the Entente (Aug. 3) offered Bulgaria the "whole uncontested zone" of the treaty of 1913, with immediate occupation as far as the Vardar; discussion even of Skoplje and of the "contested zone" after peace; Serus at once and Kavalla in the future; and the Enos-Midia line in Thrace. The price was to be war upon Turkey. Greece at once protested, and the Emperor William urged his brother-in-law on no account to cede Kavalla. But the decisive factor was the fall of Warsaw on Aug. 8; not only public opinion, but the general staff now regarded Germany's triumph as inevitable. The Turco-Bulgarian agreement was initiated on the very day after the Allied note, and completed at the end of the month, and on Aug. 20 its negotiator, the Germanophile Žekov, replaced Fičkov as War Minister. Meanwhile the position of the Pašić Cabinet was extremely delicate. It loyally declined to discuss the indirect overtures made to it from Vienna, and stood officially for the programme of unity: but during the summer, yielding to pressure from the reactionaries in Petrograd, it showed a readiness to limit its claims to the territory generally regarded as purely Orthodox—viz. Banat, Syrmia, Bosnia-Herzegovina and South Dalmatia—and to leave the Catholic Croats and Slovenes to their fate. This scheme would have fitted in with Italian designs and with the Treaty of London, which envisaged three separate Slav States, an enlarged Serbia, an enlarged Montenegro and a reduced Croatia. Its weakness lay in the ignorance of its promoters; for even such a division would have left well over a million Catholics in "Orthodox" Serbia. Its failure, however, was above all due to the vigilance of Mr. Supilo and his colleagues of the Yugoslav committee.

The Conquest of Serbia.—In the late summer the Serbian Government was unduly optimistic as to Greek and Rumanian intervention, and its disbelief in a German invasion was encouraged by Allied military opinion. Only three weeks before Mackensen crossed the Danube, Lord Kitchener, in conversation with a Serbian representative, gave his opinion that any action from the north was mere bluff. Hence though the Skupština on Sept. 5 authorized the Government to make territorial concessions, Pašić adopted a waiting attitude. Bulgaria's mobilization, two days after the opening of the Austro-German bombardment along the river front, proved his calculations to have been correct. Yet even at this moment Allied opinion hoped that Bulgaria might enter on the Entente side, and therefore a veto was imposed upon the Serbian general staff's plan for an immediate attack upon Sofia before the Bulgarian army was ready (Sept. 27). Next day Sir Edward Grey in the House of Commons announced that in the event of Bulgaria's aggression "we are prepared to give to our friends in the Balkans all the support in our power, in the manner that would be most welcome to them, in concert with our Allies, without reserve and without qualification." Relying on the fulfilment of this pledge, the Serbs devoted their main effort to checking the Austro-German advance and remained on the defensive towards Bul-

garia. The danger was increased by King Constantine's repudiation of Greece's treaty obligations towards Serbia and the overthrow of Venizelos. That statesman, however, had enquired of the Allies as early as Sept. 23, whether, if Bulgaria declared war on Serbia, and if Greece asked Serbia to supply the 150,000 men stipulated by the Serbo-Greek Treaty for such a contingency, France and Britain would assume Serbia's obligation for her; and an affirmative answer was received within 48 hours. On Oct. 6, the rupture with Bulgaria was complete. The fatal delays in sending the promised troops, coupled with Allied insistence that the Serbs should hold back Mackensen to the last moment, belong to military history; but their results were eminently political. At the critical moment of the Bulgarian menace to the Nish-Salonika railway there were at Salonika not 150,000 Allied troops ready for action, but 35,000 French, and 13,000 British, the latter under strict injunctions from London not to cross the frontier into Serbia.¹ Nish was decorated to welcome Allies who never came. The whole Serbian plan of campaign collapsed, and the armies, losing control of the railway southwards, retired precipitately through the passes leading to the plain of Kosovo. General Sarrail, informed that he must not expect reinforcements, was forced to arrest his belated offensive northwards (Nov. 12) and soon to withdraw to the west of the Vardar. The Serbs were thus cut off from Allied help, lost Skoplje and only just escaped envelopment by the converging Austro-German and Bulgarian armies. The final retreat of the Serbian army and Government took place in the dead of winter across the inhospitable snow mountains of Albania and Montenegro to Scutari, Medua and Durazzo, a smaller section escaping southwards from Prizren and augmenting the Serbian forces south of Monastir. Fortunately, the general exodus of the civilian population was checked before it had gone too far; but the retreat stands out as one of the great tragedies of the war, and the loss of life which it involved must have far exceeded 100,000 and is estimated at twice that number by very sober authorities.² After dreadful sufferings the fugitives were conveyed by Allied transports to Corfu, which for the remainder of the war became the seat of the Serbian Government and a base for the convalescence and reorganization of the army. Notable assistance was rendered by British voluntary units, and some idea of the generous response of the British public to Serbia's need may be gathered from the fact that the Serbian Relief Fund from first to last collected over £1,000,000 in money and material, and employed over 700 workers in Serbia, Albania, Corfu, Salonika, Corsica, Biserta and France, while the Scottish Women's Hospitals under Dr. Elsie Inglis performed notable services for the Serbs both on the Balkan and the Russian fronts. The deaths of Mrs. Deamer, Mrs. Harley (Lord French's sister), Mrs. Haverfield, Dr. Inglis herself and many others set a seal on the new-found friendship of the two nations.

Conquered Serbia was divided for administrative purposes between Austria-Hungary and Bulgaria, the latter holding the Timok, Nish, Skoplje and Macedonia: all that remained to the Serbs was a fragment of territory south of Monastir. Bulgaria now threw off the mask and officially declared the Serbian State to have ceased to exist. It therefore enrolled all men of military age throughout the occupied territory and in Feb. 1917 extended this to include the whole male population. It refused to recognize the Serbian Red Cross and took possession of the Serbian Legation in Sofia. All "ownerless" land was confiscated, all Serbian schools, law courts, and inscriptions were Bulgarianized, libraries and collections were either destroyed or removed to Bulgaria, the Serbian clergy were evicted, and there were wholesale deportations. A formidable rising in the mountains behind Kuršumlje (Kurshumliye) was brutally repressed, with over 2,000 executions (March 1917). The war aims now repeatedly avowed by Sofia were the annexation not only of Macedonia, but of Kosovo and Prizren, and the whole upper Morava and Timok valleys: a common frontier with Hungary: the prevention

¹ See Gen. Sarrail, *Mon commandement en Orient*, p. 27.

² G. Djurić, in *Royal Statistical Journal*, May 1919.

of Yugoslav unity and of Russia's acquisition of Constantinople: and (after Rumania's entry) the retention of the whole Dobruja. Dr. Radoslavov more than once proclaimed Bulgaria's resolve to keep all her conquests,¹ and his official organs declared that Serbia's reconstitution, "no matter under what form, would be a perpetual menace to Balkan peace" and will never be permitted.² Austria-Hungary showed much greater reserve, airing from time to time various alternative schemes for a vassal Southern Slav State under the Habsburgs, keeping Prince Mirko of Montenegro as a possible candidate for its throne and employing agents in Switzerland to sow dissension among the exiles.

The Serbs in Exile.—Soon after the establishment of the Serbian Government at Corfu party rivalries began to revive. The deputies were scattered, living mostly on the Riviera, an independent press was impossible, and regular Allied subsidies made the Government virtually immune from serious democratic control. The supersession of the Voivode Putnik and almost all his staff caused great indignation, and though the whole Serbian Coalition must bear the responsibility, it was known to be the work of Pašić, and his masterful colleague in the Radical party, Protić, then still out of office. In Aug. 1916 an attempt is alleged to have been made upon the life of the Prince Regent at the front, and the Government, after vainly urging the Skupština to institute a new form of courts-martial, proceeded in the winter—while the joint advance under Sarraill was crowned by the capture of Monastir from the Bulgarians—to order numerous arrests on a charge of conspiracy and murder. Among those implicated were the late governor of Macedonia, Gen. Popović, the ex-War Minister Gen. Bojanović, and several distinguished staff officers: many line officers known for their gallantry were placed on the retired list or confined to the island at Corfu.

The Conspiracy Trial which opened in Salonika in Jan. 1917 and was conducted behind the shelter of a strict military censorship, resulted in a death sentence upon nine Serbian officers, and notably of Col. Dimitrijević, the head of a secret society known as "Union or Death," or more colloquially the Black Hand, whose chief aim had been to fan nationalist sentiments in the army. There is no doubt that "Apis," as Dimitrijević was called throughout the Slavonic South, interfered unwarrantably in politics, and it is probable that he had his hand in the Sarajevo murder; but the lack of convincing evidence for the alleged conspiracy makes it probable that he was the victim of rival military and political cliques. Strong pressure of the Old Radical leaders forced the Prince Regent to sign three death warrants and to disregard appeals for mercy from the Western capitals. This trial revived all the old party dissensions: the reactionaries had triumphed on the very eve of the collapse of their chief support, the Tsarist Government. Pašić found himself between two fires—the need for a more democratic restatement of foreign policy, and the demand of the young Radical and Progressive parties for a revision of the Salonika trial. Refusal led to their withdrawal from the Cabinet, and its reconstruction on a purely Old Radical basis under Pašić and Protić. The last occasion when all parties co-operated was on July 20 1917, when the Declaration of Corfu, drawn up between Dr. Trumbić for the Yugoslav committee and Pašić for the Serbian Government, met with unanimous approval. Pašić, having strengthened his position abroad by a visit to Paris and London, declined to convoke Parliament for four months after the legal period had expired. At last, as the result of a direct appeal of its President to the Crown, it met in Corfu on Feb. 12 1918; and the Government resigned, but after weeks of fruitless negotiation for a coalition ministry, was allowed to resume office. The Opposition, which numbered 60 as against 64 Old Radicals, still insisted on the revision of the trial and the transference of foreign affairs from Pašić to their own candidate Drašković; and in April, when the budget was introduced, they withdrew in a body from the Chamber, thus leaving the Government without the quorum of 84 required by the

Serbian Constitution. Serbian public opinion was too scattered and disorganized to be effective, and the Corfu Government tried to discredit its opponents' action before the uninformed West, as defeatist or even Austrophil. Thus throughout the spring and summer of 1918 there was acute and growing tension among the rival Serbian groups, and the real initiative in the Yugoslav question and in the political campaign against Austria-Hungary, had passed to Trumbić, Beneš, Lansing and the Allies and to the leaders of the movement inside the Dual Monarchy. Pašić had reverted to his Pan-Serb attitude, opposed inclusion of Dr. Trumbić in a Yugoslav and no longer purely Serb Cabinet, and steadily obstructed the Yugoslav committee's work. There was, moreover, a certain section in the army which aimed at Serbia's military occupation and annexation of Habsburg territory, rather than a free union on equal terms. Fortunately all such ideas were absent from the mind of Voivode Mišić, whose comprehension of the issues at stake was illustrated by his special encouragement of the Yugoslav volunteers and by his signal tact in dealing with the newly constituted Government in Zagreb. Events, moreover, favoured union on terms of full equality; for Austria-Hungary had ceased to exist and her authority had been shaken off by all her Yugoslav subjects long before the Serbian army in its northward advance had even reached Belgrade. Any slight possibilities of initial friction were averted by Italy's action in advancing beyond the Armistice line; the whole Croat and Slovene population thus clamoured for the arrival of the Serbian army and received it everywhere as their liberator from Habsburg rule and their champion in the complications which then seemed imminent. (For the completion of national unity, see YUGOSLAVIA.)

SERBIAN CAMPAIGNS.—Although the Balkan area developed into one of the side-shows of the World War, it was there that it started in 1914 with the ultimatum of Austria-Hungary to Serbia. The 1914 operations and the conquest of Serbia in 1915 are narrated in separate sections below. Under SALONIKA CAMPAIGNS an account is given separately of the Allied operations on the southern Serbian front, 1915-8.

I. OPERATIONS IN 1914

The Austro-Hungarian military problem in starting a campaign against Serbia was complicated by the prospect of a Russian intervention in Galicia. The alternatives were: to defeat Serbia completely before the Russian threat became deadly, or to stand on the defensive against Serbia till after a great battle had decided the issue in Galicia.

The strategic geography of Serbia was, in its broad lines, simple. On the N. side there is the formidable obstacle of the

¹ e.g. in *Vossische Zeitung*, Oct. 10 1916.

² e.g. *Narodni Pravi*, May 19, *Kambana*, Oct. 9 1916.

Danube and Sava, on the W. the line of the Drina, a river not very broad, but rapid and difficult to bridge, these rivers forming the actual frontier.¹ Initially then the assailant must begin by forcing a river barrier, whatever the direction of his advance, and his power to do so depended: (a) on the communications on his own side of the river, which would enable him to collect the troops and material for forcing the passage; (b) on the barrier itself; and (c) on the defensive positions available for the Serbs inside the barrier. Taking all these factors together, an attack on the northern barrier offered the best chances of success. It was the course chosen by Prince Eugene in 1717 and by Mackensen in 1916, and it was that which the Serbs themselves regarded as most likely to be taken in August 1914. The reasons which led the Austrian commander to choose differently will be considered presently. More important than the choice of a point at which the barriers could most easily be forced was the choice of a direction for the subsequent advance. The objectives were plain enough, the defeat of the Serbian field army and the occupation of the most important part of the country. Without the attainment of these objectives, Austria could not pretend to have conquered, or even to have defeated, Serbia. Both, however, were attainable by an invasion of the Belgrade-Pozharevats-Kraguevats-Krushevats region, conventionally called the Morava valley. This was the richest part of the country, and the centre of all its communications. Here and here only could the Serbian army be definitely brought to action under conditions in which the Austrian superiority of numbers would be effective.

This region could be approached from the N. (Belgrade or Danube-Pozharevats front), from the N.W. (Sava and Lower Drina front), from the W. (Middle Drina front) or from the S.W. (Upper Drina front).² The first named was the most direct route. For the forcing of the Danube³ five railheads on the Hungarian side were available, for the prosecution of the advance the Orient railway (Belgrade-Constantinople) and various branches of it. The country was rich in local supplies, populous, and relatively well provided with roads, and the general trend of the natural features, governing that of the lines of communication, was from N. to S. On the other hand, the defender would of course be best prepared for attack on this front, and the Danube obstacle was here most difficult to overcome, in spite of the command of the water ensured by the Austrian monitors.⁴ Next in importance were the lines of advance from the Sava and Lower Drina, and especially those from the Sava, since the Drina valley was totally destitute of railway approaches on the Hungarian side. In the angle of the Sava and Drina lies the fertile plain of the Machva; many favourable points exist on the Sava for the forcing of a crossing, and the town of Shabats in particular offers a choice of tolerable roads leading S. to the slopes of the Tser (Cer) range S.W. to Valyevo, and W. to Arangyelovats, the last-named route conducting an invader to either Palanka or Kraguevats in the Morava region. In conjunction with such an advance, an operation on the left, over the Lower Kolubara, supplied from the Sava, would lead to the rear of Belgrade, while on the other flank a successful operation by troops organized for mountain warfare by Valyevo over the Kolubara and Rudnik ranges to Gorni Milanovats and Chachak would threaten the rear of the whole Morava region. As a way of turning the great obstacle of the Danube front, the lines of advance grouped on the axis Shabats-Arangyelovats possessed tempting advantages. But, considered from the point of view of supply, the disadvantages were very serious. Not only was this the longest route

between the railheads of deployment and the final objective, but it was destitute of railways⁵ E. of the Kolubara. West of that river, indeed, the line Valyevo-Arangyelovats-Palanka lay in the very axis of the march, and a branch-line connected this with Obrenovats on the Sava, where water-borne supplies could be unloaded. But the barrier of the Kolubara and the ridge behind it had to be mastered before this branch could be used, and it was certain that the Serbs could assemble in time to fight on the Kolubara line if not W. of it. That is, from deployment to the first great battle the campaign would have to be carried out with road transport, and in the case of the rightmost routes (axis Valyevo-Chachak) pack transport only.

From the Middle Drina (Lyeshnitsa-Lyuboviya front) all routes converge on Valyevo, at the head of the Kolubara. Thence operations towards Arangyelovats, Gorni Milanovats and Chachak would take the course already discussed. But up to Valyevo operations would lie wholly in mountainous country⁶ and would depend for supply almost entirely on pack transport from distant railheads—for in Bosnia the railways come to an end 25-27 m. W. of the Drina, and from that river to Valyevo is a further 32 miles. All arguments against the choice of the Shabats route therefore applied with far greater force to the Valyevo route. Farther S., in the region of Vishegrad, operations into Old Serbia by way of Uzhitse might gain a footing, or help a Valyevo force to gain a footing, at Chachak. But such operations would be mountain warfare pure and simple. Although in this part the railway runs right up to the frontier, no body of troops large enough to deal with the Serbian army could be collected and fed in the upper valley of the western Morava, either by way of Uzhitse or by way of Valyevo. As a threat to the flank and rear of a beaten Serbian army retreating up the Morava valley, such manoeuvres might be effective; but to the beating of that army they could contribute practically nothing. Operations from Vishegrad into New Serbia would be too eccentric to have the slightest influence upon the conflict of armies in the Morava valley, and the same would apply to operations from Focha or from the Herzegovina against Montenegro, supposing that state to join Serbia in resisting the Austrian advance. Operations in this quarter would be scarcely more than guerrilla.

On a review of the conditions, then, the most logical plan of campaign from the Austrian point of view would be a frontal operation S. from the Danube front, coupled with an enveloping movement from the Sava (or Sava-Lower Drina) front directed on Arangyelovats, the latter either preceding the other by some days and seeking to surprise possession of the Kolubara ridge, or following it and directed to the flank and rear of an ascertained position of the enemy. Loosely connected with these main operations an advance from the Middle Drina or Vishegrad or both on Chachak and the western Morava had advantages for the exploitation of victory, but not for the winning of it. Such a plan was proposed before the war in the Austrian staff, and practically the same plan was assumed by the Serbians as the basis of their defensive deployment. Whether any or all of these operations could be carried through before the Russians intervened, or before their intervention became dangerous, would depend on available time. If no time at all were available, a pure defensive was the only course. If time for a thorough conquest, all the operations above mentioned with proper proportioning of strength would contribute something to a decisive success. In any intermediate conditions, one or more of the subsidiary operations would be omitted from the plan, and, especially, if a minimum time were available only the direct S. attack from the Danube front would be admissible, with or without a collateral attempt by light forces from Shabats or Obrenovats to seize the Kolubara ridge.

The calculation of this available time depended principally upon the arrangements made between the Austrian and the German staffs for initial operations in Poland, Galicia and E. Prussia. For this a plan had been drawn up by Conrad von Hütten-dorf and Moltke in consultation; and, on the basis of this plan,

⁵ Even the Yadar valley road was in many places unsuitable for wheeled transport.

¹In its upper course the Drina passes inside the Austrian frontier, and direct advance into Serbia is therefore possible from the region of Vishegrad. But this roadless, mountainous region is quite unfitted for the movements of large forces.

²Attack from the stretch of the Danube front lying in the mountains between Weisskirchen and the Iron Gates was regarded by both sides as outside the limits of probability.

³The lowest reaches of the Sava are usually considered as belonging to this front.

⁴Six in number, armed with 4.7-in. guns, and armoured.

⁵The small line connecting Shabats with Loznitsa was of no importance except in the case of stabilized trench warfare in the Machva.

the scheme of operations adopted against Serbia was apparently the full scheme outlined above; concentric advance from all the fronts in varying strengths and at various dates. Nearly half the army was placed in position for this advance, and the Austrian supreme headquarters intended to conduct the campaign itself. But at the last moment, it is asserted, the Germans, rightly or wrongly, changed their minds, the allies' scheme for Poland and Galicia fell to pieces, and, in trying to adapt their plans to the new conditions, the Austrians threw their S.E. forces into confusion before they had even deployed. The responsibility for a grave initial blunder, then, lies ultimately with Moltke, if he failed to keep his promise, or with Conrad, if he interpreted a mere interchange of views as a binding engagement. In any case the effect was to withdraw the forces on the San-Danube front to another theatre amid the battle for the river crossings.

The Yadar Campaign.—The deployment, carried out according to the original scheme,¹ in spite of the fact that, at some date not yet known, it had been decided to make a radical alteration, was as follows:—

II. Army.—General of Cavalry Böhm-Ermolli on the Danube-Sava front from Weisskirchen to Mitrowitz (Mitrovicza). Left to right—VII. Corps (34th and 17th Divs.); 7th Div.; IV. Corps (32nd and 31st Divs.); IX. Corps (29th Div. only); 10th Cavalry Division. In reserve 23rd Honved Division. Total: 131 battalions, 42 squadrons, 56 batteries.

V. Army.—General of Infantry Liborius von Frank. On the Lower Drina from mouth to Lyuboviya, and left to right—VIII. Corps (9th Div., 21st Landwehr Div. and combined brigade); XIII. Corps (36th Div., 42nd Honved Div., one brigade, one mountain brigade). Total: 79 battalions, 15 squadrons, 39 batteries.

VI. Army.—Feldzeugmeister Potiorek. Vishegrad-Focha region, left to right—XV. Corps (1st and 48th Div. staffs with 4 mountain brigades); XIV. Corps (18th Div. staff and 6 mountain brigades); in reserve 40th Honved Division. Detached, facing Montenegro, 47th Div. and 3rd Mountain Brigade. Total: 74 battalions, 5 squadrons, 40 batteries.

Each army had in addition one Landsturm brigade and the V. and II. one to three "march" (i.e., reinforcement) brigades.

Of these forces the II. Army was withdrawn on Aug. 14,² leaving the others in full battle on the Drina. That this battle was in being, however, was due not to Conrad, who—naturally, under the changed conditions—ordered the "Balkan Forces" to stand on the defensive, but to "Feldzeugmeister" Potiorek, commander-in-chief as well as commander of the VI. Army. This officer, high in favour at Court, had been for some years viceroy in Bosnia-Herzegovina, and regarded the problem from the standpoint of the Sarajevo residency rather than from that of a military headquarters faced with a military problem. He saw above everything else the possibility of the Serbians advancing over the Drina to excite insurrection among their brothers and cousins, although there was nothing in the layout of the Serbian deployment to suggest this, and he not only kept the centre of gravity of the forces on the Drina, but, on his own responsibility, launched a "preventive" offensive on this unfavourable front.

On the Serbian side, general mobilization had been ordered on July 25, months since the demobilization that marked the end of the Balkan Wars. Of a population of about 3,100,000 in Old Serbia and about 1,800,000 in New Serbia (where there had been no time to set up the administrative machinery of conscription), 489,500 men were mobilized at the outset and some 43,000 more between August and September.

On Aug. 5 1914 Montenegro declared war on Austria-Hungary. Her forces amounted to about 50,000 militia with very little artillery, and were of no direct assistance to Serbia. But they occupied the attention of three mountain brigades of the enemy's army and, what was perhaps more important, they added considerably to Potiorek's politico-military anxieties.

Strategically, there were three possible courses open to the Serbs: the defensive in their own country, the offensive W. into Bosnia, Herzegovina and Croatia, and the offensive N. into Hungary; but the first course was the only one practicable. An offen-

sive into Bosnia, even with Montenegrin aid, could only have succeeded if the populations there had been ready to rise at the first signal, which they were not. Politically, it would have played into the hands of the enemy by showing the world that Austria's fear of Serbian ambitions had been justifiable. Militarily, an offensive over the Drina presented the same supply difficulties in either direction. An offensive into Hungary, whether to the right or left of the Danube, must begin with the forcing of the Danube or the Sava, and in view of the disproportion between the opposed forces had no chance of success unless the bulk of the Austro-Hungarian army were at the same time closely engaged in Galicia and Poland. In the initial stages of the operations at any rate, therefore, such a movement was out of the question.

The strategy adopted was, therefore, purely defensive, in spite of the offensive victories of 1912-3 and the mania for the offensive at all costs and in all conditions which then pervaded almost every army in Europe.

The order of battle was as follows, the Crown Prince Alexander being commander-in-chief, and Voivode R. Putnik chief-of-staff, with headquarters at Kraguyevats:—

I. Army.—General Boyovich. Divisions Timok I., Timok II., Morava II., Danube II., 52 battalions, 7 squadrons, 26 batteries: approximate strength 55,000, grouped about Palanka and Racha and Topola.

II. Army.—General Stepanovich. Divisions Shumaja I., Morava I., Danube I., and "Combined Division." 64 battalions, 10 squadrons, 33 batteries, about 71,000 men. Grouped about Arangyelovats, Lazarevats, Belgrade.

III. Army.—General Yurichich-Stürm. Divisions Drina I., Drina II., 28 battalions, 5 squadrons, 16 batteries, about 32,000. Grouped around Valjevo.

Uzhitse Army.—General Boyanovich. Division Shumaja II., Uzhitse Brigade, 24 battalions, 2 squadrons, 11 batteries, about 26,000. Grouped at Uzhitse and Bainabashita.

Independent Cavalry Division.—Sixteen squadrons, one battery, about 3,000 concentrated at Ub.

Belgrade Group.—About 9 battalions, 2 squadrons, 10 batteries.

Obrenovats Group.—About 11 battalions, 5 batteries.

Other frontier troops, in all about 25 battalions, 13 batteries.

In infantry, therefore, the Serbians had about 213 battalions to pit against the 272 of the enemy's II., V. and VI. Armies. On the other hand, nine out of ten of the men in these 213 battalions had fought in the wars of 1912-3. In artillery the opposed forces were nearly equal, about 110 Serbian to about 130 Austro-Hungarian; three-quarters of the Serbian guns were of a better model than the Austrian, and some heavy artillery was available. On the other hand, the equipment of the Austrians and their resources in ammunition and stores were much superior, for Serbia was nearly isolated, the one available arsenal was small, and stocks depleted in the Balkan Wars had not been made good.

In sum, then, it would appear that the Austrian expeditionary force—even counting the II. Army which appeared only to be withdrawn, and the III. Corps which did not appear at all—was none too strong for the defeat of the Serbian field army, let alone its destruction. And as soon as it had been decided to withdraw the II. Army, replacing it by a mere screen along the Danube, it was or should have been obvious that the 141 battalions, 17 squadrons and 70 batteries of the V. and VI. Armies were far too weak a force to attempt an offensive into difficult country held by superior numbers of well-trained and war-experienced troops. Potiorek, however, decided otherwise.

From July 26 to August 11 only minor incidents took place—bombardments of Belgrade and other places by the monitors, raids over the river for reconnaissance purposes. Then, on the night of August 11-12, the Austrian main bodies began to cross on a wide front at Drenovats (near Shabats) on the Sava, several points between Lyeshnitsa and Loznitsa on the Lower Drina, and Zvornik and Lyuboviya on the Middle Drina. On the 12th the frontier troops of the Drina defence were pushed back concentrically in the general direction of Valjevo, those of the Sava defence driven out of Shabats. E. of that point the II. Army, under orders for Galicia, remained inactive except for the seizure of Gipsy Island (Ostrovo Tsiganlyia) close above Belgrade, while in and S. of the Vishegrad region the XV. and XVI. Austrian

¹ The III. Corps (6th and 28th Divs., 22nd Landwehr Div.), however, which mobilized with the other seven corps, did not proceed to the Serbian front, but was dispatched to the Dniester at once.

² It arrived in Galicia too late for the crisis there.

corps were preoccupied by the activity of the Uzhitse army,¹ and the Montenegrins.²

During the 12th and following days the Serbian headquarters became convinced that nothing was likely to come from the Danube front, and shifted the centre of gravity of their forces towards the Upper Kolubara. The cavalry division at Ub was ordered to reconnoitre towards Shabats and to separate the Shabats column of the enemy from the Drina columns. The II. Army was to push the right wing (Shumaja I.) against Shabats, and its centre and left along the Tser and Iverak ridges and the Yadar valley in conjunction with the III. Army, which concentrated forward from Valyevo to Zavlaka and Krupany to support its retiring outposts. The I. Army was to take over the whole northern front as far as Obrenovats. The Danube 1st Div. was transferred to it, the II. Army receiving Timok I. in exchange.³ These movements, in spite of forced marching, took time, and but for the difficulties which at once arose in the Austrian army—the V. Army had only wheeled transport—so forward a concentration would have been impossible. As it was, the dispositions were practically realized by the night of Aug. 15–16, when the battle proper opened with the Austrians on the front Shabats–Slepcevisch (elements of IV. Corps, and 20th Div., X. Corps, both of II. Army); Bela Reka–Tser plateau and Lyeshnitsa valley (VIII. Corps); Iverak ridge and Yadar valley W. of Yarebitse (36th Div., XIII. Corps); W. of Krupany and N.E. of Lyuboviya (remainder of XIII. Corps).

During the night and the day following there was heavy fighting on this line. The Serbian cavalry division, supported by Shumaja I. of the II. Army, pushed up to and towards the left of the positions of the Austrians about Shabats. The II. Army arrived in sufficient strength to hold a line on Tser, in the Lyeshnitsa valley, and on Iverak, in touch with the right of the III. Army W. of Yarebitse. But the centre and especially the left of that army retired under severe pressure from the Austrians (right of XIII. Corps) who, in this case equipped for mountain warfare, were able to capture Krupany and enforce the swinging-back of the whole Serbian left wing. Yarebitse was given up and, pivoting on the right of the II. Army, the remainder of that army and the III. took up new positions in an arc about Zavlaka (night of 16–17th).

On the 17th the Serbian cavalry spread over the Machva, intercepting communications between the Austrian Shabats force and the columns working along Tser plateau.⁴ But Shu-

¹ On Aug. 2–4, Serbian forces captured Uvats, Rudo and Uti-var, and raided the Drina immediately below Vishegrad. Other raids were pushed, with Montenegrin co-operation, over the Metalka Saddle on Chaynichia (Cajniče), and towards Focha. On the 7th an Austrian advance from Vishegrad on Gradište was checked by the Serbians. On the 16th a Serbian attempt to capture Vishegrad by forces from Uvats, Gradište and the hills to the N.E. was repulsed. The Austrian XV. and XVI. Corps at the same time took the offensive on the front Vishegrad–Chaynichia. While the left flank was being cleared by sharp mountain fighting (19th) about Chelebiash (S.E. of Focha), the Chaynichia force crossed the Metalka Saddle and moved on Plevlje, Priepolye, while the Rudo troops on the left forced the Serbian positions on the Lim at Uvats and Priboy (20th–22nd) and the Vishegrad troops repulsed a second attack on their stronghold (20th–21st). But at this moment the collapse of the main offensive on the Drina compelled the Austrians to retreat to Vishegrad and Focha, whither they were followed by the Uzhitse army and the Montenegrin Plevlje group.

² On Aug. 7–11 Montenegrin forces raided Artovatz on the Gatsko road and Klobuchi on the Trbinye road. Cattaro was intermittently bombarded, and Budua raided, from Mount Lovchen. These raids were repelled by the Austrian 3rd Mountain Brigade and 47th Division. But on Aug. 15 the main body of the Montenegrins appeared before Bilek (Bileva) which they blockaded for some time. On the 25th–26th, however, a northward sortie of the garrison, coupled with a southward advance of the 3rd Mountain Brigade from Gatsko, caused the Montenegrins to give up the blockade, and on Aug. 30–Sept. 2, forces from Trbinye co-operating, the 3rd Mountain Brigade and the Bilek force drove back the invaders into their own territory. A threat to the Montenegrin rear by part of the 3rd Mountain Brigade which advanced from Gatsko S.E. to Visznitsa Do largely contributed to the result.

³ This distant division seems to have reached the front on the 18th.

⁴ The Austro-Hungarian force at Shabats was limited to pure self-defence by orders of the army command which was preparing

maja I., advancing from the S. on Shabats, was arrested by entrenched infantry some 3 m. short of its objective. The II. Army on Tser and Iverak and the right of the III. Army in the Yadar valley maintained an unbroken front, and on Tser in particular carried out counter-attacks, but the continued pressure from the S.W. on the centre and left of the III. Army compelled a further retreat. Here the situation was becoming critical, the Austrian 42nd Div. threatening to seize the Valyevo road to Oschchina behind the Serbian positions, while farther to the S.E. only third-ban troops stood between the Austrian mountain brigades and the Petska–Valyevo road.⁵

On the 18th the fighting continued in front of Shabats, and Shumaja I. drew back to Slatina, while the cavalry division, meeting the Austrian 21st Landwehr Div. about Lipolist, fell back to concentrate in line between Shumaja I. and the Tser ridge. On Tser and Iverak the day was a repetition of the 17th, with more pronounced counter-attacks on the front of the defence. On the right of the II. Army the strong position of Kozaninograd on Tser was stormed and held, in spite of the fact that reserves had been given up to strengthen the III. Army. On the critical wing of that army also the day was rather more favourable,—thanks to the arrival of the II. Army reserves alluded to above, which by counter-attacks prevented an imminent breach in the centre of the III. Army, now E. of Zavlaka, in the Yadar valley. Farther to the S.W., little ground was gained by the Austrian mountain troops, the Serbians still holding Rozan and Proslop at night.

The 19th was destined to be the critical day. On the Serbian right, the Austrian Shabats force, now superior in numbers to Shumaja I., took the offensive and drove back the Serbs to the river Dobrava, while the 21st Landwehr Div. from Lipolist pressed back the cavalry division a short distance. On the left of the general front, the III. Army and the left of the II. lost ground, both in the Yadar valley and on the extreme left where Rozan and Proslop and even Petska fell into the enemy's hands.

But in the centre, on Tser and Iverak, a definite change in the situation set in. Freed by the capture of Kozaninograd on the previous day, the Serbian "Combined" division on Tser pushed ahead rapidly along the ridge, although with every advance it was more and more ahead of the troops on either flank. This success not only imposed caution on the assailants of the cavalry division on the Machva plain, but, what was of decisive importance, brought them into positions overlooking the Lyeshnitsa valley. Threatened in rear, and with their wheeled transport exposed to capture, the Austrians began to fall back not only in that valley but also on Iverak before Morava I., and General Stepanovich decided to ignore the grave position of affairs on his left and force victory in the Yadar valley. The "Combined" division and Morava I., therefore, always echeloned from right to left, drove along Tser and Iverak, Timok I. in the Yadar valley conforming. The battle of the Yadar was decided.

On the 20th the drive along the ridges was accentuated more and more, and the Austrians fought no longer for victory, but for escape. So vigorous was the pursuit on Tser that a part of the "Combined" division outran all support and barely escaped destruction in the rear of the enemy's lines. Both along Tser and along Iverak, artillery was, with great efforts, pushed up behind the advancing infantry to shell the valleys below. In the Yadar valley Yarebitse was captured by 10 A.M. and the general pursuit ended near the Drina the same evening. The right wing of the Austrians, less hard pressed and better organized for movement in rough country, retired in good order. Morava II., from Valyevo, only reached Krupany on the 21st. No attempt was made, however, by the Austrians either on the Lower or the

for the move to Galicia. After crossing on the 12th, it was actually withdrawn again on the 14th, leaving only outposts on the hostile bank. At Potiorek's request, however, the 29th Div. was again sent over the river on or about the 17th.

⁵ So serious was the situation that already on the 16th G.H.Q. had ordered Morava II. of the I. Army, hitherto posted about Lazarevats to meet a possible attack by Obrenovats, to move by forced marches to a position astride the Petska–Valyevo road. The division reached this position on the 18th.

Middle Drina to keep a foothold on the right hand, and on the 22nd the whole river front was again occupied by the Serbians.

Meanwhile the troops of the Austrian II. Army had ceased to press Shumaja I. on the line of the Dobrava, and begun to fall back on Shabats, and the 21st Landwehr Div. in the plain likewise retreated on the Drina, followed by the Serbian cavalry division which gleaned prisoners, guns and vehicles. On Aug. 21-22, Shumaja I., reinforced by troops from Tser on its left, and also by Timok II. from the I. Army, advanced from the S.E., S., and S.W. on Shabats, held by elements of the IV. Corps and by the 29th Div., under the command of General Tersztyanski. On the 23rd sharp counter-strokes were made by the Austrians to hold off pressure on their river flank. Only rear-guards remained in Shabats when the Serbs attacked on the 24th.

So ended the first invasion of Serbia. The principal reason for its failure was the Austrian commander-in-chief's undervaluation of the military, and overvaluation of the political, factors with which he had to deal. Neither on the part of the Higher Command nor on the part of the Court was pressure brought to bear on him. Nor, after the event, did he attempt to find scapegoats among his subordinates. What he did, he did in the exercise of unfettered judgment. But history will not regard this judgment as of a high order. To hurry¹ on an offensive in mountainous country, from a starting-point at a maximum distance from the strategically decisive point, with three armies equipped in the main for warfare in the plains, of which one was under orders for another theatre, is so astonishing a proceeding that it can only be assumed that the campaign was never intended to be more than a demonstration of activity, analogous to a punitive march up some valley of the Indian frontier region. And indeed, Potiorek's position as civil and military commander of a rough frontier region has been very aptly compared to that of an Indian viceroy. Regarded from this standpoint, the advance over the Drina is an operation differing in degree only from the advance of the XV. and XVI. Corps on the Lim or that of the 3rd Mountain Brigade into the fastnesses S.E. of Gatsko. And in such an operation the assistance of the II. Army might no doubt be dispensed with. But if the ground of justification be thus shifted, the basis of criticism is shifted also, and in that case what is to be said of a modern European commander-in-chief who thought that an organized army of 11 strong divisions, recently victorious in two campaigns over other organized armies, could be treated as though it were on the military-technical level of a frontier tribe? Actually, it appears that the astonishment and dismay of the commanders, from army down to and below division commanders, at the incomprehensible sequence of events was no small factor in the issue.

Of the conduct of operations on the Serbian side it need only be said that Putnik's management of his forces in space and time, and the choice of the moment and place of counter-attack, were masterly. To gain great results, the risks of a forward concentration were accepted, but always under such conditions that the chances and profits of success were greater than the chances and losses of defeat. The object was limited, but its attainment complete without remainder.

At the same time, in this as in many other instances, the idea of a limitation of objective has been criticised *per se*. Only a detailed reconstruction of the conditions at the moment of the counter-offensive would make a final judgment to be formed on the question in the present case; and for that the materials not only have not been published but are probably not even in existence, since the bulk of the Serbian archives were destroyed in the autumn of 1915. But this much may be said, that the Serbians were, in point of ammunition and transport, ill-equipped for a great strategic pursuit either into Bosnia or into Hungary, that the great battle in Galicia was only just opening; and its consequences could scarcely be foreseen, and that the strain of the forced marches imposed by the forward concentration, followed by that of hill fighting, had told heavily on the victors.

¹ The Syrmian Operation and the Massed Austro-Hungarian Command of the V. Army, von Frank, protested against the hurry and only submitted to a formal order.

Attack.—The Yadar and Shabats operations closed, then, on the river line, but meanwhile no events had taken place on the front E. of Obrenovats, and the Austro-Hungarians were palpably withdrawing forces by all railheads between Weisskirchen and Mitrovitsa, and after a short rest the Serbian command decided to push an offensive over the Sava into Syrmia (Srem), the sub-district of Hungary lying in the angle between the Sava and Danube. In this region were three of the six railheads at the enemy's disposal and an important lateral line. Its occupation would therefore thrust back the line of deployment of any future attack from the N., and the new front to be held defensively at the further limit of the occupied area would lie in and across the Fruska mountain range (the Mitrovitsa-Peterwardein), and thence along a part of the Danube which was exceptionally strong as an obstacle—owing to the marshes and channels at the confluence of the Theiss—to Semlin and the old Danube front. This gained, it would be possible to embark upon an invasion of Bosnia without fear of a sudden attack in flank and rear.

As early as the 26th, two days after the reconquest of Shabats, Putnik issued general instructions regrouping the army for the new project. The II. Army (now to consist of Morava I., Timok I., Timok II., and "Combined" divisions) was to occupy and defend the Lower Drina to Lyeshnitsa exclusive. The III. Army (Drina I., Drina II., Morava II.) was to hold from Lyeshnitsa inclusive to Zvornik. A special detachment, reporting directly to G.H.Q., was to hold the crossings below and at Lyuboviya. The I. Army (Shumaja I., Danube I., cavalry division) was to assemble towards Shabats and prepare to force a passage into Syrmia. The Belgrade and Pozharevats groups were to continue in their defensive missions, the former to be prepared to coöperate with the I. Army in the capture of Semlin, the latter to dispatch its principal formation, Danube II., to Obrenovats for Sept. 9. The Uzhitse Army was to continue its mountain offensive towards Visegrad, in concert with the Montenegrin Plevlye group. The date of the Sava crossing was to be ordered by G.H.Q., and meanwhile the II. and IV. Armies were instructed to reconnoitre crossing places on the Drina line, and to obtain all possible intelligence as to the condition of the enemy in their front.

A pause followed, while the preliminary work was being carried out and the I. Army being marched over from the Morava valley. The enemy was occupied with reorganization, and with the reliefs and takings-over consequent on the withdrawal of the II. Army. On the whole northern front there remained one post-line division only, the 29th; along the rivers themselves were Landsturm formations. Yet Potiorek was in fact contemplating a new thrust on the Drina; and the 29th Div. was ordered to be ready to coöperate by forcing a passage of the Sava at Yarak. Thus it befell that the division was grouped between Huma, Yarak and Nikinci when the Serbian offensive was launched. Apart from it, there were no formations in Syrmia other than the regiments holding the thin surveillance line.

On Sept. 3 General Krauss, commanding the 29th A.H. Div., received word that the Serbs intended to force the passage of the Sava below Mitrovitsa. This report he more than half-disbelieved, and in any case, regarding Mitrovitsa-Yarak as the centre of gravity of the Serbian offensive into Syrmia, he was content to leave his forces grouped as they were for Potiorek's intended advance. This was to take place on the 7th, and for it the 7th Inf. Div. was added to Krauss's command, henceforward known as the "Combined Corps Krauss."

On the night of Sept. 5-6, the Serbian preparations being complete, the passage was forced in two places, between Mitrovitsa and Yarak by Timok I. of the II. Army, and at the Kupinovo loop by the I. Army. The former, intended more as a demonstration than an operative crossing, was successfully achieved, but the eager troops pressed on without making a bridgehead, fell into the midst of Krauss's troops and, driven back on the river, were overwhelmed in the attempt to recross, five battalions being completely destroyed.

The Kupinovo division, on the other hand, secured their position with a bridgehead line before pushing on. Fortune favoured them, too, for the defence here consisted of Landsturm forces

directed by a headquarters at Peterwardein, and Krauss, bound to Yarak by his orders to coöperate in Potiorek's Drina offensive which had not been cancelled, only sent his newly arriving 7th Div., piecemeal, to assist the Landsturm in holding the Syrmian plain. This was, of course, unknown to the Serbian I. Army, which developed its advance cautiously across the plain and by the night of the 8th occupied a front from Platicheno near Klenak by Brestac round to Progar. In the next days, the left stood almost fast while the right pushed out, cleared a passage for the troops at Obrenovats, and by a threat to the rear of Semlin forced the enemy to give up that place to the Belgrade forces. Lastly, the right of the line swung up with its flank on the Danube and its centre on Gorubintsi; the intention was to bring this right wing by a wheel into the W. part of the Fruska range and so to make good the line across that range from river to river which was the objective, without losing men in a frontal battle against the enemy's strong forces about Huma and Mitrovitsa. For three more days it was persisted in, then on the evening of Sept. 11, owing to the situation of affairs on the Drina front, it was given up. On the 12th, 13th and 14th a methodical retreat, with which Krauss's 20th Div., though released at last from Mitrovitsa-Yarak, was unable to interfere seriously, brought the Serbian I. Army and Belgrade and Obrenovats forces back to their original positions whence the field divisions were hurried with all speed to take part in the new battle of the Drina.

Potiorek's second offensive had opened on the night of Sept. 7-8. The VIII. Corps (with which originally the 20th Div. was to have coöperated) bordered the Lower Drina as far up as Bielyina, the XIII. from that point to Kozluk, the XV. thence to Zvornik, and finally the major part of the XVI. corps opposite Lyuboviya, the remainder, as in the previous phase, facing the Uzhitsa Army and the Montenegrins. The Serbs were, as the result of the Yadar operations and the proposed offensive into Bosnia, deployed in strength, and this, on the one hand, increased the probability of repulsing any given attempt, but on the other made it more difficult to deal with any break-through that might actually occur, as the defence system lacked depth.

The attack began with the VIII. Corps. Here it only succeeded in establishing a bridgehead in the N.W. corner of the Machva, covering temporary bridges at Parashnitsa; and the expected coöperative attempt of the 20th Div. at Yarak was not made, as, by the date fixed for this coöperation (the 9th), Krauss had concluded that the failure of the VIII. Corps was too clear, and the situation in Syrmia too critical to allow it.

But farther S., on the front of the XV. Austrian Corps and the right of the XIII., the Serbians' III. Army had more difficult conditions for defence, and on the night of Sept. 8-9 the passage was forced first at Brasinski Han and then at Zvornik. Crossings followed at other points farther up as far as Lyuboviya. The Serbs were forced back to the Guchevo-Boranya-Yagodnya ridge.

By the 11th the situation on this wing was serious enough for the Serbian command to order the cessation of the Syrmian offensive and the transfer of the I. Army with all possible speed to the region of Valyevo-Petska.

Meanwhile, local reserves gathered from behind the centre had been dispatched to establish a front Yagodnya-Brankovac-Rozani-Proslop. Behind this line, the reassembly of the I. Army about Valyevo was to take place. Its headquarters were ordered to Valyevo, its forces to the same point as a preliminary to concentrating about Petska, whence the enemy was to be attacked in flank and rear towards Krupany, Zavlake or Osechitsa, according to the amplitude of his presumed sweep. The definite line of resistance on which battle was to be accepted if the Austrian pressure was maintained, was from the Dobrava S. of Shabats to Brestovats and Tser ridge (II. Army), thence in the hills about Zavlake or about Osechitsa (III. Army), according to circumstances, to whatever point on the Petska-Valyevo road the concentrating I. Army¹ was able to reach in time.

¹ To aid in this concentration, only the Danube I. Div. was to be disengaged at once in Syrmia, and the army was to be reconstituted by this division's picking up *en route* Danube II. from Obrenovats and a division of the II. Army from Tekerish. This latter did not join, becoming absorbed in the lower Yadar fighting.

Two days later the situation was suddenly modified again. On the night of 12-13th parts of the Austro-Hungarian XIII. Corps began to cross the Drina at Kuriachista, midway between Lye-shnitsa and Loznitsa, opposite the left of the II. Serbian Army, which was by now weakened through giving up local reserves and taking over an extended front for the benefit of the III. Army. This new move threatened not only to cut the Serbian line in two, but to roll up the whole Guchevo-Yagodnya position by a drive along the Yadar valley behind it.

With this, the battle becomes too tangled for brief description. Though the particular threat from Kuriachista was soon ended, the left of the Austro-Hungarian XV. Corps developed strong attacks on Loznitsa. The struggle for the W. end of Guchevo ridge and the lower part of the Yadar valley was fed from day to day by successive reinforcements arriving on each side. Here, minor contests for the possession of minor ground features, attempts to hold a hill long enough for it to be crossed with guns, or to storm it before it could be crowned, went on for days collaterally with the pressure exercised by the Austrian mountain troops of the XVI. Corps on the left of the Serbian III. Army, until the forces of the Serbian I. Army began to appear on Sept. 15. Next day, with a considerable force in hand, the I. Army staff mounted a counter-attack which bore back the Austrians from the line W. of Kostaynik-Sanats (pt. 835)-Sokoloka Planina-Petska, to one which on the evening of the 18th ran from W. of Kostaynik-Sanats-Veles-Karashitsa-Lyuboviya. Then, with further Serbian gains to the right of Sanats, fighting died away all along the line and trench warfare set in on the front from Kuriachista to Lyuboviya, the Austrians and Serbs facing one another on the line Guchevo-Boranya-Yagodnya-spur S. of Yagodnya.

On the Machva front, meanwhile, the offensive of the VIII. Corps, which had at first obtained only a bridgehead at Parashnitsa, was resumed in combination with a crossing at Yarak by Krauss's corps, when Syrmia had been evacuated by the Serbs. Here also, after violent but narrow-fronted attacks, trench warfare set in on the line of the two bridgeheads (N. of Shabats-Glushtsi, and Ravnye-Serbian Racha) which on Oct. 31 were united in one by a successful advance of the VIII. Corps from Ravnye to Glushtsi.

The second phase had been very different from the first. The Austrian staff had taken their opponent seriously, and laid their plans carefully, and it was only after the greatest exertions and very heavy losses that the Serbs had succeeded in pushing back the invaders. Even so, the latter had mastered the greatest part of the river obstacles, and in the absence of aircraft on the side of the defence, could carry on all preparations for a fresh offensive, unseen behind their firmly held trench-line.

Meanwhile, the Uzhitsa Army and the Montenegrins, who at the close of the first phase were following up the retreating Austrians towards Vishegrad, had developed a series of operations which, like the expedition into Syrmia, were designed to prepare the way for a serious offensive of the II. and III. Armies over the Drina. This being forestalled by the Austrian offensive, the operations of the Uzhitsa Army and its allies were without practical effect. They were, however, vigorously conducted.²

² On Sept. 4 Golea Height, S.E. of Vishegrad, was stormed by Shumaja II., while farther up the Drina, other Serbian and Montenegrin forces attacked at Ustipratsa, Gorazda and Focha. At the latter place the Montenegrins broke through on Sept. 11, and a raid was pushed deep into the enemy's country, while a number of simultaneous attacks at Gorazda, Ustipratsa, Vishegrad and Bainabashita caused the Austrian 8th Mountain Brigade to draw back to Han Pesak and Srebenitsa, when it crossed the rear of its Corps (XVI.) fighting N. of Lyuboviya. This and the other Austrian mountain brigades, however, maintained an active war of raids and expeditions in the mountains. The Montenegrin main body, from Focha, moved E. to Kalinovik, which it captured and then evacuated. Other Montenegrins from Focha and Serbs from the Vishegrad and Rogatisa region threatened Sarajevo for some time, though periodically cleared away by expeditions of the mountain brigade from Sarajevo and the 8th Mountain Brigade from Srebenitsa and Han Pesak. Meanwhile, the bulk of the Serbian Uzhitsa forces (Shumaja II.) advanced by Han Pesak on Vlasenitsa, and also to Srebenitsa. Indecisive fighting took place at the former during the last of September and the first of October, but at Srebenitsa the threat to the rear of the Austrian XVI. Corps was dissipated.

The Kolubara Campaign.—The course of the war during September and October had not been favourable to Austria-Hungary. Galicia had been lost, and the line of battle had receded W. until it lay in the region of Lodz-Cracow-the Dunajec and the Carpathians. In November, the campaign in the western theatres had ended in deadlock. Falkenhayn had succeeded to the control of German operations, and his doctrine of wearing-down strategy was taking shape. Winter was at hand.

Nevertheless, Potiorek meant to resume active operations. No hindering order prevented him from doing so. Conrad's instructions were that he was to prevent an irruption of the Serbs into Austro-Hungarian territory, but it was left to him to decide whether that defence should be passive or conducted offensively by partial attacks. The Emperor expressed the wish that Potiorek would succeed in defending the monarchy, to which the *Feldzeugmeister* replied that he "hoped to do a good deal better than that." Falkenhayn, with his wider outlook, suggested a sudden seizure of the N.E. corner of Serbia with the view of opening up a line of munitions transport to Turkey, but this project aroused no interest at the headquarters of the "viceroy" of Bosnia, who was resolved to drive another offensive into Serbia with all his might, at the first favourable opportunity.

The Serbians meanwhile had suffered severely from the unfamiliar conditions of trench warfare, notably in the Machva, and at the end of October Putnik had decided to evacuate the line in that quarter. The Austrian attack of Oct. 31, therefore, met with only outpost resistance, and Shabats was occupied two days later, while monitor activity continued on the rivers.¹

The advance of Krauss and the VIII. Corps in the Machva was the first stage of the new general offensive. On the night of the 4-5th it was developed by a frontal attack from Shabats combined with a fresh crossing at Mishar, the Serbians continuing their retreat to the line N. Dobrava-Dobrits-Tser ridge. On the next night (Nov. 5-6) a heavy bombardment opened along the whole Austrian front, especially on that of the Guchevo range. On the 6th, infantry pressure began along the mountains from the W. end of Guchevo as far as Yagodnya. Once more, evidently, Potiorek intended the centre of gravity of his attack to be on the right and right centre, the front of his own army composed of mountain troops long familiar to him, and well equipped for the work. On the 6th, from the slopes of Guchevo itself he issued a proclamation, stirring his troops to the highest efforts by promising them this time the "annihilation" of the "exhausted" enemy. Nor were these empty words, for the condition of the Serbian *moral* at this time and their shortage of ammunition were evident.

At this opening moment, the dispositions and order of battle on both sides were as follows:—

Serbian II. Army (Vidovevitsa-Dobrava): Morava I., Timok II., Shumaja I., Timok II., Cav. div. and details; 63 battalions, 27 squadrons, 34 batteries.

III. Army (Yadar-Kostaynik): Drina I., Drina II., Combined Division; 40 battalions, 6 squadrons, 18 batteries.

I. Army, under Hoyovish (Kostaynik-Uzovnitza stream and Drina): Morava III., Danube I., Danube II. (temporarily de-

pated by a counter-attack of the 8th Mountain Brigade when that formation returned from an expedition in relief of Sarajevo. The Serbian column retreated whence it had come, to Bainabashta. Finally, when on the main front much warfare set in, the Serbians and Montenegrins began slowly to retire to their respective frontiers, while on the other side a systematic drive was carried out by large forces of the XV. and XVI. Corps. One Austrian group advanced from Sarajevo E. on Rogatitsa, and won a severe engagement on Romanja Planina on Oct. 21-22. While another following up the retirement of the Serbs from Vlasenitsa advanced on Rogatitsa from the N. The Montenegrins between Focha and Katinovik did not give way without inflicting severe losses on the group opposed to them. But by the end of October all the allied forces had withdrawn behind the Drina. Farther S., the region of Artovats was again the scene of some irregular fighting in October.

¹ During October, there had been many local engagements on the Danube-Sava front. Belgrade was frequently bombarded. The defence was very active, and minefields were placed at several points, to one of which, near Shabats, the monitor "Temes" fell victim on Oct. 23. In the main, however, the Austrians kept the upper hand.

tached to II. Army); Lyuboviya detachment; 44 battalions, 9 squadrons, 24 batteries.

Uzhitse Army, under Aratich (along Upper Drina from Tirye-shnitza stream to the Lim, front continued thence by Montenegrins): Shumaja II., Lim detachments, Uzhitse Brigade; 34 battalions, 2 squadrons, 12 batteries.

Belgrade Detachment, under Zhivkovich (Brestovik-Pechani): 17 battalions, one squadron, 9 field and some medium batteries.

Obrnovats Detachment (Pechani-Vukodrazh R.): 6 battalions, 3 batteries.

Branicevo Group and Kraina Group (Brestovik-Kladovo): 12 battalions, 4 batteries.

(The three last-mentioned forces were on the river front.)

Serbian total: 226 battalions of all categories, 41 squadrons, 113 batteries, modern and B.L.

The Austro-Hungarian forces and dispositions, as established by the Serbians, were as follows:—

River front from Shabats E.: 55 battalions, almost entirely Land-sturm.

Shabats-Machva-Lomitsa front (V. Army, in order from left to right Krauss, VIII., XIII.): 87 battalions.

Lomitsa-Lyuboviya (VI. Army, XV., XVI. Corps, 40 Honved Divs., and other troops): 110 battalions.

South-west of Lyuboviya: mountain troops (1-2 brigades).

On the 7th, the VI. Army attacked and pushed the Serbian III. Army off the entire Guchevo ridge, and bore back the I. Army² and the right of the Uzhitse Army till the latter, marking the extreme left of the battlefronts, stood on Trsvana Stena.

On the 8th the retrograde movement of the III. and I. Armies continued to the line Kozaningrad (pt. 706) on Tser-Strasha (1424)-Zavlaka-Petrina Stena-Proslap. Meanwhile, the Serbs on the Machva retiring to the line Kozaningrad-the Dobrava were under strong pressure. Next day, in the midst of general activity on the water, an Austrian regiment forced the passage of the Danube at Semendria, threatening an inroad in the Morava valley itself, and part of the Belgrade force was hurried E. to deal with this threat, which it did successfully.

The reports from the front had already decided Putnik to withdraw to a line covering Valyevo, viz. Obrnovats group, Kolubara mouth to Skela; II. Army, Ub-Blizonzhski heights; III. Army, Yantina-Kamenitsa; I. Army, Yollna Breza-Sovachki Kik; Uzhitse Army, right Trsvana Stena-centre and left Vishegrad to river Lim. But it soon became apparent that a stand could not be made on this line. *Moral* was low, with mixture of units considerable. In the two Drina divisions of the II. Army in particular men feared for their families and considerable numbers left the ranks and made their way home, while accompanying the retreat were hundreds of refugee families with their carts and beasts, fugitive or requisitioned. From the interior, new drafts came up in thousands and congested Valyevo.

Though the army was by no means in dissolution, it was undisguisedly in full retreat. By order of G.H.Q. communications were destroyed in the retirement.

The line now to be taken up was the so-called "Kolubara line," which from the rear followed that river to the confluence of the tributary Lig, then, by the Lig to Gukosl and thence by height 700 to the Malyen ridge at Malyen (point 997). The Kolubara part of the line (with a defensive flank along the Sava) was to be held by the Obrnovats group; from just below Lazarevats to Malyen inclusive was allotted to the II., III. and I. Armies west. The Uzhitse Army was to leave one brigade at Kadinyacha on the ridge between Rogatitsa and Uzhitse, the remainder astride the Vishegrad-Uzhitse road at Shargan.

By the evening of Nov. 14, the Obrnovats detachment had taken up its positions behind the Kolubara, the II. Army had fallen back from Kotsielevo towards Lazarevats and the Middle Kolubara, the III. Army, always manœuvring so as to extricate its right before its left could be turned, was astride the Yadar-Valyevo road at the water parting about Kamenitsa, and the I. Army continued the line S. to Velovitsa, with its Rogatitsa detachment (somewhat out of touch) pushing the left in the

² The I. Army was short of Danube II., which had been taken to strengthen the II. Army N. of Tser. Habitual disregard of the order of battle, i.e. an unnecessary regrouping, has been criticised as a peculiar failing in the Serbian method of conducting operations. Often, of course, there was no alternative. But there seems some justification for the criticism, nevertheless.

higher mountains. By the evening of the 16th, the positions were:—Obrenovats group, Obrenovats-Konatitsa; Cavalry division, Konatitsa-S.W. of Stepyevats; II. Army, Voluyak-Lazarevats-Chavka; III. Army, Chibutkovitsa-Ivanovatsa; I. Army, Gukoshi-Mednik-Bachinovats-Ruda-Malyen; Uzhitse Army, right S.E. of Yasenovats-Yelova Gai, and left Shargan and Leshka Gora.

The weather was terrible, but Potiorek, sure of success, drove on his troops to new efforts, although communications became worse and longer day by day. On the 17th the cavalry at Konatitsa was threatened, and had to be reinforced, while the mountain troops of the XVI. Corps, pushing along the ridge of Malyen, reached Strazara (pt. 1000). On the 18th the position of Choka on the front of the II. Army was attacked. But the main bodies of the invaders' columns were not yet up to the front. The Serbs thus enjoyed a relative respite, and their left, at Malyen, was able to reestablish patrol communication with the Uzhitse Army.

On the 19th the Austro-Hungarian main bodies began to exercise general pressure, their efforts being specially directed on the angle of the Kolubara and the Lig, and on the point where the line crossed the Yadar river (Gukoshi and Mednik heights). On the 20th the battle followed the same course, and Putnik ordered an offensive to be resumed on both flanks. But the time was not ripe, and the army and divisional generals reported themselves unable to carry it out.

On the 21st the Austrian XVI. Corps broke the Gukoshi-Malyen line in its centre and the defence was brought back to Gukoshi-552-Rayats-Suvobor-Malyen, and on the 23rd the Malyen position was evacuated and touch with the Uzhitse Army again lost. Nothing now intervened between the XVI. Corps and the head of the western Morava valley, but the weather and the distance of its supply sources, and the liability of the convoys to be cut off by descents of the Uzhitse Army, imposed caution, and for some days only minor fighting occurred here.

In reality, it was not here that Potiorek intended to win his victory, but farther north. The initial phase of the operations was complete when Valjevo was in his hands, and secured against attack from the S. by a sufficient foreground. The next was to be the driving back of the Serbs from the Lower Kolubara, the cutting off of Belgrade, the opening of the Obrenovats-Valjevo railway for supply, and finally the advance in the dry and not too hilly country N. of Lazarevats into the Morava valley, accompanied in its last stages by a descent upon Chachak and Gorni Milanovats in the enemy's rear.

The weather had, however, converted the poor roads of the Ub country into deep mud, and the regulation military transport foundered in this mud, so that the intended rapid advance by Krauss and the VIII. Corps to the Kolubara had been impossible. The mountain troops had outpaced the scheme, and it was not till the 22nd that the Austrian V. Army was able to open a real attack on the Kolubara. By the 25th it had made good the passage, but progress was slow, and at that date only Chopka and Konatitsa had fallen. Obrenovats still held.

Putnik had now resolved to give up Belgrade. Ammunition was expected, but had not arrived. Moral was becoming lower and lower, and only ruthless concentration on essentials would enable the army to last till the day when, with pouches and wagons refilled, counter-offensives could be launched. Meanwhile, his policy was to fight for time, so as to evacuate Belgrade as thoroughly as possible.¹ Then the Belgrade and Obrenovats forces were combined and posted on the line Varovnitza-Kosmail-Sibnitza (night of 29-30th), in touch on the right with the Pozharevats (or Branicevo) force, which held the Danube front astride the Morava. The Austrians entered Belgrade on Dec. 1.

On Dec. 2 the Serbian positions were as follows:—

Belgrade-Obrenovats force, Varovnitza-520-313-Rogacko Brdo-281. II. Army (4 divisions and cavalry division), Sibnitza-Olbrezak-Ravani (318)-Medvednik (365)-Vayan (490).

¹ Some French naval guns had to be blown up, as they could not be removed. Before destruction they fired all their ammunition into Bezania.

III. Army (3 divisions), Mramor (398)-Kalanyevitsa-489-320-Motika (603).

I. Army (4 divisions), (now commanded by Mishlich), Nakuchani-Vrnchani-Sinoshevtai-Galich (703)-Vuskova Glavitsa.

Uzhitse Army (equivalent of 2 divisions) Kita-Kablar-Ovchar-Markovitsa.

On the Austro-Hungarian side they were:—

V. Army: Combined Corps and VIII. Corps, area E. of Lower Kolubara and S. of Belgrade; XIII. Corps, Arapovats-Trbushnitsa-Parlog-Liplje.

VI. Army: XV. Corps, Vrlaya-Golubats; XVI. Corps, Vranovitsa-Leusitai-Ruyevitsa (583), detachments Godun, Pozhega, Arilye.

Both opponents were by now almost worn out. Suffering from their exertions, their losses, and the absence of food, shelter and ammunition, they were held together only by the inertia of the system. In this condition victory would fall to that side which first found a stimulus. This came to the defenders in two forms, the example of the old King, who took a rifle and fought in the ranks, and the arrival of the long-expected ammunition.

On the night of the 2nd, while Potiorek was slowly regrouping his forces to develop the attack on his left, Putnik issued orders for a general offensive S. of Sibnitza "in order to profit by the enemy's present weakness and raise the moral of our troops."

The II. Army was to drive the enemy over the Kolubara; the III. (Drina II. and "Combined" division) to push towards the old line on the Lig; the I. to make good the line Krivareka-Lozany-Teochin (in order from right to left, Timok II., Morava II., Danube I., Danube II.); of the Uzhitse Army the available portion of Shumaja II. to attack N. and N.W. along Pranyani and Gojna Gora; the Lim detachment to attack between the Lushnitsa and Venchaska streams by Breziak N.; the remainder of this undispersed army standing fast or forming a defensive flank for the advancing centre.

The counter-offensive was delivered or launched on the morning of Dec. 3, and was quite unexpected by the Austrians. The Uzhitse Army's offensive wing reached a line astride its assigned ridges marked by Ruyevitsa and Godun. The I. Army drove the XVI. Corps back to the line Byezna-Ozrem-Kriva Reka. The III. Army reached the line Vrlaya-Lipet, the I. Okressak-Barosevats-205-347, while on its right the cavalry maintained contact, at Slatina, with the defensive right flank, the Belgrade-Obrenovats force.

Next day the Uzhitse Army's advance was sharply arrested, and it only maintained its ground on the line 370-Ruyevitsa-Godun-Oruyewitsa-Krstata. But the I. Army drove a deep wedge, and by nightfall occupied Golubats-Prostruga-Rayats-Suvobor-Babina Glava. The III. and II. Armies met with stiff resistance. The III. made no progress, and the southern wing of the II. was hung up by the unshaken resistance of Kremenitsa; the N. wing reached Arapovats and Sakulya. No serious fighting occurred on the part of the cavalry or on that of the Belgrade-Obrenovats force, and the commander of the latter, fearing that an envelopment was in progress, extended his right to the heights E. of Grotaka. Next day Putnik, conscious also of the danger of allowing the regrouped Austrians to break through into the Morava region and envelop his right, caused the II. Army to extend its right (Timok II.) past Vitnitza to Kosmay heights, behind the cavalry. The attack of the centre was in fact at a standstill, and it was evident that it was impossible to defeat the enemy's leftward regrouping of flank attack.

On this day (Dec. 5) the Uzhitse Army's attack, numerically weak and divided amongst several directions, came to a standstill. But the success of the I. Army on the ridge of Prostruga was made definitive, the Austrian XVI. Corps brigades retiring N. towards the Kolubara with heavy losses.

On the 6th the I. Army pursued its opponents N. and downhill towards Valjevo, while on the left of its flank the Uzhitse Army made advances N., N.W. and W. against weakening opposition, and on the right the III. Army reached the line of the Lig. But simultaneously, the storm broke on the extreme right, where the slowly prepared attack of Krauss and the VIII. Corps was launched at last. The line of defence held, but Timok I. from the II. Army was set in motion for the extreme right.

On the 7th, while the I. and Uzhitse Armies continued their advance to Valjevo and Uzhitse respectively—their opponents withdrawing divergently on the Loznitsa and Shabats routes—the III. turned the flank of the defenders of Kremenika and thus enabled the II. Army, weak as it now was, to make progress towards Lazarevats and Voluyak height. But on the right the Austrian attack made real progress and approached the advanced line of the Kosmay position. On the 8th and again on the 9th the Kosmay line itself was taken and retaken. On the evening of the 9th the alignment of the Serbian defensive flank was from the Danube E. of Grotzka, by Umchari, Varovnitza, and Kosmay to the Kolubara valley near Sakallia. Lazarevats was reoccupied by troops of the II. Army on the 9th, and the III. Army, coming up into line with the I., bordered the Kolubara as far as Valjevo, these two armies beginning the pursuit of those Austrian forces which had taken the Shabats direction in their retreat.

The 9th was in fact the turning-point of the battle, as the 3rd had been that of the campaign. On the evening of that day Potiorek, ill informed of the state of affairs in the N., and deeply impressed with the defeat of the mountain troops (VI. Army) which he had himself accompanied and directed, gave orders for a general retreat on Belgrade, Shabats and Loznitsa. On that day also Putnik issued general directions for the continuance of an offensive which was evidently yielding much greater results than those aimed at in the instructions of Dec. 2.

The position of affairs on which the new scheme was based was: heavy and apparently increasing pressure on the Kosmay front (VIII. and Krauss), indicating an attempt to break through into the Morava region; stiff resistance of the enemy (XIII. Corps of II. Army) between that front and the Kolubara, and on that river astride the Ub routes; and full retreat of the Austro-Hungarian XV. and XVI. Corps in the divergent directions of Shabats, Loznitsa and Vishegrad.

Putnik's objects were two: to follow up the retreating XV. and XVI. Corps quickly so as to regain possession of the national territory and rescue the inhabitants, and to attack the enemy northern forces frontally and in flank before they could prepare a winter position on the Belgrade loop. Attacked all along the front and threatened on their right, he hoped that the Austrians would evacuate the capital without ruinous street-fighting. Some hopes were no doubt cherished of cutting off the retreat of the two corps (VIII. and Krauss) but they were slight. The physical conditions were adverse. "Our national mud," hitherto Putnik's ally, became now a hindrance.

On the 10th, therefore, the Uzhitse Army continued to pursue in the direction of Bainabasha and Rogatitsa, part of the I. Army pushed along the Loznitsa road, part towards Shabats, while the III. Army, with its left already over the Kolubara S. of Ub, began to wheel to the N., pivoting on Lazarevats, with the outer flank following the direction of Ub-Obrenovats.

But already on that day, the battle at Kosmay diminished instead of increasing in intensity. The Austrians began to draw back. Hopes of completing the wheel of the III. Army vanished. The Austro-Hungarian XIII. Corps gave ground only slowly. The renewed *moral* of the Serbs had sufficed to give them victory, but it could not force them through the phase of exploitation, when it was evident that the enemy was evacuating the country of his own accord and also that he would not be hustled. Had the Ub-Obrenovats direction been assigned to troops of the I. Army, which alone of the five larger formations had really experienced the sensation of clear victory, it is possible, though by no means certain, that the envelopment might have succeeded. As it was, the last phase of the battle was practically a frontal drive E. of the Kolubara, with heavy local fighting and the glancing of prisoners and spoil, but no *débâcle*. When on the 13th the left division of the III. Army seized Obrenovats, the Austrians had already withdrawn clear of the flanking threat. They had, owing to the state of the VIII. Corps, decided not to make a stand on the Belgrade loop, and after one day's further fighting, they evacuated Belgrade which the Serbian patrols reoccupied at 10 A.M. on the 15th. Meanwhile, Shabats, Loznitsa and Bainabasha

had been reached and reoccupied by the pursuing columns of the I. and Uzhitse Armies.¹

The recovery of the country and the capital intact, and the capture of 41,000 prisoners and 133 guns, with large quantities of stores, even though no Sedan had been achieved, constituted a victory that was both decisive and—after a crisis of *moral* such as that of the end of November—wonderful. It gave Serbia peace in the midst of World War for a few months to come. But her losses had been very heavy. In the three battle periods of 1914, 69,000 Serbian soldiers had been killed or had died of sickness, perhaps 15,000 had been taken prisoners, and probably 180,000 had been wounded, out of a mobilized force which at the outset numbered 490,000.

II. THE CONQUEST OF SERBIA, 1915

When the third punitive expedition ended in failure, Potiorek was relieved of the command, and the V. and VI. Armies were fused in one called the "Balkan Forces," to which the Archduke Eugene was appointed as commander, with Krauss as his chief-of-staff. Under cover of outposts along the rivers, the corps were reorganized and disposed for the defence of Hungary. Soon the VIII. and XIII. Corps were withdrawn for service in other theatres, and on Italy's entry into the war the Archduke and Krauss were transferred to Laibach to command the new front, General Tersztyanski being left with a much weakened force opposite the Serbs. The latter indeed were not fitted for the offensive. Not only were their numbers greatly reduced by the battles of 1914, but an epidemic of typhus devastated their ranks still further.

Meanwhile, Falkenhayn, reasoning not in the spirit of a Bosnian viceroy who wished to teach a lesson, but in that of a modern war-manager, had become convinced of the necessity of opening a road to Turkey for the transit of munitions and expert personnel. The desire to reserve or to recoup forces for this purpose went so far, indeed, that he constantly imposed a brake on Hindenburg's and Conrad's proposals for decisive operations in the Russian theatre. At one time in the spring, the beginnings of a German army were assembled in Hungary, though the scheme—at that period only one of clipping off the N.E. corner of Serbia—was abandoned before effect had been given to it. Later, when the first fear of the Italians had died away, and the Russian campaign was nearing its end, it was taken up again.

Throughout the spring and summer negotiations had been in progress for winning, or buying, Bulgaria's active support. Falkenhayn exercised all his influence to keep these alive, even under difficult circumstances, for though Bulgaria's price was high, without Bulgarian aid no forces that could be spared from other fronts would suffice for the clearance of the Orient railway, while the nature of Bulgaria's reward imposed the conquest of Macedonia in addition to the military occupation of N. Serbia. There were, further, internal difficulties between the two allies on the question of command. Bulgaria insisted on a German commander as chief, and found in this matter, naturally, Falkenhayn's entire support, but Conrad, ever jealous of the prestige of the Austro-Hungarian army and hostile to German control, long refused his consent. It was not, indeed, until the verge of the offensive that a formula acceptable to all these states was discovered.

The plan of operations adopted was the reverse of Potiorek's, and was substantially that proposed by Krauss and by Tersztyanski successively, viz., direct attack over the Sava and Danube, coupled with a coöperative attack from the Machva, for the securing of the Kolubara line and its railway. But it had the further element of Bulgarian intervention on the right rear of the defence which, if energetic and controlled as to timing and direction by the same commander-in-chief as the frontal offensive, would be decisive. The appointed commander-in-chief of the group of armies was Mackensen. He was to have under him the reconstituted XI. German Army (Gallwitz), the reconstituted

¹ During the period of the Kolubara campaign, there was a certain amount of minor fighting between the Montenegrins and the Austrian forces of Bosnia and Herzegovina, on the Drina, about Artovats, and about Trbinje. No results of importance were achieved on either side.

Austro-Hungarian III. Army (Köves), and one Bulgarian army, the I. Another, smaller, Bulgarian army (the II., Todorov), not under Mackensen's command, was assembled for the seizure of Macedonia. The political treaty of alliance was ratified on Sept. 4, at Sofia, the military arrangements embodied in a convention at Pless on the 6th. According to the latter, within a period of 30-35 days, Germany and Austro-Hungary were to engage 6 divisions each and Bulgaria 4 (each equivalent in infantry strength to 2 normal divisions).¹ Another Bulgarian division was to operate, as above mentioned, into New Serbia (Macedonia).

Accordingly, Köves's army, consisting of the Austro-Hungarian VIII. and XIX., and the German XXII. Res. Corps (seven divisions), was assembled in Syria, and Gallwitz's III., IV. Res. and X. Res. Corps (also seven divisions) in the Banat.

The Bulgarian I. Army (Boyadiev) (1st, 5th, 6th and 8th Divs.) was disposed in the region of Vidin, Kula, Belogradchik and Tsaribrod. The small Austrian forces still available in Bosnia after meeting the demand of the Italian front, were to operate in the Upper Drina region, to hold the Montenegrins in check.

On the Serbian side, there was a definite and perhaps a decisive inferiority in numbers. Battle in 1914 and typhus in 1915 had cost the little country 125,864 dead by Oct. 1 1915, without counting permanently disabled men and prisoners. Gaps had been made good by calling up two new conscript classes, and the ration strength had increased to 572,171 in August. But this figure was far in excess of that available for fighting service—indeed, the German intelligence staff estimated the latter at not more than 200,000.

The Serbian dispositions were generally as follows:—Drina front from the Lim to Bainbashta, Montenegrin forces; Middle and Lower Drina, Machva to Kolubara (exclusive), III. Army (Yurichich-Stürm), 3 divisions; Kolubara to Grotška, Belgrade force (Zhivkovich); the Lower Morava, II. Army (Mishich), 3 divisions; general reserve, Palanka, 2 divisions and cavalry division; in the N.E. angle were the Brancevo and Kraina groups.

On the Zayechar-Knzajchevats front, the Timok army (Goykovich), on the Nish-Pirot route and to the S. as far as Vranja, the II. Army (Stepanovich), and on the routes into Bulgaria, E. of Uskub, Boyovich's group, comprised 4 divisions and 3 Ban formations.

These dispositions, which at first sight seem to dispose in cordon, weak everywhere, at least five-sixths of the available force, indicate not only a sense of the danger impending on the E. side, which the Western Powers had forbidden Serbia to meet by a preventive offensive, but also the hope of assistance from Salonika. The help of Greece was invoked under the terms of the treaty of alliance of 1913, that of the Western Powers had been promised, if tardily and with reservations. To deploy, facing N., with three-fifths of her forces, and to guard the route to Salonika with the remainder, was, in sum, Putnik's plan.

As against an attack supported by artillery on the 1914 scale, there would have been no reason to suppose that this type of defence would be less successful than it had been in the Kolubara campaign. One line after another could be defended, and when the dead point of the offensive was reached, the reinforced defenders would deliver the counter-stroke of reconquest.

But tactics, unhappily for Serbia, had advanced since 1914, notably German tactics. Discreet reconnaissances, under the direction of the German Lt.-Col. Hentsch, chief-of-staff of Mackensen's group of armies—the same who had borne so grave a responsibility at the Marne—had been carried out for weeks past, for the purpose of fixing of battery positions and working out technical details of the Sava and Danube passages. Searchlights were assembled, large troop barges constructed, and for the protection of the main crossings heavy artillery was massed.²

¹ An interesting sidelight is thrown on the relations of the allies by the fact that Germany thought it necessary to require from Bulgaria a written guarantee of unimpeded transport freedom through Bulgarian territory.

² In the case of the Belgrade crossing, no fewer than 20 batteries of heavy and superheavy artillery were collected, nearly half of which consisted in 30-5 and 42-cm. howitzers, and 18-cm. long guns. In addition, about 90 field guns and howitzers were engaged.

Oct. 6 was fixed as the initial day for Köves³ and Gallwitz, the 11th for the Bulgarians.

The bombardment opened on the 5th, laying towns and villages in ruin all along the line; but on the Serbian side only outposts held the river lines, local reserves being kept under cover.

Köves's main crossing place was to be Belgrade, opposite which place technical preparations had been multiplied and two corps out of three assembled. The third (XIX. Austro-Hungarian) was to pass the Drina at Byelyina, and the Sava at Shabats, Kupinovo, Progar and Zabrezh, in order to create bridgeheads and to prevent the defenders from concentrating to the eastward.

Gallwitz's crossings were to take place at Ram and at Semendria, on each side of the Morava mouth, opposite which points lay the railheads, and at the island of Temes Sziget between them; the attack was to be accompanied by a demonstration from Orsova and a Bulgarian threat towards Negotin.

On Köves's front the secondary crossings, especially in the Machva, secured footholds on the S. side of the water, but all attempts to advance out of the waterlogged river valleys themselves were checked (Oct. 7). Opposite Belgrade, in the early morning hours of the 7th, the first boatloads of troops of the VIII. Corps pushed off into the stream under cover of innumerable searchlights, heavy artillery fire, and monitor activity, while a little way up the Sava the XXII. Res. Corps put over its advanced troops into Ostrovo Tsiganliya (Gipsy Island). Zhivkovich had 16 battalions and nearly all the Serbian heavy artillery, including French and British 6-in. guns, to oppose to them. The landing—the only operation in the World War analogous in form and spirit to that of the Gallipoli Peninsula—succeeded, but only after the fiercest fighting was the foothold really made good and room secured on the front of both attacking corps for the passage and deployment of large forces. On the night of 9-10th, Zhivkovich abandoned the attempt to hold the town, and fell back a little way S., on the line Zarkovo-(249)—Visznitsa.

Simultaneously, Gallwitz's 3 corps had been launched, on both sides of the Morava. Preceded by a demonstration at Orsova on the 6th, the left corps (X. Res.) forced the passage at Ram on the night of 6-7th, and drove inland, over the Anatema heights to Kuryatse, threatening Pozharevats from the north-east. The IV. Res. Corps (3 divisions) seized Temes Sziget Island with little difficulty and reached Brežani (Brežani). But the front from Semendria to Gatsko defied the III. Corps, and not only protected the right rear of Zhivkovich, but gave time to Putnik to bring troops from the Machva.⁴

Nevertheless, it was clear by the 11th that the river barrier was lost and Putnik began a steady policy of fighting successive delaying actions on the N. front, while at all costs keeping back the Bulgarians on the right and rear, in order to gain time for the arrival of French and British aid, the first elements of which had already reached Salonika.

On the 12th Mackensen opened the general advance, in the midst of a gale which, known as the *Kossava*, descends seasonally upon the country from the south-east. Köves made slow progress till the 16th, when the Serbians evacuated under pressure the Petrov Grob-Avala-Velika Kamen line, and fell back to Melyak-Ripany—line of R. Ralya.

Gallwitz by that date had enforced the evacuation of Pozharevats, cleared the way for his III. Corps to advance on the Semendria front, and brought his left flank to Bozevats. To the E. of Köves, the Austrian offensive was a simple follow-up of the retiring Serbs, who now attempted no real defence W. of the Kolubara, though small forces with local riflemen delayed the Austrians long enough for the families and the live stock to be evacuated on Valyevo. The Montenegrins, and with them some Serbs, were maintaining a particularly independent struggle between the Yadar and the Lim.

By this time the Bulgarian advance on the right flank had begun, though some days later than had been intended. In the south, Todorov's II. Army (7th Div. with improvised formations)

³ The Drina portion of Köves's army was, however, behind time.

⁴ All Austrian forces in Bosnia were late in their preparations and took no effective part in the offensive.

prepared to threaten the flank of the Salonika railway from Strumitsa, the Ovchepolye from Kyustendil, and Vranja from Trn. The I. Army advanced on the various routes to attack Zayechar, Knyazhevats and Piro; on these the Serbs had advanced to meet them, always with the idea of gaining time, and by the 16th very little progress had been made by the invaders, except by one regiment which by a daring mountain march seized Vranja and cut the railway there. This success weakened the position of the Serbian forces on the Egri Palanka road at Stratsin, and when, farther S., Todorov turned their right by Kochana and pushed cavalry to Veles, they evacuated the Ovchepolye (Oct. 18-19). On the 21st Uskub itself fell into the hands of the Bulgarians and the Salonika line was lost, though a counter-attack recovered Veles from the Bulgarian cavalry two days later.

At that moment for the first time, the French from Salonika came into action, threatening Strumitsa and Todorov's left. It was too late.

On the northern wing of the Bulgarian army, Boyadiev's central columns cut the road between Zayechar and Knyazhevats on the 21st, and farther to the Bulgarian right, Negotin was occupied by the invaders, who there made contact with the Orsova detachment of the XI. Army. The Serbs in this quarter offered little resistance, their rear being already threatened by Gallwitz's progress in the Morava valley.

In that region the fighting had been heavy, the weather severe, and it was not till the 10th that Mackensen's two armies mastered the Ralya line. On the 21st, the date on which the Bulgarians seized Uskub and the French came on the scene at Strumitsa station, Mackensen's N. front was marked by the line Shapina-Selevats-S. of Kosmay. On the 23rd it lay on the line Lazarevats-N. of Arangyelovats-N. of Palanka-Petrovats, and the Serbian eastern fronts began to be in difficulties, though some days were still to elapse before Goykovich's force finally disappeared and junction was effected between Boyadiev's right and Gallwitz's left. In W. Serbia the Austrians from Bosnia were beginning to be active, and the country-side was being evacuated by men, women and children, with their animals and belongings. From Uzhitse as well as from Valjevo, the emigration had set in towards Novipazar.

Putnik's left armies were now falling back concentrically towards Kraljevo-Krushevats, in proportion as his E. front caved in. On Oct. 30, after no light efforts, the XIX. Austro-Hungarian and XXII. Res. Corps of Kövess's army were S. of Gorni Milanovats, the VIII. Austro-Hungarian Corps S. of Raibrovats, Gallwitz's army to the S. of Lapovo-Petrovats. The Serbs had evacuated Zayechar on the 25th, Knyazhevats on the 27th, and after a fierce resistance and repeated counter-strokes from Piro, Stepanovich had retired on Bela Palanka on the 29th. Farther to the S., Todorov's attention had been thoroughly attracted to the Strumitsa side, and the position at Uskub and on the Upper Vardar had scarcely changed.

From Nov. 1 onwards, the final desperate effort was made by the Serbians to gain time for the arrival of the French and British by holding the arc Chachak-Kraguyevats-Yagodnya-Nish-Leskovats. Still the Bulgarians were held back in this phase, but the Germans and Austrians steadily advanced. Kraguyevats fell, with its arsenal, on Nov. 1; Yagodnya on the 3rd, Kraljevo on the same day, Paratyin on the 5th. For some days longer the defence continued stubborn on the S. side of the W. Morava and about Varvarin in the Morava valley, where a salient was held to enable the last elements of the Serbian IV. Army (Goykovich) to extricate itself from the closing vice. But by the 9th the defence on this line was at an end, and Mackensen was preparing the dispatch of the XXII. Res. Corps to another theatre, having received the Alpine Corps (division) in lieu.

On the E. front meantime, Stepanovich's counter-attacks had completely held up the Bulgarians at Bela Palanka, while a great part of the population flowed away through Nish into Kossovo. It was not until Nov. 4, when Boyadiev had received a fresh division (the 9th) and Paratyin had fallen, that orders were given to evacuate Nish, and that centre was held by rear-guards till the 5th. Leskovats resisted till the 7th.

The Orient railway, the objective for which Falkenhayn had planned the campaign, was now clear from Germany to Constantinople, and with his usual economy he was already thinking of withdrawing the German forces to other theatres.¹ The Serbian army, plainly in dissolution, had ceased to be a menace to the Danube monarchy. But new problems were arising—the Albanian question, the problem of Greece and the Allied Salonika army, the question of a submarine base on the Aegean. In all these, each of the three victors had a different standpoint, and fresh difficulties set in between the three Governments. Belonging as they do to the Salonika phase of the Balkan campaigns, these problems will not be dealt with here, and it only remains to describe, briefly, the last stages of the Serbian tragedy.

Substantially, the results of the Bulgarian coöperation had fallen considerably short of what was expected. The tough resistance of Stepanovich, and even of the small IV. Army in the N.E. corner, had kept back the eastern danger until it was too late for an envelopment. Indeed, considerable portions of Boyadiev's army—those oriented on Negotin and Zayechar, if not also that on the Knyazhevats route—were already crowded out of the closing front. For effective envelopment of the Serbian right, there only remained the N. portion of Todorov's II. Army, and, with the increasing arrival of French and British in the region of Rahovo and Doiran, this Bulgarian general was obliged to be cautious, while encircling attack upon the Serbian left was practically excluded by the fact that the Bosnian forces had made a late start and were traversing very difficult country. Supply and weather conditions, moreover, were becoming serious for the invaders. Practically, nothing could now prevent the remnant of the Serbian army from escaping into Albania, should it choose to do so.

But for this desperate measure, which would involve the loss of all war material and of many thousands of lives in the roadless, snow-bound interior of Albania, the Serbian command was not yet prepared. It seemed preferable to attempt to break through towards the S., where the long-expected Allied army was now advancing and Todorov was in difficulties.

The II. Bulgarian Army had, after seizing Uskub and taking, losing and retaking Veles, moved out fan-wise against the mountains N.W. and W. of Vranja, Kachanik, Kalkandelen, and the Babuna pass, while its extreme left was on the defensive against Sarraill's Rahovo group, and its left centre column was moving down from Shtip on Krivolak and Kavadar, where also Sarraill was collecting a considerable force. In the existing conditions it was evidently more important, from Todorov's point of view, to bar the Vardar valley against Sarraill than to attempt to force the mountain barrier of the Kara Dag and the Shar Dag. He therefore placed his centre of gravity well to the S., leaving his N. flank covered by a mixed force drawn partly from the I., partly from the II. Army.

Against this force, Putnik assembled the remnants of 5 divisions E. of Prishtina, and with them assumed the offensive with all the violence of which his troops were still capable, on Nov. 9.

This began on the 9th, driving the Bulgarian group of General Ribarov back to Vranja in the one direction and towards Kumanovo in the other. By the 15th Ribarov's right was in extreme difficulties. But the arrival of part of the I. Bulgarian Army from Leskovats on the left rear of the attacking wedge rescued it. By now the general front of the Austrian and German pursuit had reached Uvats, the line of the Ibar, Yaver (Javor), Kurshumlye. Pressure on the rear was too close to allow of persistence in the southward break-through. The moral rally which had permitted that attempt was dying away on all the defended avenues, and Putnik made up his mind to escape through Albania with what could be saved of the army and the people. Between Nov. 20-25, the historic Kossovopolye witnessed another last effort of the Serbian people, then everything flowed away towards Ipek (Pech), Dyakovo and Prizreni.

At these points the pursuit ceased in the first week of December. It had practically become Bulgarian alone. Such German

¹ As above mentioned, Mackensen was given orders almost on the battlefield to send away the XXII. Res. Corps.

roops as remained in the theatre when Falkenhayn's orders had been carried out were sent down the Vardar, into the midst of the Bulgarian II. Army. The Austrians diverged into Montenegro, which was completely occupied, with some severe local fighting and much secret negotiation, by the third week in Jan. 1916. But the end of pursuit did not mean rest and reorganization for the poor remnant of the Serbian army. It was impossible to live at the halt; and a midwinter march through the Albanian mountains, brought those whom its rigours left alive to the coast of the Adriatic. Thence, after some delay, they were transferred to Corfu, where the Western Powers provided food, equipment, clothing and stores, so mitigating a disaster that they might have prevented. (C. F. A.)

SERVIA: see SERBIA.

SETON-KARR, SIR HENRY (1853-1914), British big-game hunter, was born in India Feb. 5 1853. Educated at Harrow and Corpus Christi College, Oxford, he was called to the bar in 1879, but developed a taste for travel and big-game hunting which carried him all over the world. He also interested himself in state colonization and was a member of the Royal Commission on Food Supplies in Time of War. He published *The Call to Arms* (1900-1) and *My Sporting Holidays* (1904). He represented S.W. Lancs. (St. Helens) in the House of Commons from 1885 to 1906 and was knighted in 1902. He lost his life when the "Empress of Ireland" sank in the river St. Lawrence May 29 1914.

SEX (see 24.745*).—The problem of the determination of sex has in recent years been greatly elucidated. Knowledge has come from several sources. Both breeding experiments and cytological observation have severally led, as will be seen, to concordant conclusions, proving that the sex of the offspring is generally decided by one or other of the germ-cells which unite in fertilization. But though in ordinary circumstances the mode of determination is now known, there are nevertheless indications that in special cases the normal course may be altered or at least disturbed by various influences, the operation of which is not understood. The reconciliation of this latter class of evidence with the former has not yet been satisfactorily effected.

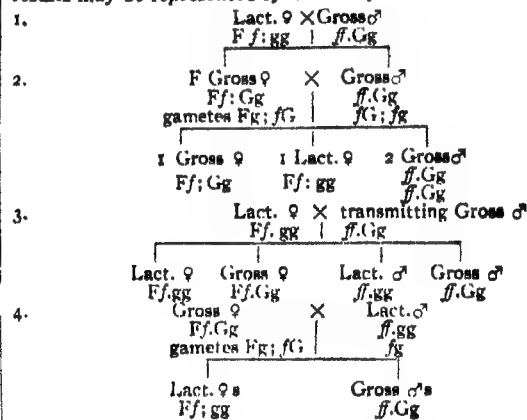

Sex Determined by Spermatozoa.—Knowledge of sex-determination began with the observation of Henking (1891) that in certain insects the spermatozoa were of two kinds, (1) those which contained a supernumerary, unpaired, or accessory chromosome (see CYTOLOGY), now generally called the X-chromosome, and (2) those without this body. McClung (1902) first suggested that this chromosome might be a determiner of sex, and took it to be the peculiarity of the male, but Miss Stevens (1905) and E. B. Wilson (1905), to whom the development of this part of the subject is chiefly due, proved that the spermatozoa bearing the X-chromosome are in these animals destined to form females. The eggs are alike in each possessing an X, and thus the somatic or diploid cells of the daughters come to have 2 X, one received from their mother and one from their father, whereas the diploid cells of the sons have one only, received from their mother. Since the gametes of the male are of two kinds, that sex is said to be *hetero-gametic*, the female being *homo-gametic*. Further observation, however, showed that the organization of even nearly allied genera of insects is by no means uniform in respect of the sex-chromosomes. Though unpaired in the males of some genera, the X may in others have a pair or "mate" of smaller size, known as the Y-chromosome. Between these and other genera in which the male has a pair of sex-chromosomes not visibly different from each other there are several transitional conditions. In a considerable number of forms also, the X is represented by a group of separate chromosomes, regarded as collectively the mates of the Y.

The X-chromosome has been seen in several orders of insects, especially Hemiptera, Orthoptera and Coleoptera, in spiders, myriapods and some nematodes. In man it is said (Guyer) to be represented by a pair corresponding to a single Y-chromosome.

Sex Determined by Ova.—Naturally this discovery that the male is hetero-gametic was at first supposed to be of universal application, but the next advance, which resulted from experimental breeding, showed that this simple view could not be enter-

tained. The Currant Moth (*Abraxas grossulariata*) has a variety *lacticolor*, characterized by a deficiency of black pigment, till then known only in the female. Doncaster, instituting experiments with this variety, found that by breeding such females with normal males the F_1 family consisted of males and females, all normal.¹ Interbred, these gave F_2 composed of two normal males: one normal female: one *lacticolor* female. But *lacticolor* ♀ × F_1 ♂ produced families containing normal ♂, normal ♀, *lacticolor* ♂ and *lacticolor* ♀, all in equal numbers. On breeding any normal *grossulariata* ♀ with the *lacticolor* ♂ now produced, the sons were all *grossulariata* and the daughters all *lacticolor*.

Other interpretations have been proposed, but it is evident that the eggs of the *grossulariata* ♀ are of two kinds, (1) those which are destined to be females, and do not carry the *grossulariata* factor, (2) those which do carry this factor, and are destined to be males (Bateson and Punnett). Taking the factors G, *grossulariata*; g, its absence; F, femaleness; f, its absence, the results may be represented symbolically thus:—

Sex-Limitation and Sex-Linkage.—Such a system of heredity is sometimes called "sex-limited," and the descent of the character so limited serves as an indication of the mode by which the factor determining sex is transmitted from parent to offspring. The proof that in these moths sex is determined by the eggs, or in other words that the female is the hetero-gametic sex, is thus complete. The same has been shown to be true of birds. In fowls, several conditions have been shown to be sex-limited to females; e.g. *black* as against the *cuckoo-markings* of the Plymouth Rock; *golden* (as in Sebrights or Hamburgs) as against *silver*; the *black pigment* of Silky fowls is suppressed by a sex-limited factor which inhibits this development, etc. In canaries the peculiar form of albinism known as *Cinnamon*, and in doves the pale albinotic variety shows a similar behaviour. We have thus to recognize that, paradoxical as it may appear, sex is in some animals determined by the sperm, and in others by the eggs. Man belongs to the former class. Apart from the cytological evidence, as yet unconfirmed, the descent of sex-limited conditions, notably colour-blindness, demonstrates this. Substituting male for female, colour-blindness, is transmitted in man exactly as the *lacticolor* character is in the moths. A colour-blind man mated with a normal woman has sons and daughters with normal colour-vision. The sons cannot transmit the colour-blindness, but the daughters transmit it to half their sons who are therefore colour-blind. Moreover, when the transmitting female is mated with the colour-blind man, the *colour-blind female* is produced, just as in the corresponding mating (3) in the *grossulariata* experiment, the *lacticolor* male was formed. Finally when the colour-blind woman mates with a normal man the sons are all colour-blind and the daughters are all transmitters. Following Doncaster's notation in the *grossulariata* scheme, if M, maleness, be substituted for F, and N, normal colour-vision, for G, the same analysis represents the observed facts: the transmit-

¹ In genetics the following symbols are frequently used: ♀ = female; ♂ = male; × = mated with; F_1 , F_2 , etc. = the first filial family, the second, etc.

ting female (Nmmm) in man, for example, corresponds with the male Ggff, etc.—in *grossulariata*.

There is thus no doubt that just as in the bird and the moth the female produces two kinds of eggs destined respectively to form females and males, so in man the male produces two kinds of sperms destined to form respectively males and females.

Cytological Interpretation.—The notation given above provides the simplest representation of the empirically observed facts without any attempt to refer them to cytological phenomena. This attractive branch of Genetics has been actively developed by T. H. Morgan and his colleagues with remarkable success; and though serious difficulties remain, the incidence of the sex-limited characteristics can so readily be interpreted as depending on the distribution of sex-chromosomes, observed or hypothetical, that a causative influence has with great plausibility been attributed to them. Starting from the now familiar fact that in certain animals the XY male has visibly one X-chromosome and the XX female two, it is argued that the "double dose" of X is the cause of the female characteristics and that one dose of the same element produces the male attributes. If, then, in such animals the dominant factors, which show linkage, be supposed to be also carried in the X-chromosome, the sex-limited distribution of the negative characteristics to males will result. At first sight the fact that in other animals the female is hetero-gametic seems irreconcilable with this scheme, but, by making the assumption that in these females a similar cytological apparatus exists, the genetic observations may be represented on the same plan as that adopted for the hetero-gametic males. For the hetero-gametic female may be represented as XY and the male as XX, and here again if the X carries the positive element, say the G of *grossulariata*, then the gamete of the composition XG is always destined to the sons, and Yg to the daughters, as the facts require. Perhaps the strongest evidence in favour of the chromosome hypothesis has been found in the phenomenon of "non-disjunction" in *Drosophila*, the fruit-fly, whose genetical composition has been studied more fully than that of any other organism (see GENETICS). In this creature sex-limitation is to males, and the male is hetero-gametic; but, exceptionally, unexpected forms appear, as, for instance, red-eyed males in the mating where white-eyed alone should normally be produced. Bridges found that in such individuals and among the families containing these abnormal members, irregularities in the occurrence of the chromosomes could be demonstrated. Apparently in some maturation division two X-chromosomes had passed to the same egg, others receiving none. From this a series of exceptionally constituted gametes are derived which could have brought about the observed exceptions. Another line of argument pointing to the same conclusion has been derived by Morgan and his associates from a study of gynandromorphs—the curious individuals composed of more or less irregular patchwork of male and female tissues, which are formed with some frequency especially among the various orders of insects. A number of these have occurred in the pedigreed families of *Drosophila*, and on analysis it was found possible in almost every case to refer the characters shown in the several parts to their parental origin.

A primary objection to these modes of interpretation is that the cytological conclusions rest on a still slender basis of observation. As regards the forms with hetero-gametic females an unpaired chromosome has been reported to exist in the females of two moths (*Phragmatobia* and a *Psychid*), but on the other hand, Guyer states that in certain birds the male has an unpaired chromosome. Commonly, moreover, no consistent cytological distinction between the two sexes can be observed. But a still more fundamental difficulty besets the conception of the characteristics of either sex as dependent on a merely quantitative distinction. From arguments which cannot be here developed the Y-chromosome is regarded as demonstrably empty, and containing no determining elements, and XY is therefore to be understood as in potentiality merely the half of XX. Chemical phenomena, vaguely analogous, have been appealed to as making this system of interpretation less inadmissible than it at first appears, but that it is beset by grave objections cannot be denied.

Cytology has been of great assistance in codifying the apparently contradictory records as to the intricate series of parthenogenetic or agamic and sexual forms of the Hymenoptera and Hemiptera. We have learnt for example that in Hemiptera (Morgan; von Bachr) when fertilization produces females only, the fact is due to the death of all the sperms, which do not bear the X-chromosome. But in these groups it not rarely happens (*Neuroterus*, Doncaster) that the fertilized females give rise parthenogenetically to other females of which, without fertilization, some produce females only and others males only, but no cytological distinction between these two types of females has been seen. Whatever be the true cytological account of sex-determination, we have nevertheless to recognize that femaleness and maleness respectively, though similar throughout the Metazoa both in outward manifestations and in deeper physiological features, are constructed upon at least two distinct genetic plans. To reconcile the infrequency of visible cytological distinctions between the sexes with the chromosome hypothesis it has been suggested that the critical bodies are in such cases attached to other chromosomes, but this, though undeniable as a possibility, is as an argument dangerously tinged with obscurantism, a comment which applies to many of the subordinate hypotheses supporting the chromosome theory of genetic causation.

The situation is one through which many scientific problems have passed before final solution has been obtained. By independent lines of evidence conclusions largely identical have been reached. The facts are not in dispute, but a consistent interpretation of the whole series has not at present been obtained.

Disturbance of Normal Sex-Ratios: the Production of Inter-Sexes.—Hybridization is not rarely followed by a disturbance of the normal sex-ratio. From canary females crossed with other finches and from domestic hens crossed with cock-pheasants male mules (sterile) are easily bred but female mules seldom if ever. Among Bovidae some crosses give fertile females but sterile males (S. v. Nathusius) and the same occurs in a cross between species of canines (Dettlarsen). Among Lepidoptera a series of such examples are known, the first having been observed by Standfuss, who called attention to the absence or scarcity of females in many species-crosses. Recently Goldschmidt, working with races or species of *Lymantria dispar* brought together from many countries, carried out a remarkable series of experiments. He found that a Japanese race used as ♀ × European ♂ gave normal males and females, but that in the reciprocal cross though the males came normal, the females were intersexes, exhibiting many transitional stages, approaching males in various degrees both in form, colour and instincts. When Japanese males of certain races were used, the whole of the female offspring are said to have been thus transformed into males. Goldschmidt states that the various races can be arranged in an ascending scale according to the completeness with which these effects are produced, but the phenomena showed many complications not as yet adequately represented, notably the appearance of partially transformed male intersexes in the F₂ generation raised by inter-breeding the normal offspring raised in the first experiment. It has been pointed out by J. B. S. Haldane (1920, unpublished) that, apart from certain exceptions, a general principle can be perceived in this group of phenomena. If in hybrid offspring either sex is consistently missing or defective, this will be the hetero-gametic sex, e.g. in birds and Lepidoptera the female, in mammals, the male.

Sex of Twins.—The facts hitherto dealt with all go to prove that sex is determined by the gametic contribution made by one or other of the parents and that this is the normal course is not open to question. In harmony with that conception of sex-determination, it is found that when, as in twinning of embryos and generally when the fertilized egg multiplies by division, the products are commonly all of the same sex. In the armadillo (*Tatusia novem-cincta*), studied in detail by Newman, four embryos, demonstrably arising by division of one blastodermic vesicle (developing ovum), are usually produced at a birth and are always of the same sex, the four being all males or all females. Patterson found an exception in the case of the parasitic

Hymenopteron *Paracopidosomopsis*, which by polyembryonic division sometimes produces both males, females and intermediates. That something analogous to non-disjunction here occurs is an acceptable interpretation of this anomalous instance. But there is a remarkable group of incontrovertible facts which show that sometimes the normal course of sex-development may be disturbed. F. Lillie discovered a remarkable example. When in horned cattle twins of opposite sexes occur, the female is sometimes sterile, being called a free-martin. It might be thought that these twins arose by division of one fertilized ovum, but Lillie by study of material from the Chicago stock-yards proved that an ovum had dehisced from each ovary and that therefore the twins were originally distinct. He further showed that sometimes the twins had an actual anastomosis between their foetal circulations. The presence of a male embryo must therefore be regarded as having the power of inhibiting the development of the female embryo, poisoning it in so far as the formation of the reproductive organs is concerned.

Effects of External Conditions.—Disturbance of the normal sex-ratios as a consequence of various interferences, such as starvation, high or low temperature, etc., has several times been alleged to occur, especially in Amphibia, and the evidence of R. Hertwig that delay in fertilizing the eggs of the frogs causes the production of a preponderance of males has been fully confirmed. Circumstantial details preclude the obvious suggestion that this is a result of differential mortality. Hertwig thought that inasmuch as the polar bodies are excluded very late, after the eggs are laid, his result might perhaps be reconciled with the conception of cytological pre-determination if the conditions of the experiment could in some way have decided which elements should be retained in the egg and which ejected in the polar body. Recently Seiler has made an observation of this kind in regard to a Psychid moth, *Talaeporia*. He states that if the females are kept in a high temperature while the eggs are undergoing maturation, it can be seen on cytological examination that the accessory chromosome more frequently remains in the egg, and that as a matter of observation more males are produced, the converse occurring under cold conditions. Until we know definitely which sex in Amphibia is hetero-gametic the discussion can scarcely be carried further, but the frequency with which transitional forms are found in the Ichthyopsida raises a probability that the facts are of a higher order of complexity. As to the genetical composition of the Amphibian intersexes, an important observation has lately been made by Crew. From the eggs of a female fertilized by a male showing intersexual characters 774 tadpoles were reared, all females. According to Baltzer, sex in *Bonellia* is directly determined by the conditions of larval life. The female is of course an animal of considerable size, whereas the male is a minute creature parasitic on her. Larvae which find the proboscis of the female and attach themselves to it are said to develop into males, those which remain free-swimming becoming females. Larvae artificially detached from the proboscis become intersexes. Adequate controls, by which the hypothesis of predisposition may be excluded, would in such an instance be most difficult to institute.

Effects of Castration.—Collateral evidence bearing on the nature of the distinction between the sexes has been drawn from many sources, especially from the results of castration, but though the facts thus empirically observed are of much physiological interest, they have no very direct bearing on the primary problem. The reproductive glands, acting chiefly, if not entirely, by virtue of the secretions (hormones) of their interstitial components, have often a great influence on the development and maintenance of secondary sexual characters, but the part played by the hormones must obviously be of a secondary nature. Removal of the genital glands has diverse effects in various animals. In good agreement with the discovery that in the bird the female is the hetero-gametic sex, it is found that both in the fowl and the duck (Goodale) the removal of the ovary induces the plumage and some other characteristics of the male. The female is thus an organism in which the male attributes are concealed or recessive, whereas a capon does not develop hen-feathering.

Moreover, Morgan found that in the Sebright bantam, the males of which are "hen" in plumage (not in combs or wattles), after castration the cocks acquire ordinary male plumage, which may naturally be interpreted to mean that the hen-feathering of these cocks is due to their possession of part of the female complex which has been transferred to them. Morgan and Punnett also have shown that the hen" character behaves as dominant in breeding, a fact which proves that the dominance proper to the whole female complex of the bird pertains also to that part of the complex which controls the plumage.

Castration performed on moths during the larval stage has not produced modification of secondary sexual characters (Oudemans). In crabs, however, the destruction of the testes by certain parasites produces very striking "feminization" of the abdomen and appendages (Geoffrey Smith), but we do not know which sex in Crustacea is hetero-gametic. We are without a satisfactory interpretation of this group of observations, some of which superficially considered seem to run counter to the facts of gametic determination already established, but the disturbances of the normal course may commonly, though perhaps not always, be conceived of as due to interruption of the chain of events by which the full effects of gametic predetermination are developed.

Hermaphrodites.—Attention should be called to a remarkable lacuna in our knowledge of sex-determination. Up to the present nothing has been yet discovered either by cytological or analytical methods as to the genetical relation of the hermaphrodite types among animals to those in which the sexes are distinct. In plants a little progress has, as will appear, been made, pointing to the conclusion that the hermaphrodite is dominant, containing something which the females at least do not, but as to hermaphrodite animals nothing can be said with confidence. This is much to be regretted, as the whole subject might be greatly advanced by such knowledge.

General considerations.—From the observation that the two sexes are formed by modification of a common structural plan, and from the fact that by interferences, of which some have been mentioned, individuals cytologically, or at least gametically, destined to be of one sex may be made to assume more or less of the characteristics of the other, the conclusion has often been announced that each sex contains the other latent in it. To this expression, in the light of modern knowledge, no precise meaning can be attached, and it probably conveys nothing of essential truth. The primary sexual distinctions evidently depend on factorial elements which follow more or less closely the familiar principles of Mendelian segregation. The determining factor for sex should probably be regarded as a complex, usually transmitted in its entirety, but capable by accidental errors of cell-division of being disintegrated, so that the elements responsible for special characteristics may become detached from the rest and may even be passed over to the sex which normally does not receive them. For example, the races of fowls which do not incubate have presumably thus lost a portion of the dominant sex-complex; the hen-like cocks of the Sebright bantam may be represented as having acquired that ingredient of the female sex-factor which in the normal female inhibits the formation of the sickle-feathers and hackles of the cock, and so on. A similar representation may be applied to those cases (e.g. Phalaropes) in which the cocks are hen-like and normally incubate the eggs. It is not unreasonable to suppose that the transference of an actual fragment of critical material, presumably a portion of a chromosome, is responsible for the physiological abnormality. The literature of obstetrics and of stock-breeding abounds with nostrums for the arbitrary regulation of sex in man and the domestic animals, but from what is accurately known of the mechanism of sex-determination, nothing favourable to these claims can yet be adduced. Nor can any explanation be offered of the fairly constant departures from equality which normally occur in man and various domesticated animals. In the pig, ox and rabbit the male births are said sensibly to exceed the female, but in the horse and sheep there is a small excess of female births. The races of man show definite differences in the proportions of the sexes at birth. Of living births, taking females at 1,000, the males for England and Wales

were for some time slightly below 1,040, which, though about the same as the proportion in Japan, is somewhat low in comparison with Germany, several European countries, and the white population of the United States, in which the males are about 1,060. On the other hand for the coloured population of the United States the male births are still less in proportion (in the year 1800, 1,024) and occasionally fall actually below the female number (998 in 1900). In all countries for which data can be obtained the proportion of males among still-births is very largely in excess of the females. Such divergences usually point to differential mortality or to the action of lethal factors, but in view of the large excess of males among still-births this account is not readily applicable here. The excess of males (surviving infancy) is exceptionally large in certain, though not all, of the families affected with the tendency to bleed profusely from trifling injuries, known as haemophilia. This is one of the sex-linked abnormalities appearing in males which follow much the same system of descent as colour-blindness. Illegitimate births in most countries show a distinct diminution in the excess of males.

Since the publication of Düsing, the proposition which he (following earlier writers) developed, that war produces an increase in the proportion of male births, has been widely disseminated. S. Newcomb investigated data as to births in the United States during the Civil War but found no positive result, and other parts of the evidence have been declared to be fallacious. Nevertheless, statistics for Great Britain and also those for Germany during the World War show a progressive rise which can scarcely be deemed insignificant. It should be remarked, however, that this rise had begun in Prussia some years before the war. On the other hand, no similar change has taken place in the neutral countries. For an adequate consideration of the facts many concomitant phenomena must be taken into account; for example, the fact that the total birth-rate of Prussia fell in the war period to less than half. Whatever be the immediate cause of the rise in male births, it is likely that it should be referred to the incidence of a differential pre-natal mortality rather than to any more fundamental genetic process.

Sex in Plants.—The attempt to make a factorial analysis of sex in the higher plants has not led to clear conclusions. Dioecious plants suitable for experiment are few. Correns, from results obtained in reciprocal crosses made between *Bryonia dioica* and the monoecious *B. alba*, inferred that the male of *dioica* was heterogametic, but the argument did not amount to proof. Shull's experiments with *Lychnis dioica* and a variation having the elements of both sexes present together were also beset with many complications and obscurities. In dioecious mosses the Marchals proved that segregation, in respect of sex, normally occurs at spore-formation, but both their experiments and those of Collins gave indications of further complexities. *Sphaerocarpos*, a liverwort, produces spores in tetrads, and of the four, two became males and two females. C. E. Allen states that the female spores each receive an accessory chromosome larger than that which passes to the male spores. Blakeslee showed that *Mucors* consist of several strains which may be called + and —, and that conjugation only takes place when a + culture comes into contact with a — culture. These strains may with great probability be regarded as two sexes, but the results were complicated by the discovery of other strains which are indifferent. We meet here the same difficulty noted in the case of animals, that the factorial relations between hermaphrodite plants and the dioecious forms have not yet been successfully represented. Varieties having the stamens to a greater or less degree aborted are not uncommon among the species of flowering plants which are normally hermaphrodite. If the deficiency is extreme, the variety is not merely in function female, but it is in a condition morphologically not distinguishable from the females of plants dioecious in the strict sense such as *Lychnis dioica* or *vespertina*. When such female varieties are fertilized with pollen from the hermaphrodite type the resulting family may be a mixture of hermaphrodites and females, but not rarely females only are produced. As the hermaphrodite is a dominant this evidence demonstrates that the hermaphrodite factor must thus be relegated to the female side,

the male side taking the recessive in which the anthers are aborted. Such "unilateral" distribution of the factors may exist in regard to colour, double flowers and probably many other factorial distinctions, and the conception of sex-linkage is in a special and limited sense applicable to them (C. Pellew). Otherwise nothing comparable with the sex-linkage of animals has yet been discovered in plants. It must always be remembered that, on account of the complications created by the existence of a syncopated alternation of generations in the higher plants, no direct parallel between sex, as manifested in them, and that of animals can be instituted.

SGAMBATI, GIOVANNI (1843-1914), Italian composer (see 24.757), died at Rome Dec. 15 1914.

SHACKLETON, SIR ERNEST HENRY (1874-1922), British polar explorer, was born at Kilkee Feb. 15 1874. He was educated at Dulwich College, and afterwards entered the merchant service, subsequently becoming a lieutenant in the R.N.R. In 1901 he joined the Antarctic expedition of Capt. Scott in the "Discovery," but had to return home on account of ill health. In 1908 he organized his first Antarctic expedition, largely fitted out by himself, which started from New Zealand in the "Nimrod," and achieved important results, reaching a point on the Antarctic continent about 97 m. from the South Pole (see 21.968). For this he was knighted in 1909, also receiving the C.V.O., while the Government contributed £20,000 towards the expenses of the expedition. He equipped a second expedition which left England in the "Endurance," Aug. 1 1914, with the idea of approaching the Antarctic continent from Weddell Sea and ultimately joining hands with another party whose ship, the "Aurora," was to start from Australia and approach by way of Ross Sea. Owing largely to bad ice conditions, the expedition was almost uniformly unfortunate (see ANTARCTIC REGIONS). The story of this expedition was related by Sir Ernest Shackleton in *South* (1919). He received the King's

star medal and many honours from learned societies. In addition to the work mentioned above, he published *The Heart of the Antarctic* (1909). In 1921, in the "Quest," he organized third expedition, which set sail in September; but while it was still on its way he died from an attack of *angina pectoris*, on board, off Georgia I., Jan. 5 1922.

SHANGHAI, China (see 24.799).—During 1911–21 the population and trade of Shanghai expanded steadily, as the result of the development of the port's railway communications with the interior and of the increasing development of cotton-spinning, shipbuilding and other industrial enterprises. At the same time the wealth and importance of the foreign settlements rapidly increased, chiefly because of the large number of Chinese officials, capitalists and political refugees who sought there security from the civil strife and disorders prevalent throughout the interior after the revolution.

The city's rate of expansion is reflected in the maritime customs returns, which show that the gross value of the trade of the port in 1919 amounted to 768 million taels, which, at an average exchange of 5s. 8d., represents £217,000,000. In 1908 the sterling value of the trade was £40,400,000. The changed conditions of international commerce brought about by the World War were manifested in the fact that in 1919, for the first time, the United States took the first place in the list of Shanghai's foreign trade, with a margin of 28 million taels over that of Japan, thus reversing the position occupied by the two countries in 1918. The trade of Great Britain, which before the war headed the list, showed signs of recovering some of its lost ground, especially in the matter of Manchester cotton goods.

The total pop. of Shanghai, as estimated by the Imperial Maritime Customs, was 1,000,000 in 1916, an estimate which included the inhabitants of the native city as well as those of the international and French settlements; but the actual total to-day must be considerably higher, for the Chinese pop. of the international settlement alone was 620,401 in 1915, and was estimated at 673,000 in June 1919. No reliable statistics are forthcoming in regard to the population of the native city (which displays but little evidence of the reformers' activities) nor of that of the Chinese-controlled suburbs of the foreign settlements, but it may be assumed to be increasing, while that of the French municipality has grown very rapidly since its boundaries were enlarged and its area developed by a progressive scheme of road construction. The foreign pop. of the international settlement in 1919 was calculated to be 22,000; at the last census (Oct. 1913) the total was 18,519, of which number 7,169 were Japanese, 4,822 British, 1,323 Portuguese, 1,307 Americans and 1,155 Germans. After the conclusion of the Russo-Japanese War, the number of Japanese residents increased much more rapidly than that of any other nation, but as the franchise for the election of the Land-renters' Executive Council is limited by property-owning or tax-paying qualifications, the British community still retains its predominant influence in municipal affairs. The Land-renters' list at the beginning of 1920 showed 1,100 British voters, as against 300 Japanese, 230 Americans and 150 Germans. The steady expansion of the revenues collected by the self-governing Council of the International Settlement (in which the Chinese Government has no jurisdiction) affords evidence of the growth and prosperity of the city during the past decade. In 1911 the rates and taxes collected were 2,589,628 taels; in 1919 the total was 4,419,961. The street traffic returns are significant not only of rapid growth but of changing conditions. In 1911 the council licensed 11,111 jinrikishas, 1,277 carriages, 217 motor-cars, 5,310 wheelbarrows, 199 sedan-chairs and 958 carts; the corresponding figures for 1919 were 14,726 jinrikishas, 831 carriages, 1,378 motor-cars, 8,667 wheelbarrows, 18 sedan-chairs and 2,141 carts. Industrial enterprise during this period was greatly stimulated by the improved facilities for the transport of raw materials provided by railway construction in the interior; cotton-mills, in particular, increased rapidly, the number of these at Shanghai at the close of 1920 being 26, with a total of 901,898 spindles. Factories were also established for the making of flour, cigarettes, matches, etc., and, as in Japan, a new development of the retail trade was manifested by the establishment of large department stores, conducted on European and American lines.

The political importance of Shanghai, as the headquarters of Young China and a sanctuary for political refugees of all descriptions, naturally increased during and after the upheaval of the Chinese Revolution. Many wealthy and conservative officials of the old régime sought and found security for themselves and their property within the limits of the extra-territorialized Foreign Settlements; later, in 1913, the expulsion of the Kuo-Mintang politicians from Peking by President Yuan led many of these southern Parliamentarians to make Shanghai their headquarters, and each succeeding year of civil strife added to the numbers of those who sought shelter from its widespread dis-

orders under the shelter of the municipality. Nor were the political refugees all Chinese, for, after the revolt of the Koreans against the Japanese Government in 1919, "the Provisional Government of the Korean Republic" established itself at Shanghai. Thus the little spot originally set apart as a place of residence for foreign traders came by force of circumstances to be the birthplace and centre of political activities in China, the vernacular press at Shanghai (including several of the most influential newspapers in the country) being generally in opposition to the policy of Peking and in sympathy with the views of the student class. By common consent of the contending factions, the Peace Conference convened in 1919 to discuss the differences between the Peking Government and the southern "Constitutionalists" was held in the neutral territory of the international settlement. An interesting feature of Young China's political activities in 1919–20 of particular importance to the future of Shanghai lay in its increasing insistence, on the one hand, on the abolition of the foreigners' extra-territorial rights and, on the other, on the recognition of the Chinese taxpayers' claim to a share in the direct executive government of the settlement, a claim which (while morally undeniable) would, if successful, effectively put an end to the conditions by virtue of which the Foreign settlements have afforded security for life and property during periods of widespread disorder in China.

See George Lanning and Samuel Couling, *The History of Shanghai* (1920).

SHANNON, CHARLES HAZELWOOD (1865–), English painter (see 24.801), was elected A.R.A. in 1911, and in 1918 became vice-president of the International Society of Sculptors, Painters and Gravers. His more recent works include "The Amethyst Necklace" (1907), "The Morning Toilet" (1912), "The Embroidered Shawl" (1914), and "The Incoming Tide" (1918); while in 1918 he produced various portraits, including those of Princess Patricia of Connaught, Miss Lillah McCarthy, and Miss Hilda Moore ("The Lady in Black"). Among his lithographs may be mentioned "Playmates" (1908), "Ebb Tide" (1917), "The Tidal River," and "A Sharp Corner" (1919). In 1920 he was elected R.A.

SHAUGHNESSY, THOMAS GEORGE SHAUGHNESSY, 1st BARON (1853–), Canadian railway president, was born at Milwaukee Oct. 6 1853, his parents being Irish. He was educated at St. Gall's academy, Wisconsin, and began his railway service at the age of sixteen. In 1882 he joined the staff of the Canadian Pacific as general purchasing agent, and by 1891 had risen to be its vice-president. From 1899 to 1918 he was president and chairman of the board of directors, as well as a director of all the allied lines. He was knighted in 1901, created K.C.V.O. in 1907, and raised to the peerage of the United Kingdom as Baron Shaughnessy of Montreal and of Ashford, co. Limerick, in 1916. His two sons, William James Shaughnessy (b. 1883) and Alfred Thomas Shaughnessy (b. 1887) served in the Canadian Expeditionary Force during the World War, and the younger was killed in action in 1916.

SHAW, ANNA HOWARD (1847–1919), American reformer, was born at Newcastle-upon-Tyne, England, Feb. 14 1847. When she was a small child her parents moved to Massachusetts, and soon afterwards to Michigan, where her father cleared a farm, 40 m. from the nearest post-office and 100 m. from the railway. From 1872 to 1875 she studied at Albion College, Mich., and in 1878 graduated from the Theological School of Boston University. The district conference of the Methodist Episcopal Church granted her a local preacher's licence, and she held pastorates at Hingham and East Dennis, Mass., remaining in the latter place seven years, until 1885. Meanwhile the New England Conference of the M.E. Church refused to ordain her because of her sex, and the refusal was upheld by the General Conference at Cincinnati in 1880. But the same year she was ordained in the Methodist Protestant Church. While preaching she had studied medicine and received the degree of M.D. from Boston University in 1885. She was then chosen lecturer for the Massachusetts Woman's Suffrage Association. The following year she was made national superintendent of franchise of the Women's

Christian Temperance Union, serving for six years. She was also associated after 1886 with the National American Woman's Suffrage Association as lecturer, vice-president-at-large, and from 1904-15 as president, when she declined reelection. She had spoken in every state, before many state Legislatures, and before Congressional committees. She was a member of the International Council of Women; the International Suffrage Alliance; the National Society for Broader Education and the League to Enforce Peace. In 1917 she was appointed chairman of the woman's committee of the Council of National Defense, and in 1918 edited for this committee a department in the *Ladies' Home Journal*. She died at Moylan, Pa., July 2 1919, shortly after the passage of the suffrage amendment to the Federal Constitution by Congress. Her last message was an appeal to women to use their influence for the ratification of the League of Nations. She was the author of *The Story of a Pioneer* (1915, with Elizabeth Jordan) and joint editor of *The Yellow Ribbon Speaker* (1901, with Alice Stone Blackwell and Lucy Elmira Anthony).

SHAW, GEORGE BERNARD (1856-), British dramatist (see 24.812), produced on the London stage subsequently to 1910 *Fanny's First Play* (1911), *Overruled* (1912), *Androcles and the Lion* and *Great Catherine* (1913) and *Pygmalion and The Music Cure* (1914). He also produced in Dublin, or at special performances in London, the one-act plays *O'Flaherty*, *V.C.* and *Augustus does his Bit* (both satires on problems of the World War), *The Inca of Jerusalem* and *Annajanska*, and published a three-act play *Heartbreak House* (1919), produced in New York, and also in a German version in Vienna in Nov. 1920. A few months after the outbreak of war he published, as a special supplement to *The New Statesman*, an outspoken deliverance on "Common Sense and the War," which occasioned much comment and earned him some unpopularity. In 1921 he published *Back to Methuselah*. (See ENGLISH LITERATURE.)

SHAW, JOHN BYAM (1872-1910), English painter, was born at Madras Nov. 13 1872, the son of John Shaw, registrar of the high court of Madras. He came to England in 1878, and his first art teaching was obtained at the St. John's Wood school of art. He entered the Royal Academy schools in 1880, and his picture "Rose Mary" was hung in 1893. One of his best-known works was "Love the Conqueror" (1899). He illustrated a great number of books, among them being Browning's *Poems* (1898); *Tales from Boccaccio* (1899); *Pilgrim's Progress* (1904); Edgar Allan Poe's *Tales* (1909), etc. In 1911 he established, with Rex Vicat Cole (b. 1870), a school of art at Kensington. He died in London Jan. 26 1910.

SHAW, RICHARD NORMAN (1831-1912), English architect (see 24.813), died at Hampstead Nov. 17 1912.

SHAW, SIR WILLIAM NAPIER (1854-), British meteorologist, was born at Birmingham, March 4 1854. He was educated at King Edward's school, Birmingham, Emmanuel College, Cambridge, of which he became a fellow in 1877, and the university of Berlin. From 1887-99 he was university lecturer in experimental physics at Cambridge, from 1898-9 assistant director of the Cavendish laboratory, and from 1890-9 senior tutor of Emmanuel College. In 1891 he was elected a fellow of the Royal Society. In 1897 he became a member of the Meteorological Council, and was from 1900 to 1905 its secretary, in the latter year being appointed director of the Meteorological Office. In 1907 he became reader in meteorology in the university of London. He was president of the mathematical and physical section of the British Association in 1908 and of the educational section in 1910, and in 1919 was president of the International Conference of Meteorologists held in Paris. He was knighted in 1915, and in 1920 retired from his position at the Meteorological Office. Sir Napier Shaw's works include *Life History of Surface Air Currents* (with R. G. K. Lempfert, 1906); *Air Currents and the Laws of Ventilation* (1907); *Forecasting Weather* (1911); *Manual of Meteorology* (1910); besides many papers in scientific journals and valuable reports of meteorological and other subjects. He received many honours and distinctions, including the Symons medal of the Royal Meteorological Society.

SHELL-SHOCK, the popular name given during the World War to an obscure form of nervous disease which became rife among the armies. The term "shell-shock" appears to have been officially adopted in Great Britain in 1916, although cases to which this term might have been equally applicable had occurred in the English and French armies from the beginning of the war and onwards. It is probable, although it is not recorded, that similar cases occurred in previous bloody wars; but never before have such vast numbers of men been subjected to such terrific strain, dangers and horrors from forces generated by explosives. In consequence thereof the term "shell-shock," applied to all forms of war psycho-neurosis, found ready acceptance by the press and public, but by neurologists it was generally regarded as a misnomer—unless it were strictly limited to cases of concussion or commotion of the brain directly caused by the violence of the forces generated by the explosion.

Early in the war, and subsequently, cases of sudden death of groups of men without visible external signs of injury were recorded. They were particularly noted when the explosive forces were generated in confined spaces, where percussion and repercussion would be intensified in their effects upon the cerebro-spinal fluid, which acts as a water-jacket to the central nervous system and especially protects the vital centres in the medulla from concussion. Carbon-monoxide poisoning was also considered a possible cause of such a death, and especially was this likely in the case of explosion of mines or the imperfect detonation of shells in closed spaces, such as dugouts, saps or ravines.

The great majority of cases diagnosed as "shell-shock" were not *commotional* in origin, but *emotional*, and due in most instances to the existence in the sufferer of an inborn timorous, neuropathic or psychopathic disposition; but in a certain number of cases an emotional instability was acquired by the prolonged strain and stress of war. Thus fatigue, insomnia, anxiety and infective disease frequently combined to cause a neuro-potentially sound individual, with an excellent record of service, to become emotive and to develop "shell-shock," the final breakdown having been precipitated by a shell bursting near to him. The present writer had the opportunity of examining post-mortem the brain in such a case, and it showed rupture of minute vessels and haemorrhages into the substance of the brain and cerebro-spinal fluid.

In the absence of objective signs during life, such as ruptured tympanum, and changes in the cerebro-spinal fluid—for example, the existence of blood—it would be impossible for the medical officers to decide whether such a case was primarily commotional or emotional. This is an important matter, for the former was classed as a battle casualty and entitled the sufferer to a gratuity. The large number of British cases claiming a gratuity for "shell-shock" led to the promulgation of Army Form W 3436, which required circumstantial evidence by an eye-witness of the proximity of the soldier to the bursting shell. Even then great difficulties were experienced in coming to a just decision, for a purely commotional case, if not severe, usually recovered more rapidly than an emotional one; consequently, a record of service and the severity, character and persistence of symptoms had to be taken into account.

The diagnosis of "shell-shock" was made at the Casualty Clearing and Field Ambulance stations, and when a barrage was opened prior to the attack of the enemy, or other intense shell-fire, medical officers at the front-line stations had little time to investigate the numbers of casualties coming in, and until the later period of the war cases of "shell-shock" were sent to the base hospitals. The wish in a great number of these cases was not to go back to an intolerable situation; and fear, associated with the instinct of self-preservation, arose as an unconscious defence mechanism, and persisted in maintaining such hysterical manifestations as amnesia, tremors, paralyses, contractures, convulsive tics, aphonia, mutism, blindness, deafness and other functional sensori-motor disabilities. Whereas hysterical manifestations were extremely common in the ranks, they were relatively rare among the officers, who suffered from neurasthenia and anxiety neurosis instead. These two forms of psycho-neurosis

in no essential manner differed from those affecting civilians of either sex (see 14.211 and 19.432).

Among the causes which led to the prevalence of cases diagnosed "shell-shock" was the neurological and psychological inexperience of medical officers in the diagnosis and treatment of psycho-neurosis. Another was the degree of discipline, *moral* and *esprit de corps* in a regiment; this largely depended upon the personality of the commanding officer, the medical officer and the quartermaster, their efficiency in performing their duties and their endeavours to supervise the welfare of their men so far as the emergencies of war permitted. Thus confidence and will-power were inspired in the men to face with them any situation, and "shell-shock" cases were relatively few in such regiments as compared with the number of cases in a regiment with poor *moral* and discipline, where suggestion played an important part.

It is generally accepted by medical authorities in England and abroad that the stress and strain of war, including exposure to shell-fire, does not produce psychoses such as epilepsy, manic depressive insanity, dementia-praecox, obsessional psychasthenia, or an organic disease like general paralysis, but it may excite or reveal them. It is, however, admitted that exhaustion or toxic psychoses with mental confusion of a temporary character are often due solely to the stress and strain of war.

Relation of "Shell-shock" to Court-Martial Procedure.—As a result of questions in Parliament and a debate opened on April 28 1920 by Lord Southborough, a War Office committee, with Lord Southborough as president, was constituted July 1920 with the following terms of reference:—

"To consider the different types of hysteria and traumatic neurosis called 'shell-shock'; to collate the expert knowledge of the service medical authorities and the medical profession from the experience of the war, with a view of recording for future use the ascertained facts as to its crisis, nature and remedial treatment and to advise whether, by military training or education, some scientific method of guarding against its occurrence can be devised."

In the House of Lords debate, in which Lord Horne, Viscount Peel and Lord Haldane took part, a good deal of attention was devoted to court-martial procedure, and especially in relation to "shell-shock" and to death sentences in connexion with cowardice and desertion. From what was said it seems probable that in the early days of the war, before "shell-shock" was fully understood, a few men were shot who, in the light of further knowledge and experience, could not have been held responsible for their actions. The question arises, When is a man who has pleaded "shell-shock" (taken in its widest acceptance) to be held responsible for and conscious of the quality of his acts? The psychology of the emotion of fear in relation to the instinct of self-preservation and the will-power to control supplies a basis upon which to answer this question. The emotion of fear is associated with three instinctive reactions, as we see in animals: (1) flight; (2) immobility; (3) concealment. In war practically every man, even the bravest, before a battle may experience fear; but a soldier should, by suitable training and confidence in his superior officers, overcome this by will-power, and thus convert the primary reaction of fear into that of anger. How can a medical officer differentiate between cowardice and fear causing an irresponsible lack of will-power in a man to control his actions in the face of difficulties and dangers? The doctor should know the man's personality, his previous record and what his comrades thought of him. It is not so much what he says as what he did, or what he has done, which will help towards a decision. There are, however, certain signs in a man who refuses to go forward in action or who runs away, that show he cannot be held altogether responsible for his action. He may be dazed in consequence of "shell-shock" and be the subject of mental confusion; there may be physical signs of fear over which he has no voluntary control, namely rapid action of the heart, dilatation of the pupils, sweating, blueness and coldness of the hands, often protrusion of the eyeballs, and an expression on the face which is hard to simulate. These conditions, associated with trembling, are sufficient indications of true fear inhibiting the will.

Out of the psychology of fear arises the question whether in recruiting there is any test by which the unfitness for active

service on account of a nervous disposition can be ascertained. And, if so, whether it would be desirable to eliminate from the army such a man without probation. It is a fact that many highly intelligent men with nervous instability may, if suitably trained, develop into most efficient officers and non-commissioned officers. Much depends upon the method of training and on those who undertake the training. A sensitive nature with self-esteem must not be broken by harshness or injustice, which produces a mental conflict ending in an anxiety-neurosis or neurasthenia. It is generally admitted that under no circumstances should an imbecile, an epileptic or an individual who has suffered with a previous attack of insanity be recruited.

For further information the reader is referred to *Parliamentary Debates, House of Lords*, Wed. April 28 1920, vol. xxxix., No. 29. See also Sir F. W. Mott, *Shell Shock and War Neurosis* (1919). (F. W. Mo.)

SHERMAN, JAMES SCHOOLCRAFT (1855-1912), American politician, was born near Utica, N.Y., Oct. 24 1855. He graduated from Hamilton College in 1878, was admitted to the bar in 1880, and practised in Utica until 1907. In early manhood he left the Democratic party, became a Republican, and as such was elected mayor of Utica in 1884. In 1886 he was elected to the National House of Representatives and was returned continuously until 1908, excepting the term 1891-3. He was a delegate to the National Republican Convention in 1892; chairman of the Republican State Convention in 1895, 1900, and 1908; and chairman of the Republican National Committee in 1906. For 12 years he was chairman of the House Committee on Indian Affairs—a subject naturally of great interest to him, as he was a relative of Henry R. Schoolcraft (see 24.359)—and the Sherman Institute in California, an Indian school, bears his name. At the Republican National Convention of 1908 he was nominated vice-president on the first ballot and was elected on the ticket with William Howard Taft. Four years later he was renominated, but he died at Utica, Oct. 30 1912, shortly before the elections.

SHEVKET, MAHMUD (1858-1913), Turkish pasha, was born at Bagdad in 1858, and from early youth showed marked qualities of intellect and personality. He received his military training at the military college in Constantinople, 1875-80, and after a very brief period of service with the troops was given an appointment on the general staff. Von der Goltz, who at that time was reorganizing the Turkish army, thought very highly of the young Shevket, and it was through his agency that the latter was sent to Germany to manage the reëquipping of the Turkish army. As a result he remained from 1884 to 1894 in the small arms factory of Mauser Bros., at Oberndorf on the Neckar. He also studied armament problems in France for a short time, and in 1894, as the reward of his labours, was made inspector of military arsenals in Constantinople. From 1901 to 1903 he was military governor of the Hejaz, in Arabia, then in what amounted to a state of war. He next went in a like capacity to Kossovo (Uakub), and there came in contact with the Young Turk movement, which had its headquarters in Salonika. In 1908 Abdul Hamid averted the break-up of the old régime by summoning a National Assembly. This state of things, however, did not last long. In the spring of 1909 the Old and Young Turks were struggling for supremacy. A powerful Old Turk counter-revolution was prepared, but, in mid-April, the III. Army Corps, under Hussein Husni Pasha, marched from Salonika against Constantinople. At San Stefano Mahmud Shevket took over the command, and, after heavy fighting, forced his way on April 4 into Constantinople. Impressed by his victory the National Assembly no longer dared to oppose the will of the Young Turks, and on April 26 voted the deposition of Abdul Hamid. Mahmud Shevket was the hero of the day. But he did not care for politics, which he considered had been the ruin of the Turkish corps of officers, and preferred to confine his activities to purely military matters. The next few years afforded him plenty of opportunities. In 1910 and 1911 he put down a revolt of the Malissors with great energy, and in 1912 fought against the rebels in Albania. In the summer of 1912 he became Minister of War, and in Jan. 1913 succeeded Kiamil as Grand Vizier. He took a very

active part in army reforms, but he came into conflict with the Union Libérale, which took its orders from Sherif Pasha in Paris, and he was murdered by one of its members on June 11 1913.

SHIP AND SHIPBUILDING (see 24.867).—The period from 1910-21 was marked by great progress in shipbuilding; that progress was in some ways interrupted, in others stimulated, by the World War, which overshadowed every phase of development both in commercial and naval enterprise. The naval strengths during ten years after 1921 of the chief nations were restricted as a result of the decisions summarized in the article **WASHINGTON CONFERENCE**.

The great object of the Allied belligerents during the war being to obtain the maximum output both of war material and of merchant ships on which their supplies depended, those responsible for the building of all types of ships naturally turned their attention to standardization. This had the effect of retarding the adoption of new inventions on the one hand; but on the other the novel circumstances and continued development of material by Germany during the war, and the ruthless use made of that war material, continually called for novel devices and new types of ships to meet and defeat the continually changing and ever-increasing intensity of the campaign. This, whilst it produced many new types of warships and countless devices for their improvement in offence and defence, in the case of many classes of warships, but more particularly in the design of merchant ships, had the effect of developing standardized types, both in Great Britain and later in America, in order to increase the numbers of ships for transport purposes of all kinds and so counter the enormous losses due to the German submarine campaign. After the Armistice, although at first there was an enormous demand for ships of all classes, the slump in trade in 1920-1 and the very high prices of ships had the effect of reducing the demand. In Great Britain many of the warships building after the Armistice were broken up and no new ships had in 1921 been started. The output of merchant ships was in 1921 steadily declining, so that it could not be said that shipbuilding had yet resumed that steady advance which was being made before the war.

The outstanding features which have affected the design of all classes of ships specially are the gradual adoption of oil in lieu of coal as a fuel, the further development of the steam turbine, and, for certain classes of vessels, the progress made with internal-combustion engines (see **INTERNAL COMBUSTION ENGINES**).

In the British navy, and to a great extent in other navies, during this period, oil most completely superseded coal for steam-raising. At first destroyers were the only type of vessel, apart from submarines, in which coal was altogether abolished as a fuel in the British navy. Then in 1912 light cruisers of the "Arethusa" class had oil only. A little later in that year, in the "Queen Elizabeth" class of battleships oil was decided upon as the only fuel for the first time in a capital ship. Subsequently to that, no British warship proper, with the exception of the "Raleigh" class of 10,000-ton light cruisers, which were destined for world-wide work, had anything but oil as a fuel, and in the "Raleighs" seven-eighths of the power was derived from oil. This change was a very momentous one to make, especially when it is considered that in Welsh coal Great Britain possessed the finest and then the cheapest steam coal in the world. In spite of this, however, the advantages of oil were so great that, when in use it had been found satisfactory, coal was relegated to be the fuel of none but special or auxiliary ships in the navy.

The advantages of oil may be summarized shortly as follows: For the same weight it has 50% more thermal value than coal. It occupies less space and can be stowed in spaces inconvenient for coal and other stores. Boilers with oil remain much cleaner for a long period, so that full power can be kept up indefinitely as long as the fuel lasts. Oil can be easily taken on board at any time, thus not calling upon the crew for the great exertion involved in coaling ship hurriedly, perhaps just before their energies are required for fighting an action. The exertion of stoking is entirely done away with and far fewer men are required in the stokehold, which is always clean and comfortable. With oil also much larger boilers can be used, which saves space in the boiler-

rooms. Though there are other contingent advantages, those named are enough to show that the British Admiralty took a wise course in adopting oil for all fighting ships, and this was amply proved during the war.

Subsequently, owing to the very high price of coal and of wages for firemen, many of the advantages enumerated above induced merchant shipowners to adopt oil in place of coal for high-powered passenger vessels. In low-speed cargo-boats the great economy of internal-combustion engines as compared with steam-engines, makes the advantage of the adoption of oil still more paramount, and the number of these vessels has been largely increased. The comparatively low powers, however, which can be got with internal-combustion engines prevented their being adopted up to 1921 for fast merchant ships or for any warships, except submarines, which generally have comparatively low power and moderate speed. In submarines a much lighter internal-combustion engine than that used for cargo vessels has been developed, with a high number of revolutions.

Another very important advance in marine engines has been gained by the use of toothed gearing. This gear enabling the high number of revolutions in turbines to be reduced, so that large slow-running propellers can be used in conjunction with very quick-running efficient turbines, a much higher efficiency has been secured and increased speed of ship and economy of working has resulted. In its present form this gearing was first introduced in 1910 by Sir Charles Parsons in connexion with the turbine engines of a merchant vessel named the "Vespasian." The success of the trials of this ship led to the further adoption of gearing, and for the British navy it was first tried in destroyers, then in some light cruisers, and was in 1921 gradually coming into use for most war ships and many mercantile ships. The largest ship in which it had been adopted was H.M.S. "Hood."

I. BRITISH WARSHIPS

Taking the first most important type of British warship, namely capital ships, the naval actions in the Russo-Japanese war of 1904-5 had demonstrated the capital importance of the heavy long-range gun, while the turbine system of propulsion had been sufficiently tested in high-speed passenger vessels and small warships to justify its adoption, at any rate experimentally, in warships of a larger size. These changes were, no doubt, bold ones, both as regards guns and machinery; but the wisdom of their selection for the design of the first "Dreadnought," in 1905, was sufficiently vindicated by subsequent experience, and by the general acceptance of these two features by other naval Powers.

Laid down in Oct. 1905, the original "Dreadnought" proved so successful that from 1907 onwards the designs of British capital ships moved on progressive lines without departing from the essential principle of the "Dreadnought" type, viz. a ship carrying an all-big-gun armament, adequately protected for taking her place in the line of battle, and of a speed at least equal to that of any foreign ship of similar rank.

The next 10 years therefore saw a succession of post-"Dreadnought" battleships in which the primary armament passed from the ten 12-in. guns of the "Dreadnought" through the ten 13.5-in. guns of the "Orion" (all on the centre line of the ship) to the eight 15-in. guns of the "Queen Elizabeth," an increase, within that brief period, of over 126% in the heavy projectile weight of discharge. There was no secondary battery, properly speaking. The "Dreadnought" carried 24 12-pdrs. for repelling T.B.D. attack, but this armament was soon recognized as being too light for the ever-increasing size and power of destroyers, and in subsequent ships up to the "King George V." class (inclusive) batteries of 12 to 16 4-in. guns were mounted as high up as possible to repel the attack of destroyers. In the "Iron Duke" and "Queen Elizabeth" classes 6-in. Q.F. guns were substituted for the 4-in., as the latter weapon was then thought to be insufficient against destroyers and light cruisers.

The speed of these battleships was kept at the uniform level of 21 knots up to and including the "Iron Duke" class. The type of turbine machinery on four shafts, which had proved so satisfactory in the original "Dreadnought," became the standard

but the growth in displacement necessitated a corresponding increase in power to attain the requisite speed. The use of oil fuel in association with coal was maintained until the "Queen Elizabeth" class was reached, when the greater advantages of oil fuel and the improved methods of its combustion finally caused the abandonment of coal as fuel. A noteworthy feature of these remarkable vessels was the advance in speed to 25 knots, necessitating, on a slightly larger displacement than that of their predecessors, an increase of about 150% in the power.

Concurrently with the development of the battleship proper, that of the British battle cruiser may be followed with advantage. Up to the inception of the "Dreadnought" design nothing more ambitious than an armament consisting of 9 2-in. guns associated with 7.5-in. guns ("Warrior" and "Minotaur," 1903-4) had been attempted in armoured cruisers. But the same reasons which caused the evolution of the all-big-gun battleships from the mixed armament of the "King Edward VII." and "Lord Nelson" classes now called for a similar simplification in the armoured cruiser designs. The outcome of this policy was the production of the "Invincible" class of "cruiser battleships," now generally known as "battle cruisers."

In these vessels the additional power necessary for their 4 to 5 knots superiority of speed over the "Dreadnought" was obtained at the sacrifice of two 12-in. guns and some loss of armour protection. The value of speed, which in battleships had always been a debatable point, was, of course, incontestable for the battle cruisers, and the development of the type has, both before and since the outbreak of the war, kept pace with the insistent demands of the strategist for the highest speed obtainable. Within the 10-year period referred to above, the increase in speed and power from the "Invincible" (25 knots for 41,000 H.P.) to the "Renown" (32 knots for 120,000 H.P.) required an increase in displacement from 17,250 tons to 26,500 tons, the relative increase in power being over 100 per cent. Finally in the "Hood" a speed of 32 knots with 144,000 H.P. on a displacement of 41,200 tons, an increase of 235% in power was involved.

The wisdom of the policy which initiated this new era in naval construction, relegating temporarily into the background the former British supremacy in capital ships, was naturally the subject of much criticism. But evolution in warship construction is not the property of any one navy, and there is little doubt that, at the conclusion of the Japanese war, the world stood on the threshold of a new era in naval architecture. If British naval supremacy was to be maintained it had to be done by leading the world along the new path of warship design, without waiting for others to utilize the advantages that had been rendered possible by progress in armour, guns and machinery. How great an advance the "Dreadnought" represented on previous ships may be gauged from the particulars given in Table I.

TABLE I.—Comparison between "Dreadnought" and the Best Previous Ships.

	"Dreadnought" (as designed)	Best Previous Ship
Number of 12-in. guns carried.	10	4
Length of line of battle for equal number of 12-in. guns on the broadside	Ratio	1 to 2
Total muzzle energy per broadside of 12-in. guns	383,000 ft.-tons	145,000 ft.-tons
Length of line of battle for equal 12-in. broadside gun power	Ratio	1 to 2.6
Tons displacement per 12-in. gun	1,785	3,750
First cost per 12-in. gun in line of battle	£175,000	£280,000
Annual upkeep of ship per 12-in. gun carried.	£34,800	£62,300
Speed (knots)	21	19
Endurance:		
At economical speed (nautical m.)	5,800	5,790
At 16 knots (nautical m.)	4,000	3,000

Other navies were not slow to follow the lead given by Great

¹ This includes pay, victualling, repairs, coal, stores, etc., together with an addition of 15% per annum of first cost, for interest and depreciation, etc.

Britain. The veil of secrecy in which the new types were closely shrouded whetted the emulation as well as the curiosity of other nations. Germany, ever ready to reap where others have sown, set about preparing for the change, and two years later produced the "Nassau" class, with 12 11-in. guns as main armament and 12 6-in. guns as anti-destroyer armament. At the rate of three a year she continued to lay down ships of this type—improved in armament as time progressed—each batch being accompanied by a battle cruiser of corresponding power and speed. Other nations fell into step, and, during the five or six years preceding the outbreak of war, produced, with variants appropriate to their several necessities, all-big-gun ships carrying a main armament of 10 or 12 primary weapons grouped in turrets shielding two, three, or even four guns each.

While the German output of capital ships had, once it got under way, continued with methodical regularity, British naval construction had suffered from the vagaries inseparable from divergent political views and aspirations.

Under the "Cawdor Memorandum" of Nov. 30 1905 it had been laid down that the minimum British requirements would be four large armoured ships a year, and the "Dreadnought" with the three "Invincibles" fulfilled this condition, but in each of the two following years only three battleships (and no battle cruisers) were laid down, while the 1908-9 programme only provided for one battleship ("Neptune") and one armoured cruiser ("Indefatigable"). Efforts had been made to induce Germany to curtail her naval expansion—"a year's holiday in naval construction" being suggested—but such hopes as were based on this contingency gradually faded before the inexorable German determination to challenge British sea supremacy. In the 1909-10 estimates provision was therefore made for laying down four capital ships, two in July 1909 ("Colossus" and "Hercules") and two in Nov. ("Orion" and "Lion"), while four "contingent" ships ("Monarch," "Thunderer," "Conqueror" and "Princess Royal") were to be laid down in April 1910, if the German menace showed no signs of abating. So far from this latter being the case, there was an acceleration in the dates of laying down the German ships, and the programme outlined above was therefore punctually carried out. The 1909-10 programme, it will be seen, was a memorable one in the history of British naval construction, and its adoption enabled Great Britain to maintain her naval supremacy, which otherwise would have been jeopardized.

Notwithstanding the atmosphere of uncertainty created by the delays due to hopes of a reduction of armaments, the rate of progress on warships under construction was well maintained, and, with a few exceptions, Great Britain was able to complete the largest battleships within 24 to 30 months of laying down, a performance which compared favourably with the best achievements abroad, and which not even Germany with her methodical preparations was able to equal.

The disposition of the heavy guns in both battleships and battle cruisers had, during the first five years of this period, undergone several important modifications. In the "Dreadnought," "Bellorophon" and "St. Vincent" classes the five two-gun turrets were placed as in the diagram:—A being on the forecastle deck, the remaining turrets on the upper deck, giving eight guns on each broadside, six ahead and six astern.

The "Invincibles," which carried one turret (X) less, had the two middle turrets P and Q disposed *en échelon*, and the superstructure amidships was so arranged as to enable all eight guns to fire on either broadside. The middle turrets were, however, placed so near to one another that serious trouble was experienced from gun blast when firing across the deck. In the battle cruisers of the "Indefatigable" class, and the battleships of the "Neptune" and "Colossus" classes, therefore, where a similar arrangement was adopted, the centre pair of turrets were spaced wider apart. A further change in the arrangement of turrets was adopted for the first time in these

battleships, where the after-pair were disposed at different deck levels to enable X turret to fire over Y. This arrangement, which now became the standard practice, while it introduced some difficulty in providing for stability, was economical of space, and simplified many of the gunnery problems connected with the ship; it gave, moreover, a higher gun platform for some of the armament.

While the offensive qualities of the battleships had continued to increase in successive types, the need for improved defence, particularly against mine and torpedo attack, had not been overlooked.

The adoption of protective bulkheads against under-water attack as carried out in the "Dreadnought" and subsequent capital ships was the outcome of the naval engagements of the Russo-Japanese war. The Russian battleship "Tsarevitch," in particular, had been fitted with a protective deck which, instead of being continued to the side of the ship, was turned down in wake of the magazines, forming a heavy longitudinal bulkhead situated some distance from the ship's side. This protection had enabled her to resist successfully the explosion of several torpedoes. It was decided to incorporate in the "Dreadnought" design some under-water protection to the vitals. Within the limits of displacement available it was not possible to do more than protect the magazines and shell-rooms. These were given 2-in. protective bulkhead plating at the three centre-line turrets, and 4-in. protective bulkhead plating outside the two beam turrets, as the latter, being situated nearer the sides of the vessel, were consequently much more vulnerable.

In the subsequent "Bellerophon" and "St. Vincent" classes this side protection was developed in the form of a continuous longitudinal protective bulkhead terminated by protective transverse bulkheads completely boxing in the magazines and shell-rooms of the five turrets and the main machinery spaces enclosed between them. The thickness varies from 1½ in. to 3 in. according to the distance of the bulkhead from the outer shell of the ship. In a vertical direction the bulkhead ran from the outer bottom to just above the lower edge of the side armour. In the "Hercules" and "Orion" classes there was a reversion to the original "Dreadnought" system of isolated protection to the various compartments immediately below each of the three groups of turrets, the remainder of the ship's hull below water-line being unprotected. In the "King George V." and "Iron Duke" classes the under-water protection was extended by joining up the portions between the two foremost turrets to those below the centre turret, so that only the ends of the ship and something less than the middle third remained unprotected. Concurrently with the battleships this form of protection was also fitted in the battle cruisers, but limited to the magazines and shell-rooms.

Finally, in the "Queen Elizabeth" (the torpedo menace having increased) the continuous longitudinal protective bulkheads were once more incorporated, and with the transverse protective bulkheads at each end, girdling the ship throughout nearly her entire length, so that not only shell-rooms and magazines, but engine- and boiler-rooms had the protection of a bulkhead 2 in. thick some 10 ft. from the ship's side, with the addition of another longitudinal bulkhead of 17 lbs. plating placed (at a distance of 7 ft. amidships and at varying distances at the ends) on the inner side of the protective bulkhead, further minimizing the risk of damage to the vitals of the ship from the effects of an explosion.

The arrangement of the protective bulkheads in the "Royal Sovereign" class generally followed that of "Queen Elizabeth," but their thickness was 1½ inches.

The efficiency of this system of protection, which a series of experiments had established, was demonstrated at Jutland, and it was further improved upon by the later forms of bulge protection.

The construction of British battle cruisers had proceeded concurrently with that of the battleships, although in smaller numbers. The demands made upon the engineering staff to provide for the large increases of power already referred to involved many difficult problems, but the "Indefatigable" was nevertheless completed (in 1911) within two years of laying down, and the later ships, "Lion," "Princess Royal," "Queen Mary," and "Tiger," followed on in succeeding years, each marking some advance in power and speed. Two other battle cruisers of the "Indefatigable" type, viz. "New Zealand" and "Australia," built for the Dominions from whence they took their names, had also been completed and were available for reinforcing the battle cruiser squadrons.

When the World War broke out in Aug. 1914 there were, moreover, four capital ships building in England for foreign Powers—two for Turkey and two for the Chilean Government. The two Turkish ships had just been completed and commissioned, one at Armstrong's and the other at Vickers', and were on the eve of sailing when war was declared. As both vessels were subject to pre-emption in the event of war, the Government promptly took them over and added them to the British fleet under the names of "Agincourt" and "Erin" respectively.

Of the two Chilean ships building in England at Armstrong's, the "Almirante Latorre" (10 14-in. guns and 16 6-in. guns) was the further advanced, and she was taken over and renamed "Canada." She was completed in Sept. 1915. The "Almirante Cochrane" was taken over in 1918 for conversion into an aircraft carrier, being renamed "Eagle."

There were thus at the outbreak of war the following completed capital ships on the offensive British list:—

"Erin" and "Agincourt" (purchased)	2
"Iron Duke" class	2 ¹
"King George V." class	4
"Orion" class	4
"Colossus" class	2
"Neptune"	1
"St. Vincent" class	3
"Bellerophon" class	3
"Dreadnought"	1

Battleships 22

"Queen Mary"	1 ¹
"Lion" and "Princess Royal"	2
"Indefatigable," "Australia," and "New Zealand"	3
"Invincible," "Inflexible," "Indomitable"	3

Battle cruisers 9

The total armament comprised in the above completed ships was as follows: 134 13.5-in. guns; 162 12-in.; 60 6-in.; 360 4-in., of which 18 were anti-aircraft¹; 62 3-in. and 12-pdr., of which 38 were anti-aircraft; 46 6-pdr. and 3-pounder.

Of the older battleships, from the "Majestic" class (1895) onwards, the British navy possessed:—

"Lord Nelson" class	2
"King Edward VII." class	8
"Swiftsure" class	2
"Duncan" class	5
"Formidable" class	2
"Canopus" class	6
"Majestic" class	9

These older ships, whose speeds ranged from 17 knots to 19½ knots, comprised a total armament of 152 12-in.; 8 10-in.; 52 9.2-in.; 28 7.5-in.; 416 6-in.; 28 14-pdr., and 530 12-pounder. They were, of course, not in a position to meet modern "Dreadnoughts" on equal terms, but they compared favourably in offensive and defensive qualities with contemporary German warships, while being numerically in considerable superiority. They all rendered useful service during the war.

The old "Revenge," completed in 1894 (renamed "Redoubtable" in 1914), the last available vessel of the old "Royal Sovereign" class, was commissioned and rendered useful service in the Belgian coast bombardments of 1914 and 1915.

In addition to the "Tiger" and the two remaining ships of the "Iron Duke" class which were approaching completion, there were five "Queen Elizabeths" in a more or less advanced state of construction, and five "Royal Sovereigns" laid down eight to ten months previously. The "Queen Elizabeth," being the farthest advanced, was pushed on with all possible speed, and by Jan. 1915 she was sufficiently completed to be commissioned and sent out to the Mediterranean, where she took part in the bombardment of the Dardanelles forts.

With regard to the design of British capital ships in the past, a most serious limitation had been the restricted width of the graving-docks in Great Britain. This involved keeping the extreme beam of the ships within about 90 feet. Had wider docks been available, thus making it possible to have had a greater beam, the designs on the same length and draught could have embodied more fighting qualities, such as armour, armament, greater stability in case of damage, and improved under-water protection. This condition subsisted until the completion of the two big floating docks for Portsmouth⁴ and the Medway, the two locks at Portsmouth, and the large graving-docks at Rosyth; but the shortage of wide docks was a serious handicap during the war, and it was necessary to make use of the Gladstone Dock at Liverpool and the dock at Avonmouth.

¹ Two more nearly complete.

² One more ("Tiger") nearly complete.

³ The anti-aircraft armament was not provided until after the outbreak of war, when such provision became necessary.

⁴ Portsmouth floating dock was transferred to Invergordon in 1914, and the Medway Lock to the Tyne in 1915.

but the growth in displacement necessitated a corresponding increase in power to attain the requisite speed. The use of oil fuel in association with coal was maintained until the "Queen Elizabeth" class was reached, when the greater advantages of oil fuel and the improved methods of its combustion finally caused the abandonment of coal as fuel. A noteworthy feature of these remarkable vessels was the advance in speed to 25 knots, necessitating, on a slightly larger displacement than that of their predecessors, an increase of about 150% in the power.

Concurrently with the development of the battleship proper, that of the British battle cruiser may be followed with advantage. Up to the inception of the "Dreadnought" design nothing more ambitious than an armament consisting of 9 2-in. guns associated with 7.5-in. guns ("Warrior" and "Minotaur," 1903-4) had been attempted in armoured cruisers. But the same reasons which caused the evolution of the all-big-gun battleships from the mixed armament of the "King Edward VII." and "Lord Nelson" classes now called for a similar simplification in the armoured cruiser designs. The outcome of this policy was the production of the "Invincible" class of "cruiser battleships," now generally known as "battle cruisers."

In these vessels the additional power necessary for their 4 to 5 knots superiority of speed over the "Dreadnought" was obtained at the sacrifice of two 12-in. guns and some loss of armour protection. The value of speed, which in battleships had always been a debatable point, was, of course, incontestable for the battle cruisers, and the development of the type has, both before and since the outbreak of the war, kept pace with the insistent demands of the strategist for the highest speed obtainable. Within the 10-year period referred to above, the increase in speed and power from the "Invincible" (25 knots for 41,000 H.P.) to the "Renown" (32 knots for 120,000 H.P.) required an increase in displacement from 17,250 tons to 26,500 tons, the relative increase in power being over 100 per cent. Finally in the "Hood" a speed of 32 knots with 144,000 H.P. on a displacement of 41,200 tons, an increase of 235% in power was involved.

The wisdom of the policy which initiated this new era in naval construction, relegating temporarily into the background the former British supremacy in capital ships, was naturally the subject of much criticism. But evolution in warship construction is not the property of any one navy, and there is little doubt that, at the conclusion of the Japanese war, the world stood on the threshold of a new era in naval architecture. If British naval supremacy was to be maintained it had to be done by leading the world along the new path of warship design, without waiting for others to utilize the advantages that had been rendered possible by progress in armour, guns and machinery. sive. There were not only many more farmers in 1921 than in 1910, but the investment per acre was much greater. The homes, barns, stables and granaries more recently erected are usually well built, are much larger than those of the past and have modern conveniences. Practically all of the towns with a population of 2,500 have their own electric light plants. The Homestake Mining Co. has a power plant costing about \$2,000,000. The 1919 Legislature provided for an hydro-electric commission and appropriated \$50,400 for the purpose of surveying the Missouri river to find water power. The engineers found three sites—Molbridge, Mulehead, and Medicine Butte—to be advantageous, in the order named. The commission presented a report to the 1921 Legislature and recommended that the Molbridge site be developed. It estimated that the dam and plant would cost \$9,400,000 and the transmission system \$7,833,000. Under the economic conditions existing in 1921 the Legislature hesitated to act favourably and the question was to be submitted to the people in the election of Nov. 1922. The following table shows the increase of farm products.—

		Acreage	Production	Value
Corn	1919	2,756,234	69,060,782 bus	\$89,779,076
"	1909	2,037,658	55,558,737 "	26,395,985
Wheat	1919	3,891,468	31,086,995 "	69,323,046
"	1909	3,217,255	47,954,590 "	42,878,243

In 1919 receipts for the sale of dairy products were \$12,222,562; of chickens, \$1,477,500. The total value of domestic animals on farms was \$232,364,625.

Minerals—The value of the minerals produced in the state in 1919 was \$5,500,000. Prof. Freeman Ward, state geologist, has computed the mineral products in yearly averages for the five-year periods, 1905-9 and 1915-9, as follows:—

	1905-9	1915-9
Bentonite		\$5,480
Coal	\$4,000	23,500
Copper	2,200	3,000
Gold	6,000,000	6,600,000
Gypsum	10,000	45,000
Lythia	1,000	38,680
Mica	50,000	10,400
Natural gas	18,120	19,000
Silver	97,900	126,000
Stone		
Crushed	23,480	80,000
Limestone	15,000	31,140
Sandstone	140,000	100,000
Structural materials	371,800	310,400

Manufactures—The following table indicates the growth of manufactures:—

	1919	1909
Number of establishments	1,414	1,020
Proprietors and firm members	1,410	942
Salaried employees	1,242	682
Wage earners (average)	6,382	3,602
Capital	\$30,933,030	\$13,017,932
Salaries	2,076,199	615,621
Wages	7,905,426	2,297,512
Cost of materials	42,985,870	11,476,350
Value of products	62,170,782	17,870,135
Value added by manufacture	19,184,912	6,393,785

The principal industries in 1919 were flour-mill and grist-mill products, bread and other bakery products, printing and publishing, automobile repairing, cars and general shop construction and repairs by steam railway companies, lumber and timber products.

Doane Robinson, secretary of the state History Department, estimates the value of the total production of all commodities as \$581,119,000 in 1918; \$481,624,000 in 1919; and \$316,305,000 in 1920. He gives the produce sold outside of the state as \$270,536,000 in 1918; \$376,720,000 in 1919; and \$324,667,000 in 1920.

Finances—The bank deposits were \$206,496,073 in 1918; \$235,617,276 in 1919; and \$251,804,649 in 1920. They were protected by a depositors' guarantee fund amounting to \$1,247,397 in 1920. The total assessed valuation of all taxable property was \$1,598,544,562 in 1918, \$2,095,154,178 in 1919, and \$2,257,853,656 in 1920. The

assessed valuation was usually not above half the real value, but even so amounted to \$3,547 per capita in 1920. The tax levied was \$17,781,439 in 1918, \$21,470,598 in 1919, and \$27,550,312 in 1920. The expenditure for the state Government, education, charitable and penal institutions was \$1,255,593 in 1910, \$9,711,964 in 1920. The state's debt in 1910 was \$1,073,575 which was reduced until in 1919 the funds in excess of the debt amounted to \$35,785. In addition there were in 1920 outstanding bonds, covering rural credit, highway and land settlements, amounting to \$33,800,000.

Since 1917 South Dakota has had a noteworthy state rural credit system. Up to 1921, 13,575 applications had been made for loans amounting to \$61,243,000. The rural credit board conservatively allowed only 7,915 loans, amounting to \$31,083,450. This is more than four times the business done in the state by the Federal Farm Loan Board. The state can borrow money several per cent below the rate paid by individuals, and gives the farmers this advantage. The rural credit system having proved a success, the voters at the election of 1920 empowered the Government to make similar provisions for people in the towns. A law was consequently passed by the Legislature to create a municipal credit board and to make state loans to individuals for the purchase of homes. The state insures crops against hail at a low rate per acre. The Government administrative departments have been enlarged and a number of new commissions or departments have been created, including the following: insurance, railways, free circulating library, marketing, highway, rural credit, industrial, immigration, pure food and drug, state engineer, budget, tax, agriculture, charities and corrections, bank, depositors' guarantee fund, securities, health, pharmacy, live stock (sanitary), game and fish, coal mines, land settlement.

History—South Dakota remained strongly Republican throughout the decade 1910-20. Of the political questions before the people the primary election law received the greatest attention. Successive Legislatures failing to deal with the matter by statute, an appeal to the initiative was successfully made at the election of Nov. 1912. Several months later, the Legislature of 1913 passed an Act of its own, and submitted it to the people at the 1914 election. It failed and the 1912 law remained in force. Thereupon the 1915 Legislature repealed the 1912 law and enacted one of its own, only to have the 1912 law in a somewhat revised form carried in the 1918 election. There has been much progressive legislation. The Non-Partisan League is a strong and active organization, but since a number of its policies have been adopted and carried out in legislation by the older parties it has not gained control of the Government. The code was revised and published in 1919. The number of men supplied by the state in the World War was 35,000, 10,000 being volunteers. There was purchased, in the state, of the Liberty and Victory bond issues \$700,627,200. A bonus was voted for those who served in the World War and the sum of \$6,000,000 appropriated for this purpose. Ex-service men engaged in farming are also given a state loan for "purchase of land, improvements and live stock to be placed on the land." The loan may be as high as 70 and even 90% of the value, and is payable on the instalment plan over a period of 30 years.

The governors since 1910, all Republicans, were Robert S. Vessey, 1909-13, Frank M. Byrne, 1913-7, Peter Norbeck, 1917-21; William M. McMaster, 1921- . (C C.)

SPA (see 25 525)—Pop. (1900) 8,293. The Germans occupied the town, which was undefended, on Aug. 4 1914, and it became first a hospital base and, later, a place of convalescence for their sick and wounded. The German Great G.H.Q. was transferred here from Kreuznach in March 1918 and the Kaiser fled from the Château du Neubois, 2½ m. E. of the town, into Holland on Nov. 8 1918. His concrete dugout at the château is preserved intact and shown to visitors. A conference of the Supreme Council of the Allies was held at Spa in July 1920.

SPAIN (see 25 527).—At the census of 1910, the total pop. (including the Balearic and Canary Is, as well as the territories of Northern Africa, but not those of the Guinea Colony) was 20,364,392, giving a density of 34.49 per sq. kilometre. The maximum density corresponds to the province of Biscay (161.59 per sq. km) the minimum to that of Lerida (21.45). Figures above 100 per sq. km. are given by the province of Barcelona (148.46); Guipuzcoa (120.28); Pontevedra (112.80), and Madrid (100.80). There are only eight towns of more than 100,000 inhabitants, namely, Madrid (599,807), Barcelona (587,411), Valencia (233,784), Seville (158,287), Malaga (136,365), Murcia (125,057),

Saragossa (111,704), Cartagena (102,542). The birth rate varied between 2.83 and 3.08 per 100 inhabitants for the period 1914-9, 0.16 per 100 inhabitants being illegitimate. The marriage-rate fluctuated between 0.65 and 0.67 per 100 inhabitants during the war years, and made a sharp rise to 0.81 in 1910. In the same period the death-rate varied between 2.13 and 2.31 per 100 inhabitants, with an exceptional rise to 3.31 in 1918. Infant mortality is very high, being 20.20% of the total of deaths for infants of less than one year, and 16.73 between one and four.

Education.—There were in 1910 59.35% people who could not read (figure including and referring to all ages). In 1919, 51,815 youths (of which 3,730 were females) were studying in secondary schools. In the same year 23,600 students were inscribed in the 11 universities of the country. This figure does not include numerous special and technical colleges, catering for certain professions such as architecture, engineering, veterinary science, etc., or the numerous agricultural, and arts and crafts, schools financed by the Government, municipalities and provincial councils.

Agriculture.—Some progress is shown in area and production. Wheat crops oscillate near an average of 3,265,000 tons and reached their maximum at 4,145,751 in 1916. The wheat area averages 3,809,464 hectares. Barley shows greater fluctuations with an average of 1.5 million tons. Maize keeps close to its average of 0.6 million tons, while oats remain at 0.4 million tons. Vineyards suffer from parasitic trouble, and the area planted diminished gradually from 1905 (1.4 million hectares) to 1914 (1.2) then began to grow again, but without reaching its previous value. Yet the maximum crop corresponds to 1917 with over 4 million tons, of which 3.8 million were transformed into wine and produced 23.7 million hectolitres. The olive area grows steadily, and reached 1.6 million hectares in 1918. The maximum crop corresponds to 1911 with 2.2 million tons of olives, of which 2.1 were transformed into oil (0.4 million tons). The average figures are about half. Sugar, both cane and beetroot, is cultivated, but while cane decreases, beetroot shows an irregular increase in area (36,741 hect. in 1911, 66,000 in 1918). This increase does not, however, correspond to a similar increase in production. The best year was 1913, with 1.3 million tons, and the worst 1918, with 0.672 million tons. While the average value of the annual agricultural production of the country in 1903-7 was estimated at 3,824,394,425 pesetas (£152,975,777), it was valued at 7,975,623,025 pesetas (£319,024,921) in 1916. A growing tendency is manifest towards the use of mechanical implements, of which there are several manufacturers in the country. More important machinery is imported, mostly from America.

Mining.—Mining was much stimulated by the war, the high price of coal having allowed the working of deposits which would not have been economically workable in normal conditions. Some Spanish products played an important role in the war, thus, pyrites were in high demand. The total value of the production of Spanish mines passed from 453 million pesetas in 1910 to 1,323 millions in 1917.

Railways.—There are 14,902 km. of railway lines, of which 11,378 are normal and 3,524 narrow gauge. In 1918, the number of persons conveyed rose to 75,480,648, or an average of 206,796 daily. In the same period the transport of goods rose to 35,244,659 tons. Gross receipts amounted to 557,931,445 pesetas, or 37,000 per kilometre.

Pre-war and after-war traffic figures are as follows—

	Persons	Goods (tons)
Pre-war average	50,350,000	29,090,224
1920	84,300,000	35,351,920
Increase	33,950,000	6,261,697

When war broke out, the Spanish railways were going through a crisis of growth, the traffic of the country having developed in excess of the railway plant, while the companies found themselves too near the date when they had by statute to revert their lines to the State, to be able to borrow money on good terms. The war aggravated this situation by all but stopping coast-shipping. Since then, a great increase in salaries and wages, as well as the rise in the price of coal and materials, has completely upset railway finance. An increase of 15% in rates was allowed after much opposition, and another is proposed which public opinion refuses to countenance. Several schemes are afoot to cope with the difficulty, all of them including a greater or lesser measure of State interference.

An electric railway line is proposed to link Oax with Madrid and Algeciras, by means of a French-gauge line, to be linked up in the future with Moroccan lines. This scheme is subordinate to a general scheme for the harnessing of water power in the whole peninsula, through the construction of hydro-electric stations and a polygonal distribution line. A further advantage of the scheme would be that the numerous deposits of second-rate fuel existing in the peninsula would then be economically exploited in the production of electricity.

Merchant Marine.—Despite heavy war losses, the merchant fleet was in 1920 slightly larger than in 1914. The figures for 1920 were:—

		Ships	Tons
Sail	more than 500 tons	38	53,906
	less than 500 tons	516	60,639
Steam	more than 500 tons	379	840,007
	less than 500 tons	259	52,640
Total		1192	1,007,192

This represents an excess of 318 sailing vessels with 81,575 tons and 10 steam vessels with 48,325 tons over 1914.

Industry and Commerce.—The war gave great stimulus to Spanish industries. Though many enterprises born out of the artificial conditions created by an exceptional Allied demand died out with the peace, progress is to be observed, particularly in Catalonia, Biscay and Asturias. Thus, while in 1905 there were in Spain 775 business corporations with an aggregate capital of 5,633 million pesetas, there were in 1916 no less than 2,435 of such corporations with a capital of 9,456 million pesetas. The average value of foreign trade for the pre-war period was about 2,250 million pesetas, or 112.90 pesetas per head. The war radically altered the régime. The commercial balance was against Spain in 1911. An excess of imports over exports, which had reached 150.5 million pesetas in 1900, fell to 3.6 in 1904, exceeded 100 millions in 1905 and 1906, fell to 2 millions in 1907, and varied between 16 and 75 millions in the following years, while in 1912 there was a 10.6 million excess of exports. 1913 and 1914 saw high excess of imports again (229 and 170 millions), but after the war régime began in 1915 Spain registered in 1918 her maximum favourable balance, amounting to 338 million pesetas. Considerable imports of gold and silver tended to neutralize this figure in the total commercial statistics. The value of the peseta rose accordingly (see EXCHANGE, FOREIGN).

Banking.—The Bank of Spain increased its gold reserves considerably. From 576 million pesetas in 1914, they grew to 2,415 million pesetas in 1919. Banks developed in all parts of the country, and, with the end of the war, a general invasion of foreign banks was also to be observed. English banking, which till then had not seemed to be interested in the peninsula, appeared in Spain, and now forms an important feature in Spanish business, not only in Madrid, but in Barcelona, Valencia, Seville, etc.

Finance.—The Budget shows an increasing deficit due mostly to two causes—on the expense side, an increase in numbers and salaries of the bureaucracy, on the receipt side, a failure to reorganize taxation on a sound basis of direct taxes. If 1900 be taken as a unit (100), expenditure grew steadily up to 168 in 1918, while receipts grew to 134, including Treasury bills. The actual figures in pesetas for 1920-21 were—Expenditure, 2,403,730,313.69; receipts, 1,842,720,570.32; the deficit being 561,009,743.37. The Public Debt, which had diminished by 2,000 million pesetas in 1910, had reached its previous amount again in 1918, and in 1920 was 11,926,295,232 pesetas.

History.—The closing months of 1910 were occupied by important legislation carried on by the Canalejas Government. The "padlock" bill, forbidding the settlement of further religious communities in Spain until the Canalejas Ministry negotiations with the Vatican were completed was carried in the Senate (Nov. 4) and a compulsory service bill introduced while the Chamber discussed a Municipal Taxation Reform Bill with a view to the suppression of the unpopular octroi. Meanwhile, Señor García Prieto, after laborious negotiations, brought to a head the Spanish-Moroccan Agreement, which was signed in Nov. (see MOROCCO). The Agreement was well received by all political parties except the extreme Left. A bill was introduced and passed, regulating work in the mines, a moderate measure but a step in the right direction. An important political event, the breaking up of the Republican-Socialist block which had been created under the Maura-Cierva reactionary administration, was brought about unexpectedly by a debate on the Barcelona water supply. Señores Azcárate, for the Republicans, and Iglesias, for the Socialists, having expressed their disapproval of the action taken in the matter by Señor Lerroux and his radical followers, who controlled the municipality of Barcelona, a rupture ensued. Thus began the gradual weakening of the anti-dynastic Left, which continued in later years. The "padlock" bill was passed by the Chamber of Deputies on Dec. 22.

Schöer Canalejas' Cabinet ended the year greatly strengthened by its vigorous legislative policy. Yet, on the last day of the year, the prime minister being desirous of reconstituting his ministry handed in his resignation, and the King having renewed

him his confidence, the new Cabinet was sworn in slightly reconstituted. The crisis thus settled, the King visited Melilla (Jan. 7-13) amidst scenes of great enthusiasm, France being represented by Gen. Toutée and by the warship "Du Chayla." Rumours of a Spanish intervention in Portugal began to circulate then but were promptly met by a strong denial from Señor Canalejas himself. This second Ministry lasted till April 3. Its main efforts were spent in securing unanimity for the negotiations with the Vatican, the most important point of which was the drafting of a new Associations Bill to apply to religious as well as to ordinary communities or societies, the Vatican refusing to renew negotiations unless the Spanish Government agreed to submit its bill to the approval of the Holy See. Señor Canalejas naturally resisted such a condition.

Associations Bill.

The Government was somewhat weakened by the attacks of Señor Urzáiz and Señor Azcárate on its financial policy particularly on their bills for the reform of the Public Debt and for certain alterations in the working of the Bank of Spain. But the end came from another quarter. A debate on the Ferrer case (*see* 25 568) gave rise to an extremely grave crisis. An outspoken speech by Don Melquades Alvarez was answered by Señor Canalejas in a half-hearted way, which did not sufficiently conceal the fact that the prime minister was not far from agreeing with the opponents of the military court which had sentenced Ferrer. A deep discontent was soon manifest in the ranks of the officers of Madrid, and the War Secretary, Gen. Aznar, intimated that in his opinion the debate should be closed at once. Señor Canalejas submitted the resignation of the Cabinet to the King, who renewed his confidence to his prime minister. The new Cabinet appeared before the Cortes, and the debate on Ferrer's case was proceeded with in a somewhat cooler atmosphere. The incident was, however, typical as a forerunner of much that was to come in future years.

The attention of Parliament was soon diverted towards Moroccan affairs. The French were preparing their advance on Fez, a fact which forced Spain to an active policy in order to maintain her much diminished rights in Morocco. The first signs of this policy were received with ill humour by the French press, and a press duel began then between the two nations which was to last to the very eve of the World War. Meanwhile the Government had introduced its long expected Associations Bill (May 8), which provoked a protest from all the archbishops and bishops headed by the primate. The Government were successful in passing the bill for the suppression of the *oceros* (May 22). This success initiated a campaign of active opposition from the Conservatives, the aim of which was to defeat the bill in the Senate, but the plan failed, for the bill was passed by the Senate by 178 to 63 (June 3). The fact was significant of the amount of determination exercised by the Crown, for if it had not used its influence over the non-elective part of the Senate the Government would have been defeated by the Conservative vote.

The Government, meanwhile, in the teeth of popular opposition, rendered more dangerous by several strikes, was sending troops to Morocco and preparing for events. On June 9, Spanish troops landed at Larache, thus putting France before a *fait accompli* which was not much to the taste of the Quai d'Orsay. France, however, was prevented from taking any strong action by the sudden arrival of the "Panther" at Agadir, but a certain tension prevailed between France and Spain all through the summer. At the same time, popular opposition to the war, not only to that which was going on in Morocco but to that which it was feared was going to break out in Europe as well, was spreading, and tended to encourage the extreme parties. Meetings took place in Barcelona and Madrid, this last one being stimulated by the presence of two French "comrades"; and a Republican rising plotted by the lower deck of the cruiser "Numancia," though unsuccessful, startled public opinion. The movement seems to have been connected with political efforts to overturn the monarchy, which were being prepared on land.

The greatest danger, however, was to come from a campaign of strikes which began early in the year. In Sept., nearly all these strikes still dragged on, and their effect was further aggravated by the feeling that the Government was attempting a big operation in Morocco behind the backs of the people. Grave disorders occurred in the Bilbao district, where 20,000 steel smelters went on strike, and the situation developed soon into a general strike, which spread to the coalfields of Asturias. The Government, which at first seemed inclined to favour the workers for the sake of national conciliation in view of the international situation, gradually veered round. They began by suspending the constitutional guarantees in Biscay (Sept. 12); then, on receipt of grave news from Asturias, in the whole of Spain (Sept. 19). By this time, the movement had spread to nearly the whole peninsula, and grave disorders had occurred in Catalonia and Valencia, notably in Cullera, where a magistrate was mobbed to death. The Government met the situation with coolness and resolution, and by Sept. 22 the strike fever had abated upon the settlement of the Bilbao strike.

Labour Troubles.

General Luque himself, though then a War Secretary, was sent to Morocco to preside over the operation, which began successfully on Dec. 6, but collapsed a few days later after a gallant attempt to force the passage of the River Kert. The Spanish press voiced a belief, then current in the Spanish army, that the Moorish tribes were provided with French arms and ammunition, and the imprisonment by the French Gen. Toutée of several French officials in Ujda gave some colour to this view, much resented though it was by the French press. General Luque, though in a veiled manner, suggested in an interview to the press that his failure had been due to lack of French co-operation. Under such unfavourable conditions began the negotiations for a Franco-Spanish agreement following upon the Franco-German Treaty on Morocco. The Spanish troops were soon attacked on the River Kert, and rumour attributed the move to French initiative. The matter had to be smoothed over by the Foreign Secretary, Señor García Prieto (Dec. 28).

Morocco: Tensions with France.

During the first days of the new year the case of the Cullera riots came before the military supreme court. The court pronounced seven death sentences, and a press campaign started at once for the reprieve of the seven condemned men. Señor Canalejas seized the opportunity to make the King benefit by the popularity which always follows acts of clemency. He brought his Cabinet unanimously to agree that six out of the seven men should be reprieved, but that the seventh, the head of the riot, known as *El Chato de Cuqueta*, could on no account be recommended for mercy. He then allowed King Alphonso to be besieged by petitioners, including the old mother of the doomed man, who was granted a special audience, so that the King might be provided with an excuse for reopening the affair. Thereupon, Señor Canalejas agreed to reprieve *El Chato*, but resigned. Though the resignation was purely formal, the King took for himself all the merit of the act of clemency, and a wave of popular gratitude was his reward. Thus by a mixture of mercy and ability, Señor Canalejas reversed in 1912 the position which Señor Maura had created by his uncompromising policy of 1900, and this incident did much to harden Señor Maura in his attitude of "implacable hostilidad" to the Liberal party.

Cullera Riots Reprieved.

Much of the parliamentary session was spent in the usual recriminations wherewith the Conservative party endeavoured to weaken Señor Canalejas' position, and on March 11 Señor Canalejas had to sacrifice several of his colleagues, notably his Minister of Public Works, Señor Gasset. The King renewed his confidence to Señor Canalejas, and the new Cabinet was reshuffled. The inclusion (as Minister of Education) of Señor Alba, known to be a personal follower of Señor Moret, was considered as a token of reconciliation between Señor Canalejas and his former chief. Señor Canalejas seized the opportunity afforded him by this crisis to adjourn Parliament until May 1.

Canalejas Cabinet Reconstituted.

The salient feature of this interval was the launching of the Reformist party by Don Melquiades Alvarez, a moderate Republican working in close touch with Señor Azcárate and Señor Perez Galdós. In a first speech delivered on April 7, Señor Alvarez announced the formation of a Reformist party which would reconcile the moderate elements of the middle classes with Republican ideas. This was but the beginning of an evolution which was destined to bring a certain important portion of Republican opinion into the fold of the monarchy. On May 1 the Cortes was reopened and an agitated parliamentary session began, in which the main question in debate was the bill called "De Mancomunidades." This bill was a sop given by Señor Canalejas to Catalan opinion, for it allowed *Diputaciones* (elected provincial councils) to unite

Local Government Bill.

into groups for purposes of common administration, a measure which, though in appearance of a general character, was meant to enable the four Catalonian provincial councils to unite into a kind of local parliament. The bill caused a deep cleavage in the ranks of the Liberal party. General Weyler, Señor Montero Rios (president of the Senate), Señor Moret, and Count Romanones (president of the Chamber) were all emphatically against it. Señor Canalejas' difficulties were increased by the fact that, though the measure formed a part of a more ambitious Local Government Bill devised by Señor Maura during his last term of office, Señor Maura opposed it on the ground of its having been as it were taken from its context. Yet Señor Canalejas piloted his bill successfully through a hostile Chamber, and when, on July 5, he had the Cortes adjourned, the bill had been virtually passed. He, however, avoided a final vote, knowing that, on the bill appearing before the Senate, Señor Montero Rios would resign. His triumph was therefore more apparent than real.

With the summer a period of strikes set in. Saragossa, Málaga and the mining and steel-smelting district of La Felguera (Asturias), became restive with social strife (August). Reus, Madrid and Murcia also suffered from partial strikes. But all these conflicts were soon overshadowed by a grave railway strike which affected nearly the whole country. Señor Canalejas met it by applying Art 221 of the Recruiting Law, which in cases of danger or abnormal circumstances allows the drafting into military service of all men of military age working in industries of public importance; and this measure, combined with a really conciliatory policy, caused the collapse of the strike on Oct 5.

On Oct 14 the autumn session of the Cortes began, and three days later the bill "De Mancomunidades" was passed in the Chamber, but the work of the session was suddenly brought to a close by the murder of Señor Canalejas on Nov. 12. The prime minister was shot dead in the Puerta del Sol (Madrid) in broad daylight, while he was inspecting the books at a book-shop window. The emotion aroused by the crime was enormous. The King, with his usual impulsiveness, hurried to the Home Office, where the body had been laid, in the first carriage which he found at his disposal, then, on the day of the funeral, he walked in person at the head of the mourners, through the streets of Madrid. This brought him great popularity. Meanwhile, Count Romanones had replaced Señor Canalejas at the head of the Government, with the definite task of passing the budget and of completing the treaty with France. On Dec. 27 this treaty was signed, after laborious negotiations which had begun on Dec 6 1911. The discussion of the treaty occupied the remainder of the session, which Count Romanones closed at Christmas.

Murder of Canalejas.

Having thus fulfilled the programme for which he had been entrusted with the seals of office, Count Romanones gave the King an opportunity to alter his policy by tendering the resignation of the Cabinet. The King, without consulting any of his statesmen, gave Count Romanones a new lease of power. This decision finally settled the question of Señor Canalejas' successorship to the direction of the Liberal party in favour of Count Romanones.

Yet, his rival, Señor García Prieto, though bowing for the moment to the royal pleasure, signified his intention to stand for the leadership in the future by abstaining from a seat in the Cabinet, though coöperating with Count Romanones from outside. The Liberal solution of the crisis contributed further to increase the popularity of the King. The sensational withdrawal from public life which Señor Maura announced on Jan. 1 1913 worked in the same direction. In a lengthy note addressed to his followers he animadverted on the action of the King in having lent himself to a policy of coöperation between the Liberal opposition and the antidynastic Left. Señor Maura resigned his seat in the Chamber, followed by Señor La Cierva, and as these two names had symbolized reaction to the Spanish people since 1909, their withdrawal, in direct conflict with the King, enhanced the prestige of the Crown. Señor Maura's retirement was of short duration. On the 4th he saw the King; on the 10th he answered a message from his followers by accepting once more the leadership of the party.

Señor Alvarez, who meditated a *rapprochement* with the monarchy, made on this occasion a sensational speech, in which he had the courage to bestow great praise on the King at a public Republican meeting. Encouraged by the success of this first attempt, he spoke in the same strain in Murcia (Jan 12) and obtained from his Republican audience an enthusiastic ovation for the King's policy. Nor did King Alphonso sleep on his laurels. On Jan. 14 he summoned to the palace for consultation the three most eminent men of Republican Spain, Señor Azcárate, head of the Republican-Socialist Coalition, and a respected specialist in labour questions, Prof Cossío, a well-known pedagogist and art critic, and Señor Ramón y Cajal, the famous biologist. The significance of these interviews escaped no one, and least of all the Conservative Reactionaries. On Feb 11, these interviews were the main subject of speeches delivered by Señor Azcárate and Señor Alvarez at a Reformist banquet in Madrid, the net result of which was the public recognition by these gentlemen of the fact that, whatever obstacles there were to the democratization of Spain, they did not come from the Crown. The meeting, a further step towards the monarchy taken by the middle-class and intellectual section of the Republican party, served to outline a scheme of conditions and constitutional guarantees which the Reformist party would require in order to coöperate with the Crown.

Count Romanones took a good share of whatever merit there was in this policy. The death of Señor Moret (Jan 28) removed his most serious rival in the Liberal party. Count Romanones then endeavoured to persuade Señor Azcárate to accept the presidency of the Chamber, a clever move likely to reflect favourably on the prime minister, while avoiding the elevation of any would-be rival to the post considered in Spanish politics as the stepping stone to the premiership. Señor Azcárate refused, and Señor Villanueva was at last selected. The King's official visit to Paris, on completion of the Franco-Spanish treaty, had proved a success (May 6-9), and Count Romanones, having replaced Señor Villanueva by Señor Gasset as Minister of Public Works, felt strong enough to face the Cortes. But no sooner had he appeared before Parliament (May 26) than a speech by Señor Maura (28th) forced him to hand in his resignation. Señor Maura had merely re-stated his position of "implacable hostilidad" to a policy of coöperation with the parties of the antidynastic Left, and Count Romanones thought that no Liberal party could govern without a properly constituted Opposition, willing to take office on the fall of the Government. The crisis was again solved by the Crown in favour of the Liberal party. The King ratified the policy which Señor Maura had refused to countenance, and Count Romanones came back at the head of the same Government. But the discussion of the bill "De Mancomunidades," which at last had to come before the Senate, produced a still graver crisis, for it precipitated the division of the Liberal party, latent since the death of Canalejas. The group headed by Señor Montero Rios (president of the Senate), and his son-in-law, Señor García Prieto, dissented from that of Count Romanones on the prin-

Treaty with France.

Romanones Government.

him his confidence, the new Cabinet was sworn in slightly reconstituted. The crisis thus settled, the King visited Melilla (Jan. 7-13) amidst scenes of great enthusiasm, France being represented by Gen. Toutée and by the warship "Du Chayla." Rumours of a Spanish intervention in Portugal began to circulate then but were promptly met by a strong denial from Señor Canalejas himself. This second Ministry lasted till April 3. Its main efforts were spent in securing unanimity for the negotiations with the Vatican, the most important point of which was the drafting of a new Associations Bill to apply to religious as well as to ordinary communities or societies, the Vatican refusing to renew negotiations unless the Spanish Government agreed to submit its bill to the approval of the Holy See. Señor Canalejas naturally resisted such a condition.

Associations Bill.

The Government was somewhat weakened by the attacks of Señor Urzáiz and Señor Azcárate on its financial policy particularly on their bills for the reform of the Public Debt and for certain alterations in the working of the Bank of Spain. But the end came from another quarter. A debate on the Ferrer case (see 25 568) gave rise to an extremely grave crisis. An outspoken speech by Don Melquades Alvarez was answered by Señor Canalejas in a half-hearted way, which did not sufficiently conceal the fact that the prime minister was not far from agreeing with the opponents of the military court which had sentenced Ferrer. A deep discontent was soon manifest in the ranks of the officers of Madrid, and the War Secretary, Gen. Aznar, intimated that in his opinion the debate should be closed at once. Señor Canalejas submitted the resignation of the Cabinet to the King, who renewed his confidence to his prime minister. The new Cabinet appeared before the Cortes, and the debate on Ferrer's case was proceeded with in a somewhat cooler atmosphere. The incident was, however, typical as a forerunner of much that was to come in future years.

The attention of Parliament was soon diverted towards Moroccan affairs. The French were preparing their advance on Fez, a fact which forced Spain to an active policy in order to maintain her much diminished rights in Morocco. The first signs of this policy were received with ill humour by the French press, and a press duel began then between the two nations which was to last to the very eve of the World War. Meanwhile the Government had introduced its long expected Associations Bill (May 8), which provoked a protest from all the archbishops and bishops headed by the primate. The Government were successful in passing the bill for the suppression of the *oceros* (May 22). This success initiated a campaign of active opposition from the Conservatives, the aim of which was to defeat the bill in the Senate, but the plan failed, for the bill was passed by the Senate by 178 to 63 (June 3). The fact was significant of the amount of determination exercised by the Crown, for if it had not used its influence over the non-elective part of the Senate the Government would have been defeated by the Conservative vote.

The Government, meanwhile, in the teeth of popular opposition, rendered more dangerous by several strikes, was sending troops to Morocco and preparing for events. On June 9, Spanish troops landed at Larash, thus putting France before a *fait accompli* which was not much to the taste of the Quai d'Orsay. France, however, was prevented from taking any strong action by the sudden arrival of the "Panther" at Agadir, but a certain tension prevailed between France and Spain all through the summer. At the same time, popular opposition to the war, not only to that which was going on in Morocco but to that which it was feared was going to break out in Europe as well, was spreading, and tended to encourage the extreme parties. Meetings took place in Barcelona and Madrid, this last one being stimulated by the presence of two French "comrades"; and a Republican rising plotted by the lower deck of the cruiser "Numancia," though unsuccessful, startled public opinion. The movement seems to have been connected with political efforts to overturn the monarchy, which were being prepared on land.

The greatest danger, however, was to come from a campaign of strikes which began early in the year. In Sept., nearly all these strikes still dragged on, and their effect was further aggravated by the feeling that the Government was attempting a big operation in Morocco behind the backs of the people. Grave disorders occurred in the Bilbao district, where 20,000 steel smelters went on strike, and the situation developed soon into a general strike, which spread to the coalfields of Asturias. The Government, which at first seemed inclined to favour the workers for the sake of national conciliation in view of the international situation, gradually veered round. They began by suspending the constitutional guarantees in Biscay (Sept. 12); then, on receipt of grave news from Asturias, in the whole of Spain (Sept. 19). By this time, the movement had spread to nearly the whole peninsula, and grave disorders had occurred in Catalonia and Valencia, notably in Cullera, where a magistrate was mobbed to death. The Government met the situation with coolness and resolution, and by Sept. 22 the strike fever had abated upon the settlement of the Bilbao strike.

Labour Troubles.

General Luque himself, though then a War Secretary, was sent to Morocco to preside over the operation, which began successfully on Dec. 6, but collapsed a few days later after a gallant attempt to force the passage of the River Kert. The Spanish press voiced a belief, then current in the Spanish army, that the Moorish tribes were provided with French arms and ammunition, and the imprisonment by the French Gen. Toutée of several French officials in Ujda gave some colour to this view, much resented though it was by the French press. General Luque, though in a veiled manner, suggested in an interview to the press that his failure had been due to lack of French co-operation. Under such unfavourable conditions began the negotiations for a Franco-Spanish agreement following upon the Franco-German Treaty on Morocco. The Spanish troops were soon attacked on the River Kert, and rumour attributed the move to French initiative. The matter had to be smoothed over by the Foreign Secretary, Señor García Prieto (Dec. 28).

Morocco: Tensions with France.

During the first days of the new year the case of the Cullera riots came before the military supreme court. The court pronounced seven death sentences, and a press campaign started at once for the reprieve of the seven condemned men. Señor Canalejas seized the opportunity to make the King benefit by the popularity which always follows acts of clemency. He brought his Cabinet unanimously to agree that six out of the seven men should be reprieved, but that the seventh, the head of the riot, known as *El Chato de Cuqueta*, could on no account be recommended for mercy. He then allowed King Alphonso to be besieged by petitioners, including the old mother of the doomed man, who was granted a special audience, so that the King might be provided with an excuse for reopening the affair. Thereupon, Señor Canalejas agreed to reprieve *El Chato*, but resigned. Though the resignation was purely formal, the King took for himself all the merit of the act of clemency, and a wave of popular gratitude was his reward. Thus by a mixture of mercy and ability, Señor Canalejas reversed in 1912 the position which Señor Maura had created by his uncompromising policy of 1900, and this incident did much to harden Señor Maura in his attitude of "implacable hostilidad" to the Liberal party.

Cullera Riots Reprieved.

Much of the parliamentary session was spent in the usual recriminations wherewith the Conservative party endeavoured to weaken Señor Canalejas' position, and on March 11 Señor Canalejas had to sacrifice several of his colleagues, notably his Minister of Public Works, Señor Gasset. The King renewed his confidence to Señor Canalejas, and the new Cabinet was reshuffled. The inclusion (as Minister of Education) of Señor Alba, known to be a personal follower of Señor Moret, was considered as a token of reconciliation between Señor Canalejas and his former chief. Señor Canalejas seized the opportunity afforded him by this crisis to adjourn Parliament until May 1.

Canalejas Cabinet Reconstituted.

Conservative party. Parliament resumed its sittings on Oct. 30 and unanimously endorsed the foreign policy of the Government. The country was meanwhile recovering from the first shock of the war, getting used to abnormal conditions, and even beginning to realize that there might be some material profit to be made out of it. The pro-German press raised frequent protests against the enormous increase in exports to France which the Customs reported. Metals, raw and manufactured, clothes and boots, all kinds of foodstuffs, horses and mules, poured into France, under the "neutral" eye of the Government. Before adjourning the Cortes, however, the Government introduced and passed a bill which gave them special powers to deal with such matters as customs tariffs, railway rates, State purchases of food, shipping and expropriation of foodstuffs. A navy bill was also passed, authorizing the building or purchase of 4 fast cruisers, 6 destroyers, 28 submarines, 3 gun boats, 18 mine-laying and auxiliary ships, mines and submarine defences, aircraft, and several important naval land works in Ferrol, Cadiz and Cartagena. The Foodstuffs Act did not prevent a period of serious unrest in the spring, due to the scarcity artificially created, partly by excessive exports, partly by speculative holding up of stocks. Special Juntas, composed of the civil governor, the financial delegate and the mayor of the provincial capital, were set up in each province to administer all available stocks of food, and a policy of prohibition of exports was even initiated in March (1915). Yet the great increase in exports had contributed perhaps more than any other cause to the rise in the value of the peseta, a rise which gave the Government an opportunity to repatriate the Public Debt, *see* enacting that all Spanish Government stock held by foreigners which was payable in francs or sterling should become payable in pesetas in the Spanish market.

Though the Cortes was closed, great political activity was displayed, by all parties, with a view to a consolidation of the loose political forces of the day into that symmetric form of two rotating parties the need of which seemed to be felt as a habit by all concerned. This activity, which the Government had driven towards the press and public meetings by closing Parliament, was stimulated by an active German propaganda, soon to be imitated by similar endeavours on the part of the Allies. The mouthpiece of extreme pro-German views was Señor Vazquez de Mella, an eloquent and versatile Carlist professor and M.P., who on May 31 pronounced a strong pro-German speech in the Zarzuela theatre (Madrid), before a house full of Germans, Carlists and Maurists, and adorned by the presence of a cluster of aristocratic ladies, many of whom belonged to the Queen's household. But though the excitement produced by this and similar outbursts of partisan feeling did not go very deep, and though the mass of the people were not swayed out of the attitude which they had spontaneously assumed, the Government thought there might be some danger in liberty, and they decided to deny all permits for meetings on neutrality and the war. Despite many complaints, for the measure was obviously illegal, the Government held fast to their decision.

It is worth noting that while this protest from all political groups, including the two sections of the Liberal party headed by Count Romanones and Señor García Prieto, failed to shake the power of the Government, a crisis was precipitated on the refusal of the business community to coöperate with the Government in the launching of a loan. The Finance Minister, Señor Bugallal, prepared an issue which was expected to yield 750 million pesetas (£30,000,000), 283 of which were already covered by exchange for an equivalent sum in short-term bonds. The new money to be found did not therefore exceed 467 million pesetas, or a little over 19 millions sterling. Now, of this sum, no more than 52 million pesetas (just above 2 millions sterling) was subscribed, and it was noted that small subscriptions far exceeded the sums subscribed by big owners of capital. Several explanations were put forward, but the main cause of the failure seems to have been a reluctance of business circles to subscribe under conditions

which were not considered generous enough for the subscriber. The resignation of the Government (June 22) as a result of this failure was quickly followed by a reinstatement of the same Cabinet, despite the insistent desire for retirement manifested by the Minister responsible, Count Bugallal. The situation of the Treasury was by no means flourishing. The estimates for 1915 had been set at 1,465 million pesetas against 1,281 million pesetas revenue. But as months went by, both sides of the account showed signs of moving in the wrong sense. The liquidation at the end of the year was to show that revenue would remain at 1,202 million while expenses, not including Government purchases of foodstuffs, were to rise up to 1,556 million. The Government had to fall back on Treasury Bonds negotiated through the Bank of Spain.

The difficulties were of course of a purely administrative order, for the work of the country was in full swing under the stimulus of war orders. As one sign of this growing industrial coöperation between Spain and the Allies, *Industrial Prosperity.* the shipowners announced to the Government (Aug. 1915) that the premiums granted them by the Shipping Acts as a measure of protection were no longer necessary and would not be cashed. This was, of course, but a euphemistic way of hinting that such premiums were no longer worth the sacrifice which they entailed of the shipowner's liberty to trade as he pleased between foreign ports. Great shipping profits ensued, and torpedoings followed. On Aug. 17 the s.s. "Isidoro" of Bilbao was sunk by a German submarine. On Aug. 20 the s.s. "Peña Castillo" of Santander sank in obscure circumstances. Public opinion was divided as to the right attitude to take in these circumstances, and while it was generally recognized that some sort of protest should be made, the free hand claimed and obtained by shipowners for the carrying on of their highly profitable industry was a serious handicap to their case.

Though the war absorbed most of the political interest of the day, several efforts were made to reunite the Liberal groups into one party again, and these efforts having failed, owing mainly to the unwillingness of either leader to *Fall of the Dato Government.* surrender his claims to the leadership of the whole, Count Romanones, the more active of the two, prepared a plan of campaign against Señor Dato's Government on the Military Reform Bills then being prepared by the War Secretary, Gen. Echagüe. General Echagüe introduced his bills, and Señor Dato declared that the Chamber would have to pass them before discussing the budget. Count Romanones was adamant against this condition imposed by a Government which had kept Parliament closed for the best part of the year, and the Government fell on Dec. 6.

This crisis is worth recalling for it marked a further step in the approximation of Don Melquiades Alvarez to the monarchy. King Alfonso having expressed a wish to hear Señor Alvarez' opinion along with that of the leaders, the chief of the Reformist party called at the royal palace for the first time. The crisis ended in the formation of a united Liberal ministry (the two groups having melted into one as they came nearer the warmth of office). Count Romanones took the premiership, and, in order to counterbalance the effect of his well-known pro-Ally views, assigned the Foreign Office to Señor Villanueva, a notorious pro-German. Señor Barroso (Justice) and Señor Burell (Education) represented the García Prieto faction. Señor Urzáiz, an independent and outspoken Liberal, went to the Exchequer, probably at the suggestion of the King, who also caused Admiral Miranda, though a Conservative, to remain at the Navy Office. General Luque came back to the War Office, and Senator Salvador was appointed Minister of Public Works. *Romanones Cabinet of Re-united Liberals.*

The programme of the Government was very much the same as that of its predecessor: neutrality, military bills, financial and economic reforms, and the budget. In a sense, the inclusion of Señor Urzáiz, who, though a Liberal, was a party unto himself, and of Adml. Miranda, a Conservative, initiated the period of mixed ministries, which was about to open as a logical consequence of the gradual weakening of the old parties, and in its

turn would accelerate the process of their disintegration. The experiment, so far as Señor Urzáiz was concerned, proved a failure. A man with a strong will and little adaptability, he came into conflict with his chief and was dismissed before he had time to resign (Feb. 25). The union of the two branches of the party which this Cabinet consecrated was apparent. Apart from the underlying cleavage between the García Prieto and the Romanones groups, the party showed further signs of division owing to the rising ambitions of Señor Alba, who by a clever use of the opportunities of his new office, made for himself an enviable reputation of a bold democratic tax-legislator. His bill on war profits aroused the opposition of all the minorities except the socialist. Yet Count Romanones, with a fine political flair, backed his Finance Minister. The matter, however, was purely political, for the bill had not been passed when the Cortes was closed, a general railway strike having suddenly upset all Government plans on July 13. Count Romanones faced the conflict with an unusual luxury of precautions, constitutional guarantees were suspended in the whole peninsula, and martial law declared in Madrid. But the strike was over one week later, and the autumn session was too deeply occupied in the discussion of Señor Alba's ambitious budget schemes to think of the War Profits Bill. The discussion of these schemes dragged on till Dec. 10, when it was resolved to validate the old budget for the coming year, while the new one was further discussed. The Government reappeared before the House on Jan. 10, but in the meantime Count Romanones had resigned and accepted office again with the same ministry. This curious crisis (Jan. 9) was probably devised by the prime minister as a means to recover from the King the moral authority which some thought he had lost at the hands of the pro-German press, which accused him of drawing great profits as a business man from his foreign policy as a prime minister.

Count Romanones wore his neutrality with a difference, and, though the inheritor of Señor Dato's policy, he did little to conceal his pro-Ally views. The natural development of the war made every day more urgent the need of defining a policy which would be something more than a mere passive attitude. By Sept. 1916, Spain had lost more than 30,000 tons of shipping by torpedoing, and more than 50,000 in circumstances which were, to say the least, obscure. The shipping interests asked for Government help. A period of Government activity set in, during which Count Romanones was loyally seconded by Señor Gimeno, a pro-Ally Foreign Secretary, but the pro-German press countered by a fierce personal campaign against the weakest flank of the Government, the prime minister's industrial interests. On Jan. 31 Germany sent in a note establishing an "absolute blockade" of the Allied coasts. Count Romanones was committed to a policy which implied a firm answer to such a note. He gave it, for, though somewhat watered down by his pro-German colleagues, the Spanish note of Feb. 6 signed by Señor Gimeno was a well-worded protest against German methods with neutral rights. But the prime minister was too shrewd a politician not to realize that this firmness meant nothing unless backed with the will to fight if necessary, and that public opinion would not follow him so far. He therefore resolved to leave the Government there and then, at the top of the wave of his own policy.

Other considerations of home policy were perhaps not altogether without effect on his decision. A dangerous social-political upheaval was taking place under his eyes. In March and April, a serious strike situation developed in Madrid and Valladolid, which necessitated this second town being declared in a state of siege. In Barcelona, a military conflict, which was fundamentally to alter Spanish politics for years to come, was beginning to make itself felt. When on April 20 Count Romanones resigned, he took the easiest path. His fall, however, cost him the leadership of his party, the majority of which, somewhat frightened at his bold foreign policy, turned towards Señor García Prieto, while Señor Alba consolidated a separate group. The new Ministry, under the premiership of Señor García Prieto, was

frankly neutralist, and Germany rightly interpreting the position felt free to intensify its submarine campaign. But the Government had to concentrate on a far graver problem, the situation created by the so-called Committees of Defence. The artillery and engineer officers had been organized for years past into a Committee of Defence, the main object of which had been the maintenance of certain standards of professional honour and of certain rules of comradeship as to promotions, etc. The infantry officers had no such organization, their *esprit de corps* being less developed. But towards the middle of 1916, a system of infantry Committees of Defence had appeared, which soon evinced a tendency to claim authority over the army, and to interfere with the Government in such a manner that towards the end of the year, Count Romanones, then in office, insisted on their dissolution. Despite the reassuring reports of Gen. Alfau, Capt.-General of Barcelona, the headquarters of the organization, the system continued, a situation which was not altogether unconnected with Count Romanones' eagerness to resign in April 1917. General Aguilera, the War Secretary in Señor García Prieto's administration which then took office, was frankly averse to the Committees, and ordered the leaders to be arrested. A reserve Junta had been prepared, which stepped into the shoes of the arrested officers, and the conflict was only aggravated. General Alfau was dismissed and General Marina sent in his stead. But meanwhile, probably owing to royal hints, a less disciplinarian line of action was taken, and the arrested men were released. It was known later that an ultimatum had been placed in the hands of Gen. Marina, with a time-limit of 12 hours (June 1). Not unnaturally, the Government resigned. Count Romanones having refused to support any Liberal situation which would recognize the Committees, Señor Dato was called to office, and on June 9 the Liberal party ended a short spell of office during which its disintegration had rapidly advanced. Señor Dato's Government capitulated before the Juntas and accepted their regulations in full.

This victory of a movement which, in its essence, was revolutionary, had an immense effect on immediate events as well as on the political evolution of the country. The revolutionary ferment was stimulated. A state of excitement and hope—due to the plausible, high-spirited language of the Juntas—spread over the revolutionary Left. The more responsible elements of advanced politics thought it necessary to give a lead to this popular spirit. Political manifestos asking for a renovation in Government and Constitution followed each other (Socialists June 12, Catalanists June 16, Left-Coalition June 16). All but three of the deputies and senators for Catalonia met on July 5 at Barcelona, and passed a resolution asking for an immediate meeting of the Cortes, and declaring that, should the Government refuse to comply with this request, a meeting of all the deputies and senators composing the Cortes would be called at Barcelona on July 10. The Government refused to recognize the right of the Catalan representatives to dictate its policy, and made it known that should the Assembly meet on the 10th it would be considered as rebellious and treated as such. The Assembly met, 13 senators and 55 deputies attending, including all the Socialist Republican and Reformist members of the Cortes, and, before the Civil Governor dissolved it by (formally) arresting one by one all its members, it voted conclusions asking for a reform of the Constitution, and set up three commissions to prepare reports on reforms to be submitted to a second meeting to take place later. At one moment, it looked as if these 68 men would take the lead of the revolutionary spirit which the bold action of the army officers had stirred in the country. But the mass of the Assembly was too dull, and no real leader manifested himself in it. Thus two attempts, one military, one middle-class, both directed against the evils of the old régime, failed through lack of coordination and mutual understanding. A third attempt, and a third failure, was still to come. On Aug. 2 the railwaymen of the Northern railway announced a strike. Though at first the men appeared desirous of a settlement, neither the Government nor the company succeeded in

Resignation of Romanones.

Dato Again Prime Minister.

Social-Political Upheaval.

avoiding the strike, which began on the 10th. On the 12th, a general strike was suddenly launched in the whole country. It was clearly revolutionary, and aimed at the overthrow of the monarchical system and its replacement by a more or less socialistic republic. The country was declared in a state of war. Riots of a grave character took place in nearly every important town and industrial district of the country, and the military, which had been entrusted with the situation, crushed the rebellion with a ruthless hand. This revolutionary onslaught was somewhat aimless and impulsive, yet the period of street fighting lasted a whole week. By Aug. 9 the situation was well in hand. The net result was to prove that the only real force in the country was the Army Committee system.

On Aug. 10, the Council of Ministers passed a special credit for military expenses, implying an extension and renovation of several important services. The Juntas, conscious of their strength, encroached further and further upon the administration of the War Office, and even asserted themselves in the field of civil politics.

*The
General
Strike.*

Their first victim was Marshal Primo de Rivera, whom they practically forced to leave the War Office. Then the scandal became public, on the Government having lifted the censorship. The Committees attempted to deliver a message into the hands of the King, and a period of intense political excitement ended in the fall of Señor Dato, who had to resign on a "perfectly constitutional" hint by the King. In point of fact Señor Dato was expelled by the Army Committees. The crisis was long and laborious, and in the midst of it, the Parliamentary Assembly met in Madrid (Oct. 30) in order to hear the reports prepared by the three commissions appointed in its first sitting. Speeches were pronounced by Señor Cambó and Señor Alvarez, which were addressed rather to the King, than in consultation with political leaders, than to the Assembly. Both leaders declared that they would not accept office in a Government which would not be ready to adopt the conclusions of the Assembly, involving some democratic changes in the Constitution. But while Señor Alvarez held fast by this declaration, Señor Cambó

*García
Prieto
Coalition
Govern-
ment.*

allowed two of his followers to enter the Cabinet which was at last formed by Señor García Prieto. This Cabinet was a Coalition ministry in which, in order to give satisfaction to the new demand for an impartial general election, a non-political judge was given the post of Home Secretary. It was composed of Maurists, Liberals and Catalanists. Señor La Cierva, who took the War Office, was the real head of the Cabinet. His policy consisted in ingratiating himself with the Committees of Defence, so as to become their leader and representative.

An incident which occurred early in the year (Jan. 3) showed the extent to which the revolutionary action of the Juntas had affected the army. The N.C.O.'s, it was suddenly found out, had formed a Committee of Defence and were threatening to take action unless their claims were satisfied. Señor La Cierva had no difficulty in applying to them, with the blessing of the Officers' Committees, those drastic measures which the Officers' Committees had themselves deserved. Nor was the system of Committees of Defence limited to the army. Juntas were soon formed by the civil servants of nearly all Government departments, and on Jan. 12 1918, on the occasion of a difference between the Postmaster-General and his subordinates, an agitation began which was ultimately to cause the downfall of the Government. On Feb. 21 the telegraph officers went on strike — by meticulously carrying out official regulations.

On Feb. 24 the general election took place in these abnormal conditions. For the first time a Coalition Government pre-aided over an election, and great hopes were entertained as to the result. The new Chamber, however, was but an average of the preceding ones, different only in that no party in it had a clear majority. Señor La Cierva began then to act as the self-appointed leader of the Committees. He first provoked a crisis (Feb. 27) so as to get rid of his Catalanist colleagues, Señores Ventosa and

Rodés, who would have been obstacles to his plans, and having accepted their replacement by two second-rank men he faced the Government with a demand that a programme of extensive military reform be enacted by Royal Decree, without submitting it to Parliament. This provoked a second crisis, Señor Gimeno, Count Romanones' representative in the Cabinet, having stood firm against such an insult to Parliament. The crisis, however, was settled on the secret understanding that the decree would be granted while Señor La Cierva would negotiate the self-dissolution of the Juntas. Then the conflict was suddenly aggravated on its civil side, the Government having decided to be as firm with the civil Juntas as it had been weak with the military ones. At the instigation of Señor La Cierva, the telegraphs were put under War Office authority and all civil Juntas were declared officially dissolved (March 14), while Señor La Cierva obtained from the military officers an apparent submission under the form of a reduction of their own Juntas to the status of "Committees of Technical Studies." On Feb. 17 the postal services declared a strike. Señor La Cierva's efforts to cope with this by means of military improvisations ended in utter failure, and at the very first sitting of the Cortes (March 18) the Government fell. All possible combinations were tried and failed, until on March 21 at midnight, at a meeting of ex-prime ministers called by the King in his study, after, it is said, having threatened his abdication, King Alfonso succeeded in forming a "ministry of all the talents," composed as follows: Maura (Premier), Dato (Foreign Office), Besada (Finances), Cambó (Public Works), Alba (Education), Marina (War), Pidal (Navy). The solution given to the crisis produced an outburst of popular enthusiasm due mostly to the downfall of Señor La Cierva. This Government had agreed on a concrete programme: reform of the standing rules of the Cortes, amnesty, military reforms, budget. The Government carried them all but the fourth, Señor Alba having left the Cabinet on their refusal to pass his education plans (Oct. 8), which ultimately brought the Cabinet to its end on Nov. 6.

*Ministry
of "All the
Talents."*

The new Government had to be formed amid the sensation caused by the arrival in Madrid of the news of the Kaiser's flight, and great changes were expected as the result of this. The Reformists having refused to cooperate on the conditions offered them, the changes were limited to the appointment of a Liberal Ministry, on Nov. 9, with Señor García Prieto as prime minister. The world being full of the idea that the triumph of the Allies meant that of democracy, the Government published an "advanced" manifesto. Other signs of the *Zeugst* were a bold Land Bill, introduced by Señor Alba, a series of telegrams of congratulations sent by King Alfonso to all the Allied chiefs of state, a meeting of the Conservative party, where a reform of the Constitution was seriously mooted, the waiving by the Government of their right to appoint the Mayor of Madrid, and a revival of the Catalanist question as manifested in a message to the Government addressed by the *Mancomunidad*. This last message produced a split in the Cabinet, Count Romanones, its Foreign Secretary, being in favour of Home Rule. The ministry thus fell on Dec. 3 1918, and it was decided that Count Romanones would form a stop-gap cabinet so as to pass the budget and leave the King free for a change of policy. The first important act of Count Romanones was his visit to President Wilson, then in Paris.

nones
Ministry.*

It is clear that from the middle of 1917 on, home problems occupied the Spanish mind more than the war. The incidents of the submarine campaign had to be handled by Governments which knew the country to be resolved not to fight, divided as to its sympathies, and rent by revolutionary and constitutional crises. It is to the credit of the successive Governments which ruled Spain during this period that they succeeded in steering clear of all obstacles, home and foreign, overburdened as they were with home problems and foreign advice not always disinterested. On June 29 1917 a German submarine, "UC52," arrived in Cadiz for repairs. Señor Dato allowed its arrival and

*Señor La
Cierva and
the Com-
mittees.*

departure within 24 hours, and thereupon had a Royal Decree signed forbidding submarine navigation in Spanish waters. The next incident of the kind was the escape of "U 53," which had been interned in Cadiz under the above Royal Decree. The escape appears to have been due to an excessive amount of trust in the German commander on the part of the Spanish naval authorities, whom the Government promptly deprived of their commands. On the initiative of the Romanones administration a treaty had been negotiated in London between the Marqués de Cortina and the English Government. This agreement was signed on Dec. 6. Its importance consisted in that it legalized, in the eyes of the pro-Germans, all trade with England, which received food and ore in exchange for coal. Torpedos continued all the same, and the Spanish Government sent strongly worded notes on the sinking of the s.s. "Giralda" and the s.s. "Duc de Génova" (1918). The s.s. "Larrinaga" was torpedoed while conveying petrol from New York to Santander, on a Government charter (July 25 1918), and thereupon the Spanish Government, alarmed at the heavy losses sustained by the merchant marine, decided to apply to Germany the claim of ton for ton. This was the high-water mark of anti-submarine methods adopted by the Spanish Government. Germany had agreed to the ton-for-ton indemnity when the end of the war came. The Spanish merchant marine had lost 65 ships representing 140,000 tons.

From the material point of view, the neutral attitude adopted by Spain contributed to accelerate the progress which was observable in her economics in the pre-war years. This period of exceptional activity comprises two coincident movements. One is a somewhat artificial "inflation" of Spanish industries, due to the demand of the Allies. The other one is the mere continuation of a development already noticeable before the war. Thus certain industries, really national, such as that of olive oil, succeeded at last in establishing themselves in foreign markets. The effect of the war on the country was therefore neither altogether bad nor altogether good. While it served to stimulate a progress which had already set in, it also created artificial conditions which contributed much to social unrest by flooding the country with money too easily earned.

Count Romanones did not precisely find in Paris in 1910 the diplomatic triumph which he had expected, but neither did he return wholly disappointed. He brought back a seat in the Council of the League of Nations for Spain. He found the country astrid with a mixture of two political currents, one a democratic, constitutional agitation, born of the Allied victory, another one a revolutionary agitation which could be traced to the unwholesome effect of the Juntas' *pronunciamientos*. The main effect of these two movements was felt in Barcelona, and was represented by Catalanist propaganda, a military undercurrent of opposition to it, and lastly a syndicalist agitation which made the two former forget their mutual enmity and unite against it. Two sets of events suddenly revealed the power of the syndicalist agitation: a general strike which paralysed the whole life of the town, and a series of murders of employers. The Government played with two policies. It militarized the strikers, then tried to conciliate them by sending to Barcelona three liberal-minded civil authorities—Señor Morote, Señor Montañés (Civil Governor) and Señor Doval (Chief of Police). A violent conflict arose between the military and the civil authorities, and when the strike had been settled by the latter, the Government suddenly resigned. It was known afterwards that this resignation was due to the military having expelled the civil authorities from the town. Señor Maura took office on April 15, asked for a decree dissolving the Cortes, and to the consternation of all parties, obtained it. This amounted almost to a *coup d'état* on the part of the King. After a general election held under a strict censorship, under the protest of all the Left parties (including the Monarchical Liberals), and with the use of electioneering methods which had fortunately been long forgotten in Spain, Señor Maura failed to

bring to the new Cortes more than about one-eighth of its total membership under his banner. His Government fell scandalously under a discussion of his electioneering methods (July 15), and Señor Sánchez de Toca (Señor Dato being ill), formed a Conservative Cabinet, which had to deal with a grave situation in Barcelona, where syndicalist trouble was again brewing. But a new outburst of the Juntas forced the Government to resign, and Señor Allendesalazar (a follower of Señor Maura) took office with a Coalition Cabinet. The change of policy which the change of Cabinet implied determined an aggravation of the conflict. Murders continued. A mutiny organized by syndicalist soldiers took place in a barracks in Saragossa. Disorders broke out in Valencia and Santander. Another military outburst, the publication of secret letters by Gen. Milans del Bosch (Capt.-General of Catalonia) and the subsequent dismissal of that officer by the Government, which in its turn caused the resignation of Señor Gimeno, imposed by the military, ended the life of the Cabinet, which, having passed the Budget, left office on March 4 1920. Two schools of thought manifested themselves then: one favourable to occasional coalitions, taking office in order to carry out definite programmes, another one favouring the reconstruction of the old system of two rotating parties. The King favoured this second school, represented by Señor Dato and Señor García Prieto, and the former was called to power. But the general election which he called forth at the end of 1920 showed that the main-spring of that old system—i.e. the docility of the electorate to any kind of government—could no longer be counted upon. Señor Dato failed to obtain a working majority, his supporters numbering 177 members out of 405. All his efforts were accordingly bent towards the reconciliation of the several factions within the Conservative party. While engaged in this task he was assassinated by anarchists on March 8 1921.

Conservative Cabinet under Sánchez de Toca.

Dato Prime Minister.

SPANISH LITERATURE

The dominant feature of Spanish contemporary literature in 1910-21 may be found in an effort to achieve the fusion of the critical with the creative element in the race (see S. de Madariaga, "Introduction to Spanish Contemporary Literature," *London Mercury*, Sept. 1920). With the death of Galdós, the sceptre of Spanish literature falls on Miguel de Unamuno (b. Bilboa, 1864), a professor of Greek in the university of Salamanca, a voracious reader, familiar with all European, American and classical literature, and an indefatigable writer. Unamuno represents the modern version of the Spanish mystic writer. His main concern is the relation of man to creation. It is the subject of his masterpiece *El Sentimiento Trágico de la Vida*, a book of passionate meditation, and, at any rate as an attitude of mind, it dominates his criticism (*En torno al Casticismo, Ensayos*), his novels (*Abel Sánchez, Tres Novelas y un Prólogo*) and his plays (*Fedra*). In these works Unamuno appears as the apostle of an ideal of life more closely connected with spiritual Easternism than with the intellectual and social tenets of the West. He thus fulfils in Spain much the same function which Dostoevsky held in Russia, for Spain, like Russia, stands as a transition between East and West. His ideal is in intensity rather than in extension, in individual achievement, the saving of one's soul, rather than in social work and collective material progress. His style corresponds to his beliefs. It reminds one of Carlyle's in that it is written with the whole man's being, body and soul, but it is never eloquent and rhetorical; rather does it tend to conversational familiarity and evinces now and then a proclivity towards being led to new thoughts by the mere shuffling of words.

Should we care to complete the parallel with Russia by finding a Spanish westerner to oppose to Unamuno, as Turgenev stands to Dostoevsky, a younger man than the Basque master, José Ortega y Gasset (b. 1883), would have to be mentioned. A professor of Philosophy at the university of Madrid, Señor Ortega y Gasset is a refined humanist, strongly influenced by German contemporary neo-Kantian schools of thought. His style is naturally polished and his mind penetrating and acute.

Troubles in Barcelona.

Fall of Romanones Government.

His main work is in the field of criticism and psychology (*Meditaciones del Quijote*, *El Espectador*). To this same school may be ascribed José Martínez Ruiz (b. 1876), better known under his literary name as "Azorín." His art has all the finish and exquisiteness, all the smallness also, of miniature-painting. He has had the rare merit of applying it to the interpretation of national scenes and places (*Castilla*, *Los Pueblos*), and has thus contributed in no small measure to the movement for national self-knowledge which is noticeable in contemporary Spain.

In fiction, though belonging to an older generation, Vicente Blasco Ibáñez (b. 1866) must be mentioned, since he continued to wield a never-idle pen. His creative vigour was unabated. His war novel, *Los Cuatro Jinetes del Apocalipsis*, made him famous with the English-speaking public. Older novels have been translated, such as *Sangre y Arena* (as *The Matador*) and *La Barraca* (as *The Cabin*). Blasco Ibáñez represents a kind of art which is Spanish only in its subject, but not in its spirit, manner or style. He is more closely related to the French naturalist school than to any Spanish literary tradition. Of a younger generation, Pío Baroja (b. 1872) is perhaps the most widely read. A Basque, with all the acuity of mind of his race and not a little of its rustic independence and antagonism to civilization, Baroja writes abundantly and carelessly, with more spirit than art. He is more capable of rendering with remarkable accuracy separate aspects of truth than of weaving them into an organic unity endowed with life. His best work is perhaps *Idilios Vascos*, where he has rendered the quaint charm of his own country. Ramón Pérez de Ayala (b. 1881), a critic of great talent, has written several novels, the best of which are *Novelas Poéticas* and *Belarmino y Apolonio*.

Jarinto Benavente (b. 1866) is still the dominating figure of the Spanish theatre. His most famous play, *Los Intereses creados* (1907), is not representative, for it illustrates but one phase of the talent of this many-sided author. A more powerful tragedy, *La Noche del Sábado*, is of the same period. In more recent times he has given an intense drama of love in *La Malquerida*. There is, however, a type of play in which Benavente must yield the prize to the brothers Álvarez Quintero (Serafin, b. 1871; Joaquín, b. 1873). As authors of *Comedias de Costumbres* these two writers, who always work together, are unsurpassed. The list of their comedies is long (*Las de Cami*, *Puebla de las Mujeres*). Other playwrights of note are Linares Rivas (b. 1866), remarkable for his skill in the handling of dialogue; Martínez Sierra (b. 1881), a delicate psychologist, and Pinillos ("Parmeno," b. 1875), a vigorous painter of social conflicts. But drama and comedy are but one, and not the more important, aspect of the Spanish theatre. Still more typical of the nation is what is modestly known in Spain as *género chico* (small genre), a full growth of theatrical production, generally short and accompanied with music, and ranging from variety pieces akin to operettas to little masterpieces of musical drama. Its best-known exponents are the brothers Quintero and Carlos Arniches (b. Alicante, 1866).

The two main currents which influenced Spanish poetry towards the close of the 19th century, i.e. the national tradition and the symbolist school of France, more or less interpreted by South American poets, such as Rubén Darío (b. 1867), remained still observable up to 1920, though the first was more vigorous and conscious, the second widened so as to include all influences, from those of d'Annunzio to those of Maeterlinck and even Rabindranath Tagore. As more typically national, we shall mention Miguel de Unamuno (*Rosario de Sonetos Líricos*, *El Cristo de Veldasques*), strong and somewhat unharmonious, but true and austere; Antonio Machado (b. 1875) (*Soledades*, *Campus de Castilla*), whose pessimistic serenity is in keeping with the landscape of central Spain which inspires his poems; and Salvador de Madariaga (b. 1886), whose *Romances de Ciego* restate, in a new spirit, the old Spanish theme of Jorge Manrique. Other poets appear under more complex influences. Thus Manuel Machado (b. 1874), whose main inspiration is popular and southern, has, however, written excellent verse in which the influence of French elegant sensibility is discernible. Juan Ramón Jiménez

(b. 1881), more remarkable for his exquisite sensibility than for his power (*Arias Tristes*, *Eleotas*), is led by his melancholy moods towards fluid rhythms which, though more subtle, remind one of Maeterlinck and, through him, of Rossetti. Ramón del Valle Inclán (b. 1870), perhaps the most skilful musician amongst modern Spanish poets, has given in *La Marquesa Rosalinda* an admirable example of the adaptability of the Spanish language to the most refined rhythms. Ramón Pérez de Ayala (b. 1881), in *El Sendero Innumerable*, succeeds in effecting a happy wedding of thought with harmonious poetry, in a work not wholly uninfluenced by Francis Jammes, d'Annunzio and Walt Whitman.

Among historians of literature the work of Marcelino Menéndez y Pelayo is continued by D. Ramón Menéndez Pidal (b. 1869), whose works on the Poem of Myo Cid and on the Spanish chronicles have thrown great light on the origins of Spanish epic poetry. Francisco Rodríguez Marín (b. 1855), the editor of *Don Quixote*, a specialist in Spanish folklore, has succeeded the master as head of the National Library. In the younger generation, Federico de Onís (b. 1885) has edited Fr. Luis de León, and Américo Castro (b. 1885) has worked on Lope de Vega.

Journalism, always a great art in Spain, where the paper is infinitely more read than the book, is cultivated by all writers, and every one of the names quoted above might be quoted here again as a journalist. Mention must be made, however, of two eminent contemporary writers whose work is almost exclusively journalistic—Ramiro de Maeztu (b. 1874), a versatile mind whose educating influence on the Spanish reading public has been incalculable; and Luis Araquistain, a powerful dialectician and a master of the polemic style. (S. DE M.)

SPECTROSCOPY (see 25.610).—As developed in more recent years (1910–21) the science of spectroscopy has for one of its chief purposes the analysis of spectra, and the deduction therefrom of the nature of the atoms and molecules which generate the spectra. The progress which has been made in this connexion has depended upon improved determinations of the wave-lengths of spectral lines, the further investigation of the varying spectrum of the same substance when excited to luminosity in different ways, the more complete analysis of certain spectra into regular series systems, and, finally, on theoretical investigations. In another direction, important advances have been made in the interpretation of the spectra of the various classes of celestial bodies, which may be regarded physically as experiments on large masses of matter at various high temperatures.

Standards of Wave-Length.—Extensive interferometer determinations of wave-lengths in the arc spectrum of iron, based upon 6438.4696 "international" angstroms for the red cadmium line, have been made by K. Burns¹ and others, which provide valuable standards for the general determination of wave-lengths by interpolation. It has been found, however, that the wave-lengths of many lines differ considerably in different parts of the arc, so that special precautions are necessary in order to obtain comparison spectra in agreement with the tabulated standards. Probably the most accurate set of standards are those given by St. John and Balcock,² who used a small central zone of a "Pfund" iron arc operated between 110 and 250 volts, with five amperes or less, at a length of 12 mm. This list contains 1026 lines, from 23370 to 26750, and for most of them the wave-lengths are believed to be accurate to 0.001 angstrom.

Flame, Arc and Spark Spectra.—The range of spectroscopic research has been almost indefinitely extended by the discovery that in nearly all cases the same substance yields different spectra when stimulated in different ways. Such differences are of little importance from the point of view of chemical analysis, but they have become of great significance to the physicist, and have also greatly aided in the interpretation of the spectra of celestial bodies.

The three typical methods of producing luminosity for the observation of the spectra of metallic elements or their salts are the flame, the electric arc and the electric spark. As a general rule, the three sources exhibit important differences. In the flame the lines are comparatively few in number; in the arc the flame lines remain prominent, but many more lines, including some which are as strong as the flame lines, make their appearance. In the spark, there is a tendency for many of the typical arc lines to disappear, whilst other lines may be much intensified, and entirely new lines may also be present. The important class of lines which are intensified, or which only appear, under the violent action of the condensed spark were

¹ *Lack Obs. Bull.*, No. 247 (1913); *Zell. f. Wiss. Phot.* xii, 209.

² *Astrophys. Jour.* liii, 260 (1920).

designated *enhanced lines* by Sir Norman Lockyer, and this name has been generally adopted. The different classes of lines are thus commonly known as flame, arc, and spark (or enhanced) lines, according to their relative prominence in these three sources. This classification, however, is in some respects imperfect, and more definite designations will doubtless eventually be based upon the theoretical considerations to which reference will be made later.

There are many possible variations of these experimental methods of producing spectra, but it would seem that the equivalent of one or other of the three typical sources, or of some intermediate stage, is almost invariably obtained. A more detailed temperature classification of the lines has been based upon experiments with the electric furnace by King,¹ but the terms flame, arc and spark lines suffice for most purposes of description.

Similar variations have also been observed in the spectra of gases when submitted to the action of discharges of varying intensity, and the different classes of lines are sometimes distinguished by analogy as arc and spark lines, although with few exceptions the arc is not actually employed. Independent justification for these names, however, is found in the fact that the arc spectra of some gases can be directly observed. The primary and secondary spectra of hydrogen, for example, have both been observed in the arc,² and some of the principal series lines of oxygen have also been observed in the spectra of metallic arcs in ordinary air.³ The actual spectrum given by a gas depends upon its pressure as well as upon the intensity of the discharge by which it is made luminous. Generally speaking, the greater the pressure of the gas, the greater will be the strength of the discharge required to produce the "spark" lines.

One important aim of modern spectroscopic research has been to search for an explanation of these phenomena, for it cannot be doubted that the causes of the variations in the spectra are intimately connected with atomic structure. In this connexion it will be instructive to refer first to the spectra of known compounds. There are many compounds which can be excited to luminosity without total decomposition,⁴ and it has been found that each compound gives a characteristic spectrum by which it can be identified as such. These spectra invariably consist of bands, and different sets of bands characterize, for example, the oxides, chlorides and fluorides of the alkali earth elements.

It is sufficiently obvious that if a compound be stimulated so strongly that it becomes dissociated, the spectrum will change from one consisting of bands representative of the compound to one containing the lines of the constituent elements. It is not only compounds, however, that show changes of this character. Experiments on nitrogen, for instance, show a range of spectra from one consisting wholly of bands to one in which lines occur alone. Even hydrogen has two spectra: (1) the highly complex, so-called secondary spectrum, which doubtless represents a banded spectrum of rather coarse structure;⁵ and (2) the familiar line spectrum, constituting the Balmer series. Similar results have been obtained for many other elements, and from analogy with the spectra of compounds the natural conclusion is that the band spectra of the elements arise from molecules, while the line spectra are produced by the atoms which are set free when the molecules are dissociated.

If this be a true view, the change in the structure of the atom, or in its mode of vibration, which accompanies the successive modifications of the line spectrum becomes a question of paramount interest. Lockyer⁶ did not hesitate to believe that while the arc lines of an element were to be attributed to ordinary atoms, the enhanced lines could only be produced by the splitting-up of the atoms themselves, and he called these simpler forms of matter the proto-elements. Proto-calcium, for instance, denoted calcium which had been broken up into sub-atoms by the application of a sufficient stimulus. A somewhat similar, but more probable, explanation has been based upon an application of the quantum theory by Bohr to Rutherford's nucleus theory of the atom. This theory is founded largely on the analysis of spectra into regular series.⁷

Range of Observations.—For the complete determination of the laws of spectra it is necessary to extend the observations far beyond the limits of the visible spectrum. Conspicuous success in the direct photography of the near infra-red spectrum has been achieved by Meggers and others, by the use of ordinary plates stained with dicyanin.⁸ By this method excellent photographs of the arc spectra of a large number of elements, extending to 110,000, have been obtained with a concave grating, and the positions of the lines have been measured with a high degree of accuracy. For the present,

the extreme infra-red can only be investigated by thermal effects, involving the use of the thermopile, bolometer, or radio-micrometer, as in the researches of Paschen, Lehmann, and Randall.

Spectroscopic observations in the direction of the ultra-violet, beyond the limit about 11850 set by the absorption of quartz, and beyond about 17000 set by the absorption of air, which were first made by Victor Schumann, have been greatly extended by the use of concave gratings, and wave lengths of considerable accuracy have been determined. Lyman has recorded lines as far as 1500 angstroms, and in similar work at Toronto, McLennan has observed a line attributed to carbon at 1584. A still greater extension has been made at Chicago by Milikan⁹ and his colleagues, who have observed lines of nickel as far as 1202. Several improvements in technique were necessary to this success. It was achieved, in the first place, by using gratings specially adapted for the purpose; secondly, by working in an essentially perfect vacuum, through the use of powerful pumps, and finally, since no ordinary spark could pass in a vacuum, by the use of a specially strong sparking apparatus which was capable of forcing a discharge across a very small space between the electrodes. Such a spark was found to produce the extremely short X-rays in the case of carbon, so that the gap which had previously existed between ordinary light waves and X-rays was for the first time bridged.

Spectroscopic data thus cover a very wide range, and offer many interesting problems to the investigator. Their solution depends on his ability to make a true analysis of spectra, and to deduce therefrom the corresponding atomic or molecular conditions.

Analysis of Spectra.—Considerable progress has been made in the analysis of spectra into series. One of the most important advances in this direction is the increased knowledge of the primary spectrum of hydrogen, which is now known to contain, not only the Balmer series, but also two similar series, one in the infra-red and the other in the far ultra-violet. The former was discovered by Paschen, and the latter, previously predicted by theory, was found by Lyman with his vacuum spectrograph. Each of these series is well represented by a mathematical formula, which is simplified if the lines are expressed by their "wave-numbers" (ν) instead of their wave-lengths. The wave-number is the number of waves per centimetre *in vacuo*, and is proportional to the frequency of the vibration. In practice, it is obtained by dividing the wave-length (in angstrom units), connected to a vacuum, into 10^8 . In these terms, the formulae for the hydrogen series are as follows:—

$$\text{Lyman series } \nu = \frac{N}{1^2} - \frac{N}{m^2} \quad (m=2, 3, \dots)$$

$$\text{Balmer series } \nu = \frac{N}{2^2} - \frac{N}{m^2} \quad (m=3, 4, \dots)$$

$$\text{Paschen series } \nu = \frac{N}{3^2} - \frac{N}{m^2} \quad (m=4, 5, \dots)$$

Thus, a general formula for the primary hydrogen spectrum, which

might include other undiscovered series, would be $\nu = \frac{N}{m_1^2} - \frac{N}{m_2^2}$.

N is a constant, whose value is 109678.3. m is a constant integer for any one series, and m_2 has a different integral value for each line of a series. R. W. Wood¹⁰ has recently extended the Balmer series to $m=22$, i.e. to 20 lines, by experiments with long vacuum tubes. In the spectrum of the sun's chromosphere, 34 lines of the series have been recorded.

There is only one other known spectrum which has the same simplicity as that of hydrogen—namely, the enhanced spectrum of helium. This includes the series first found by Pickering in the star ϵ Puppis, and the line $\lambda 4686$ and others calculated by Rydberg, by whom both series were attributed to hydrogen. These lines were produced in the laboratory by Fowler,¹¹ and additional lines of the Pickering series, first indicated by Bohr's theory, were afterwards observed by Evans¹² and by Paschen.¹³ It was, in fact, the theoretical work of Bohr which first suggested that the lines in question originated in helium and not in hydrogen.

The enhanced series of helium can be represented by a formula similar to that for hydrogen, with the difference that the series constant has rather more than four times the value for hydrogen.

Thus, the series which includes $\lambda 4686$ is given by $\nu = 4N' \left(\frac{1}{3^2} - \frac{1}{m^2} \right)$

when N' is 109723. The complete Pickering series is given by substituting $1/4^2$ for $1/3^2$ in this formula, and a further series calculated by the use of $1/2^2$ has been partially observed by Lyman. It should be noted that alternate lines of the Pickering series are nearly coincident with the Balmer series of hydrogen.

Other spectra exhibit several series superposed. The three types of series early recognized as occurring in the same spectrum were denoted by Schuster as the "Trunk," "Main Branch," and "Side Branch" series, but these names are now entirely superseded by the titles "Principal," "Sharp," and "Diffuse," originally assigned by Rydberg. A fourth type of series, called the "Fundamental" or "Bergmann" series, has since been recognized. The four chief types are closely interrelated, but apparently have a certain measure of independence. Each series may consist of singlets, doublets, or triplets.

In each series the lines converge to a definite limit, and their wave-numbers are obtained by subtracting a sequence of "terms" from the wave-number of the limit. The formulae for series in general, however, are not known with the same accuracy as for hydrogen and enhanced helium. In some spectra, notably the arc spectra of the alkali metals, a close approximation to a series is given by such a formula as that of Hicks,¹ namely, $\nu = A - N/(m + \mu + a/m)^2$, where N has nearly the same value as for hydrogen, while μ and a are constants and A is the limit of the series, as before m takes successive integral values. In some series, however, such a formula by no means gives an accurate representation of the observed lines. All that the theoretical investigator can accept with confidence at present is that the general term formula is $N/[f(m)]^2$, where $f(m)$ is a function of m whose form is known only for hydrogen and enhanced helium.

The four main sequences of terms are denoted, for brevity, by the symbols mP , mS , mD , mF , where different integral values of m correspond to the different terms in each sequence. The limit of each of the four series is the first term of one of the others, so that in the abbreviated notation, we have:—

Principal series	$= 1S - mP$
Sharp series	$= 1P - mS$
Diffuse series	$= 1P - mD$
Fundamental series	$= 2D - mF$

The term $1P$ has one, two, or three values, according as the series consists of singlets, doublets, or triplets; and, similarly, the term $2D$ has two or three values, in doublet and triplet series respectively, when satellites are present in the diffuse series.

It was first shown by Ritz, and expressed in his "combination principle," that lines often occur in positions corresponding to other differences of terms besides those giving the four main series. Thus, there may be a series $2S - mP$, $1P - mP$, and so on. Many lines not previously included have in this way been proved to form part of general series systems.

The recognition of the importance of "terms" is a definite step towards the simplification of spectra, since the number of terms is less than the number of lines included in the series and combinations. Moreover, theoretical investigations indicate that the terms have a more immediate physical significance than the lines themselves. On this account, it is of great interest to construct a "term-spectrum," in which the terms, instead of the lines, are plotted along a horizontal scale. Such a term-spectrum—for the element lithium—is shown in the appended diagram. For economy of space, the terms are represented horizontally by their logarithms instead of their actual values.

In the term-spectrum diagram, the four main sequences are distinguished by the varying heights of the strokes by which their terms are represented. The highest principal term ($1P$) minus the sets of sharp and diffuse terms, gives the sharp and diffuse series of lines respectively, while the highest sharp term ($1S$) minus the set of principal terms, and the highest diffuse term ($2D$) minus the set of fundamental terms, give the principal and fundamental series. These four series are generally well developed, but, as already remarked, other combinations often arise. It appears, however, that all the combinations which are mathematically possible do not occur with the same frequency.

Origin of Spectra.—The theory of Bohr,² which has already been mentioned, offers a remarkably accurate explanation of the spectra of hydrogen and enhanced helium, and gives a physical meaning to the terms which has proved very fruitful in suggesting new direc-

tions of research. According to this theory, the atom of an element consists of a positively charged nucleus surrounded by an appropriate system of electrons, such that the total negative charge of the electrons is equal to the positive charge of the nucleus. Nearly the whole of the mass of the atom is concentrated in the nucleus, which is very small in comparison with the distances separating it from the electrons. When an electron is removed from its normal position by the application of an external stimulus, it may traverse temporarily one or another of certain orbits determined by quantum considerations. In each of these orbits it has a certain amount of energy, which is assumed to remain constant while the electron revolves in the orbit. The terms of the spectrum are then taken to be proportional to the respective amounts of energy. When the electron returns to its normal position, it comes to an orbit in which, for equilibrium, it must possess less energy than it had in the temporary orbit. The difference of energy, which is proportional to the difference of the corresponding terms, is emitted as a homogeneous radiation, and gives rise to a definite spectral line, while, if the electron occupies successively different orbits on its return, several lines will be produced in succession. The actual spectrum at any moment is the summation of the different lines yielded by atoms in different states. The term spectrum can thus be regarded as a diagram of the atom, in which the nucleus is at the zero of the scale (to the right in the diagram), and the strokes are parts of the possible orbits. A spectrum line appears when an electron passes from one orbit to another on its return towards its normal position in the innermost orbit.

The differences between the arc and enhanced spectra receive a simple explanation on the Bohr theory. The lines of an arc spectrum are supposed to be generated by the disturbance of a single electron and its subsequent interaction with the nucleus and remaining electrons. When two electrons are removed from their normal positions, and one remains at a great distance, the return of the second electron generates an entirely different spectrum consisting of the enhanced lines. An atom which has lost one or more electrons is said to be "ionized."

Assuming the hydrogen atom to consist of a nucleus and a single electron, the energies of the possible orbits can be calculated, and are found to be proportional to the observed terms N/m^2 . Helium, the next lightest element to hydrogen, is believed to have two electrons, and the mathematical problem of determining their motion has not yet been solved. If one of the electrons is removed, however, the atom is similar to that of hydrogen, except that the nucleus has a double positive charge and a greater mass. The resulting enhanced terms are therefore calculable. They again have the form N/m^2 , but N has now a much larger value than it has for hydrogen.

It is represented in both cases by the expression $\frac{2\pi^2 E^2}{ch^2} \cdot \frac{mM}{m+M}$,

where e , m , and E , M , are respectively the charge and mass of the electron and nucleus, h Planck's constant and c is the velocity of light. In the case of hydrogen $E = e$, and when the experimental values of the various quantities are substituted in the formula, the series constant is reproduced with remarkable accuracy. The second factor increases with M , so that it will be slightly greater for helium than for hydrogen. Also, the double nuclear charge makes the first factor in the expression for N four times as great for enhanced helium as it is for hydrogen. These theoretical requirements have been completely verified by experiment. Fowler, calculating N for hydrogen and helium from the observed lines, used the theoretical expressions to calculate the value of M/m , i.e. the ratio of the masses of the hydrogen atom and the electron—and obtained a result in very close agreement with that arrived at by direct measurement. Moreover, he has shown³ that in the more complicated spectra of the alkali earths, the enhanced line terms are also represented by formulae in which N has four times its value for arc spectra.

It has not yet been possible to calculate the theoretical terms of other spectra, on account of the mathematical difficulties connected with the interaction of more than two bodies. The same principles, however, are believed to apply to atoms containing many electrons, and the physical conceptions of the theory have led to valuable information regarding the order of excitation of the lines under gradually increasing stimulus.

Further developments of the theory, taking into account the variation of the mass of the electron with velocity required by the theory of relativity, have indicated that the lines of the hydrogen and enhanced helium series are complex, and under high resolution should appear to consist of several components. This has been verified by Paschen,⁴ who found results for helium in remarkable agreement with the predictions of Sommerfeld. The intensities of the several components also are in the ratio calculated by Sommerfeld by a special hypothesis.

Resonance and Ionising Potentials.—Strong support for the Bohr theory is given by experiments in which atoms are bombarded by electrons, with a view to temporary disintegration. If an electron, of charge e falls through a potential difference, V , it acquires a

quantity of energy, eV , expressed in appropriate units. If such an electron bombards a neutral atom, it is found that no change takes place until v reaches a certain value, when there is a sudden radiation of energy corresponding to a particular line—usually a strong flame line—in the spectrum of the bombarded atom. According to Bohr's theory, the energy in this particular radiation is equal to $h\nu$, where ν is the wave-number of the line, and h is Planck's constant. Experiments with several elements show that this critical value of v is determined by the relation $eV = h\nu$. This means that the energy of bombardment has been just sufficient to remove the electron in the atom from its normal position to the next orbit, and, on its return, the electron restores the energy in the form of monochromatic radiation of the appropriate frequency. If v is expressed in volts, the wave-number of the emitted line is numerically equal to $v \times 8102$. The value of v when emission first takes place is known as the "resonance" or "radiation" potential. Further, by increasing v , it is possible to remove an electron from the atom altogether. If the energy, eV , in this case is equated to $h\nu$, the resulting value of ν is found to be equal to the largest term in the spectrum—usually the term 1S, the limit of the principal series. This term would correspond to the innermost orbit of the electron, and the result suggests that the energy which must be applied to remove an electron from the atom is just equal to the energy possessed by the electron when revolving in its normal position. The potential required to remove an electron from the atom is known as the "ionizing potential." It has been determined experimentally for a number of elements and has been found to be in complete agreement with the orbital energy as calculated from the largest term in the spectrum. The Bohr theory thus presents a simple picture of the processes taking place in experiments of this type.

The Stark Effect.—The resolution of spectral lines under the influence of intense magnetic fields—usually known as the Zeeman effect—has been extensively studied for a large number of elements. Somewhat similar effects, but much greater in magnitude, produced by an electric field, have been brought to light by Stark,¹ and examined in considerable detail by a number of workers. Nicholson and Merton² have shown that the Stark effect may operate to an appreciable extent in an ordinary vacuum-tube discharge, causing a broadening of the lines. Both the Zeeman and Stark effects have been treated on the basis of the Bohr theory,³ with some success.

Spectra and the Periodic Table.—Attention is being drawn more and more to the relation of the spectrum to the periodic table of the elements. While it cannot be said that the relation is known with any approach to completeness, a number of important facts have been noted which may ultimately prove of great service in the interpretation of the table. It has long been known that, when doublets or triplets occur in the spectra, the wave-number separations of their components (which are constant in the sharp and diffuse series) are approximately proportional to the squares of the atomic weights of the elements producing the spectra—so long as those elements belong to the same family group. The Zeeman effect also is generally the same for lines of corresponding series in the spectra of elements belonging to the same group. But perhaps the most comprehensive connexion of spectra with the periodic table is established by the "displacement law" of Kossel and Sommerfeld.⁴ It has been observed that the "complexity" of the lines of a series—i.e. their character as singlets, doublets or triplets—is constant throughout a group, but varies from one group to another. The displacement law states that, when an element is ionized, the enhanced series take on the same type of complexity as the arc series produced by the element to the left (i.e. in the preceding group) in the periodic table. It is assumed that electrons arrange themselves round the nucleus in rings, and that spectrum phenomena are produced by electrons in the outer ring. If the outer ring contains an odd number of electrons, the spectrum will consist of doublets, while, if the number is even, the spectrum will show triplets and singlets. In the periodic table each element contains one outer electron more than its neighbour in the preceding group, while a group consists of elements having the same number of electrons in the outer ring. It follows that the removal of an electron from an

element will make the outer ring similar to that of the immediate forerunner of the element in the table, and so make the enhanced lines of the first element of the same type of complexity as the arc lines of the second. Removal of a second electron would restore the arc type of complexity, for the number of outer electrons would again become odd or even, as the case might be. A second ionization is difficult to bring about in most cases, but with silicon it is probable that one, two, and even three electrons have been removed, step by step, thus making possible four distinct spectra. These appear to show the alternation of complexity required by the displacement law. The table above gives the types of series produced by the neutral and ionized elements of the various groups, so far as they are known at present.

The spectra of the higher groups are much more complex than those of the lower ones. Their series, if they possess any, are possibly of a different type from those with which we are familiar. The displacement law, however, suggests that, by repeated ionizations, series—and therefore terms—might be detected in such spectra, of the same kind as those of the groups of elements on the left. But since, with each successive ionization, the term constant, N , is multiplied in the ratio 1.49×10^{-6} —etc., the chief series lines might tend rapidly to approach the far ultra-violet and become difficult to observe.

Band Spectra.—Several band spectra have been studied in further detail, but it does not appear that any very fundamental advance in our knowledge of the structure of these spectra has been made. The discovery of a band spectrum of helium,⁵ however, is probably of considerable importance. It has been shown by Fowler⁶ that, while the individual bands follow the ordinary laws of band spectra, the heads of some of them are arranged in accordance with the laws of line series. In this respect the helium bands appear to be quite unique. Unlike the lines of helium, the bands have not yet been traced in any celestial source.

The Solar Spectrum.—A striking feature of continued work on the solar spectrum is the identification of a large number of faint lines with lines composing the bands of certain compounds, in addition to the band lines of carbon and cyanogen previously recognized by Rowland and Lockyer. The peculiarities of the region about the G group of Fraunhofer have been shown by Newall⁷ to be due to the absorption of the well-known hydro-carbon band A4315, and the group P has been found by Fowler and Gregory⁸ to include the strong ultra-violet band of ammonia having its maximum near A3360. In addition, the band of luminous water vapour beginning at A3064 has been found by Fowler⁹ to be present in the solar spectrum. A large number of previously unknown solar lines have thus been accounted for, and it is not improbable that the thousands of faint lines which remain unidentified may eventually be traced to other band spectra.

An interesting application of modern theories of spectra to solar problems has been made by M. N. Saha.¹⁰ On the reasonable assumption that the composition of the sun is essentially the same as that of the earth, it remains to account for the absence of spectral indications of many of the elements. Dr. Saha urges that the varying representation of different elements arises from the varying response of these elements to the solar stimulus, depending upon the structure of their atoms, and the consequent difference in their ionizing potentials. Cæsium, for example, has a low ionizing potential and is considered to be completely ionized in the sun, so that the familiar lines do not appear, while the chief lines of the ionized element are out of range. In contrast, sodium has a higher ionizing potential and is only partially ionized in the sun, so that the lines of the neutral atoms appear strongly. Other elements, such as neon and argon, have very high ionization potentials, and are not excited at all. Dr. Saha finds support for his views in calculations of the percentage ionizations of various elements at different temperatures and pressures, and it is possible that the peculiarities of the solar spectrum may be satisfactorily explained by these considerations.

Stellar Spectroscopy.—Our detailed knowledge of the spectra of the stars has been greatly advanced by the use of the large telescopes which have been erected, and considerable progress has also

been made in the interpretation of the stellar lines through experiments in the laboratory. In particular, the use of stronger discharges than had previously been employed has led to the discovery of new lines of several elements, which have been identified with the lines occurring in the hotter stars. Certain lines of the Wolf-Rayet stars, for example, have thus been traced to carbon by Merton,¹ and others to oxygen by Fowler and Brooksbank.² The general outcome of the experimental reproduction of stellar lines is to support the view that the order in which the different classes of stars had been arranged is a true temperature sequence. This order, previously indicated by Secchi and Voigt, is now generally expressed by the classification introduced at Harvard by E. C. Pickering, in which the most important classes, passing from the white to the redder stars, are designated by the letters B, A, F, G, K, M.³ On passing from the relatively cool M stars to the hot B stars, it is necessary, in accordance with the work of Lockyer, to employ a gradually increasing stimulus in order to excite the spectra which appear at successive stages of the stellar sequence.

There are certain peculiarities of the successive stellar spectra which call for explanation, if it be assumed that all stars are of essentially the same composition. Thus, at every stage of the stellar sequence there are many elements which are not represented at all, and different selections of the elements appear at the various stages. The earlier attempts to deal with such questions are incompatible with modern views as to the origin of spectra. The new theory of spectra, however, supplemented by a theory of the temperature radiation of gases, has been shown by Dr M. N. Saha⁴ to provide a very probable explanation of most of the phenomena. According to this theory, a gas or vapour may emit radiations, or become ionized, by subjecting it to appropriate thermal stimulus, depending in part upon the density, and the emissions produced mechanically by the spark may thus also be generated by the action of a sufficiently high temperature. Dr Saha concludes that, under the temperature stimulus prevailing in the atmosphere of any particular star, certain elements are excited to radiation of their characteristic lines, in accordance with their resonance and ionization potentials, while other elements are either ionized, or the stimulus is too weak to excite the lines by which their presence could be recognized. When an element is completely ionized in this way, it will often happen that the most characteristic lines of the modified atoms will lie far in the ultra-violet, outside the range of possible observation, so that the element will escape detection. Again, under the action of the highest temperatures, a second step in ionization may set in, producing still more refrangible chief lines as a rule, so that even the elements which yield enhanced lines in the ordinary range of spectrum at some stages will eventually cease to be represented. The simplification of the spectra of the hotter stars thus receives an acceptable explanation, the surviving elements represented in the spectra are those for which the maximum amount of energy is required to produce the successive ionizations, or those for which these conditions yield lines of sufficient intensity within the range of spectrum which is open to observation. Preliminary calculations of the probable temperatures at which such changes of spectrum would occur are in substantial agreement with the temperatures of the various classes of stars deduced from spectro-photometric observations by Wilsing and Scheiner. It therefore seems probable that temperature is the controlling factor in determining the character of the spectrum given by a star, and, as Dr Saha remarks: "The stellar spectra may be regarded as unfolding to us, in an unbroken sequence, the physical processes succeeding each other as the temperature is continually varied from 3000° to 40,000°."

SPEE, COUNT MAXIMILIAN VON (1861–1914), German admiral, was born June 23 1861 at Copenhagen. He was first officer of the battleship "Brandenburg" when it was sent to East Asia in 1899 during the Chinese boxer disturbances. In

1908 he was chief of the staff of the North Sea command, and in 1913 he was appointed chief in command of the Cruiser Squadron. When the World War broke out he was on a voyage with this squadron from Tsing-tau to the South Sea Islands. He was hard pressed by British and Japanese naval forces, but was at an advantage when he was engaged on Nov. 1 1914 off Coronel on the Chilean coast by Adml. Cradock with a British squadron which was inferior to his own in numbers and speed, as well as in range and weight of fire. Adml. Cradock went down with his ship, the "Cape of Good Hope," and the "Monmouth" was also sunk. On the following Dec. 8 Count Spee's squadron was drawn into action off the Falkland Is. by the powerful cruiser squadron of Adml. Sturdee which had been sent out to look for him. Count Spee's own ship, the "Scharnhorst," was sunk, he himself and his two sons going down with all hands. The "Gneisenau" was also sunk, as were the "Leipzig" and the "Nürnberg." The light cruiser "Dresden" escaped, but was afterwards sunk off Juan Fernandez in the Pacific.

SPIELHAGEN, FRIEDRICH VON (1820–1911), German novelist (see 25 667), published during his later years *Freiboren* (1900), *Die schonen Amerikanerinnen* (1902), *Ultimo* (1903), and *Im Wege* (1903). He died at Charlottenburg, Berlin, Feb. 25 1911.

SPIERS, RICHARD PHENÉ (1838–1916), English architect and author. Phéné Spiers occupied a unique position amongst the English architects of the latter half of the 19th century, his long mastership of the architectural school at the Royal Academy having given him the opportunity of moulding and shaping the minds of more than a generation of students. He was educated in the engineering department of King's College, London, and proceeded thence to the atelier Quétel of the École des Beaux-Arts, Paris, for upwards of three years, a method of study rare for an architectural student in those days. On his return he won the gold medal and travelling scholarship of the Royal Academy, and in 1865 the Soane medal of the R.I.B.A. In 1871, after he had worked in the offices of Sir Digby Wyatt and William Burges, he gained second premium with a spirited design (showing a good deal of the Neo-Grec feeling consequent on his French training) for the new Criterion building, London. His work of about this period included Lord Monkswell's house, Chelsea. Phéné Spiers travelled in France, Spain, Egypt, Syria and the East, and besides his record of more purely architectural data, he made many water-colour sketches showing much talent and facility. He was a frequent exhibitor at various galleries, and a good specimen of his art—the loggia at Hampton Court—is in the Victoria and Albert museum. His works and publications were many, and covered a wide ground. Amongst them are his new edition of James Fergusson's *History of Architecture* and the further volumes on Indian and Eastern art, *Architectural Drawing: The Architecture of Greece and Rome* (conjointly with the late W. J. Anderson); *The Mosque at Damascus*; and the articles on Persian and Roman Architecture in Dr. Russell Sturgis's *Dictionary of Architecture*, besides an edition of Pugin's *Normandy*. For the *E. B.* Spiers wrote most of the articles dealing with architecture. The position to which his erudition and ability entitled him was fully recognized in other countries as well as his own, as is shown by his election to membership of many foreign societies in France, Spain and America. He died in London Oct. 3 1916.

SPIRITUALISM: see **PSYCHICAL RESEARCH.**

SPITSBERGEN (see 25 708).—The highest peaks in Spitsbergen are believed to be Mount Newton, 5,676 ft., and Mount Poincaré, 5,446 ft., both in the eastern part known as New Friesland. Mount Eidsvoll in King James Land is 4,770 ft. and Mount Monaco on Prince Charles Foreland is 3,543 ft.

Geology.—Considerable exploration has not greatly modified the main conception of the geological structure. The old rocks of the W., generally described as the Hekla Hook series, seem to be of Silurian age to which may also be ascribed the so-called Archaean rocks of the N.W. There are no Permo-Carboniferous rocks in King James Land and the strips of rocks on the N.E. side of Prince Charles Foreland and the opposite shores of the mainland, formerly attrib-

¹ *Proc. Roy. Soc., A*, xci., 498 (1915).

² *Monthly Notices, R.A.S.*, lxxvii., 511 (1917).

³ The work of H. N. Russell, in general agreement with that of Lockyer, renders it probable that the true sequence is from M to B with increasing temperature, and thence from B to M with decreasing temperature, the density increasing throughout. Stars of rising temperature, on account of their great volume, have been called "giants," those of falling temperature "dwarfs." Differences between the spectra of giants and dwarfs of the same spectral class have been found by Adams (see *Monthly Notices, R.A.S.*, lxxxi., 334).

⁴ *Proc. Roy. Soc., A*, xcix., 135 (1921).

uted to that age, are now known to be Tertiary. Certain of the coal measures in Advent Bay prove to be of Cretaceous and not Tertiary age and these Cretaceous beds probably appear also below the Tertiary beds in Lowe Sound.

An extinct volcano and several hot springs with a temperature of 75° to 82° F. were discovered in Bock Bay, off Wood Bay, in 1910. The volcano seems to date from a later period than any other volcanic manifestation found in Spitsbergen. Research has proved that dislocation has played a great part in determining the main features of the fjord system, especially in Ice Fjord where the course of the fjord has been decided by great faults.

Climate.—From the meteorological data now available, including eight years' records from Green Harbour, the following means may be given: Cape Thorsden, Jan. 0.3° F., July 39.9° F.; Green Harbour, Jan. 6.7°, July 39.7°, Axel I (Lowe Sound), Jan. 1.6°, July 40.3°; S.E. of Edge I., Jan. 1.5°, Aug. 37.4°. Bear I., Feb. 10.4°, Aug. 40.1°. The mean annual precipitation at Green Harbour is 11.6 in.; Prince Charles Foreland has more and the interior of Spitsbergen less.

Exploration.—There is little doubt that the land called Svalbard ("cool coast") in the Icelandic annals, discovered by Norsemen in 1704, was really Spitsbergen. If Spitsbergen was forgotten by the Norsemen it was possibly rediscovered by Russian hunters from the White Sea in the 15th or 16th centuries or at least previous to Barents' rediscovery in 1596.

Recent exploration in Spitsbergen has been devoted mainly to geological work, largely with economic ends in view, and detailed cartographical survey. A German expedition under Lt. Schroeder-Stranz in 1912 came to grief on the N. coast, after the loss of the leader. Half the staff were lost and the survivors were rescued by Norwegians under A. Staxrud.

The principal survey work has been done by Norwegians working in small parties every summer since 1900, assisted by grants from the Norwegian State. These parties have been successively commanded by G. Isachsen, A. Staxrud and A. Hoel, and have mapped in detail the western side of the mainland from the N. coast to the South Cape. The work is expedited by the use of photogrammetric methods to assist triangulation. The detailed survey of Prince Charles Foreland has been completed by Dr. W. S. Bruce and assistants who have also mapped the area between Klaas Billen and Sassen bays. Swedish surveyors have mapped the land round Lowe Sound and Braganza Bay. The Prince of Monaco has shown continued interest in Spitsbergen exploration by giving assistance to several explorers, including the Swiss H. Stoll who in 1913 crossed the unknown country between Lowe Sound and Agardh Bay on Stor Fjord. Lt. W. Filchner in 1910 surveyed the glaciated region between Temple Bay and Mohn Bay. In 1920 J. M. Wordie scaled several of the highest peaks on the W. coast, including Mounts Monaco, Rudmose and Barents. Hydrographic surveys have been carried out by G. Isachsen and others on the W. coast and in Green Harbour, by W. S. Bruce in Foreland Sound, Klaas Billen and Sassen bays and Stor Fjord. Swedish Government surveyors have been at work in Lowe Sound. Oceanographical work has been done in Spitsbergen waters by Dr. F. Nansen. The Norwegian Government has maintained a wireless telegraph station and meteorological observatory in Green Harbour since 1911. A German meteorological station was founded in Eiletoft Haven, Cross Bay, in 1910 as the outcome of a visit by Prince Henry of Prussia and Count Zeppelin when experiments with dirigible balloons were conducted. This station was abandoned in Sept. 1914. In 1920 Norway opened a new meteorological and geophysical station for aerological and geomagnetic research. Besides the Norwegian state wireless station at Green Harbour, there were in 1921 seven others (4 Norwegian, 2 English and one Swedish). In Aug. 1921 a Norwegian Church was consecrated at Longyear City.

Mining.—The development of the coal-fields has proceeded rapidly, greatly stimulated during the war by the scarcity and high price of coal in Scandinavia. The coal-mine in Longyear Valley, Advent Bay, which had been under American ownership since 1905, was sold in 1916 to Norwegians who have been assiduous in their export. Several other Norwegian mines have started, notably in Kings Bay, Green Harbour and Hjorth Haven in Advent Bay. Swedish mines were opened in Lowe Sound (Braganza Bay) in 1917. There are Russian mines in Green Harbour and Dutch mines at Cape Boheman. British enterprise, hampered by war conditions, revived in 1919 in the coal-bearing areas in Klaas Billen Bay and Lowe Sound. By 1920 practically all the coal-bearing areas were annexed by one or other company and at least five mines had reached the export stage. The total amount of coal exported in 1919 was 90,000 tons, all of which went to Norwegian ports, including some to Narvik for the Swedish railways. The coal exported so far is of

Tertiary and Cretaceous age and proves to be good steam coal. Bituminous coal of Carboniferous age will soon be available for export. Jurassic coal occurs but is of poor quality and no longer worked. Mining continues throughout the year but the export season at present is from June to Sept. The largest mining camp is Longyear City in Advent Bay, housing some 400 men in summer and 300 in winter. No other minerals besides coal are as yet exploited commercially, but large deposits of iron ore (36% iron) and gypsum are known, as well as smaller deposits of zinc and asbestos. Signs of oil have been reported. A Norwegian company is exporting coal from Bear Island. The approximate area (in sq. m.) of estates owned by various nationals in Spitsbergen is as follows: British 6,500, Norwegian 900, Swedish 400, Russian 60 and Dutch 10. Whaling was revived in Spitsbergen waters in 1905, abandoned in 1912 and restarted during the World War. The only station is now in Green Harbour. Winter fur-hunting is pursued by a few Norwegians.

Political History.—The question of political control had been discussed since about 1870, mainly by Norway, Sweden and Russia, without any solution being found. Spitsbergen therefore occupied the curious position of being *terra nullius*. In 1907, however, Norway again opened negotiations for an international conference to decide the question of sovereignty, and one was held at Christiania in July-Aug. 1910, followed by another in 1912, without definite result. In July 1914 a conference which included also representatives of Britain, France, Belgium, the United States, Holland and Germany tried to devise a form of administration consistent with the country remaining a *terra nullius*, but the outbreak of the World War put an end to the discussions. In 1919 the Supreme Council conferred the sovereignty of Spitsbergen, including Bear I., on Norway. The signatories of the treaty were Great Britain and the British Dominions, France, Italy, the United States, Japan, Holland, Denmark, Norway and Sweden. The rights and territories of nationals other than those of Norway are safeguarded, and Norway is not allowed to show preferential treatment to Norwegian mining companies or to levy taxes except for expenditure on the administration. Disputed claims to estates were to be decided by a neutral commission presided over by a Dane.

BIBLIOGRAPHY.—The literature is in the main scattered in periodical publications, especially useful are *Ymer* (Stockholm), *Videnskapselskabet's skrifter* (Christiania), *Naturen* (Bergen), *Scottish Geographical Magazine* and *Résultats des Campagnes Scientifiques*, par Albert I., Prince de Monaco, vol. xl, xli, and xlv. Two modern works giving recent history and economic developments are *Spitsbergen, its exploration, hunting and mineral riches*, by R. N. Rudmose Brown (1920), and *Spitsbergens Natur og Historie*, by G. Holmsen (1911). "Fra Ishavet" by G. Isachsen in *Det Norske Geografiske Selskabs Aarbok* (1916-19) gives much information about Norwegian hunters. *The Dutch Discovery and Mapping of Spitsbergen 1596-1829*, by F. C. Wieder (Amsterdam, 1919), has many reproductions of early maps. The meteorological observations at Green Harbour are published annually in *Jahrbuch des Norwegischen Meteorologischen Instituts* (Christiania). *Mit Zeppelin nach Spitsbergen*, by A. Miethe and H. Hergesell (Berlin 1911), is noteworthy for the excellence of its illustrations, including colour plates. Some of the results of the Norwegian surveys are collected in *Expédition Isachsen au Spitzberg 1909-10 Résultats scientifiques* (Christiania 1916). The geomorphology of Spitsbergen is explained by G. de Geer, "On the physiographical evolution of Spitsbergen" in *Geog. Annaler*, 1. (Stockholm 1919). (R. N. R. B.)

SPORTS AND GAMES.—The tendency towards "internationalism" in competitive sports and games had been rapidly growing in intensity, partly as a result of the establishment of the Olympic Games, from 1896 onwards; but it was rudely interrupted by the World War, and conditions were still unfavourable up to 1921 for more than a limited renewal. The decade from 1911 to 1921 offers no proper material, therefore, for a consistent history in this field, by way of supplement to the separate articles in the earlier volumes of this Encyclopædia, nor, indeed, in the case of most sports and games, as carried on in 1910-21, had there been more than minor changes, either in equipment, methods or rules. So far as British and American interests, however, are concerned, the chief statistics, as regards the main events in the more important sports and games, are recorded in the following sections.

Athletics, Track and Field—The Olympic Games were held at Stockholm in July 1912, the highest number of points being scored by the United States, and again at Antwerp in 1920, the 7th Olympic being projected for Paris in 1924.

While the United States won the track and field events of the 1920 Olympic games in Antwerp by a considerable margin in the point score, and set new records in the pole vault, the high jump, and the 400 metre hurdles, the Americans totalled only 9 first places, the same as the team of 24 men from Finland. The "stars" of the American team were C. W. Paddock in the 100 metres, Allan Woodring in the 200 metres, Frank Loomis in the 400-metre hurdles, Richard Landon in the high jump, Frank Ross in the pole vault, Pat Ryan in the hammer, Pat McDonald in the 56-lb weight, and H. H. Brown, the individual winner in the 3000-metre team race, the only American to win a distance event. In swimming the Americans were supreme, with Duke Kahanamoku and Keoloha, both of Hawaii, Norman Ross, Ethelda Bleibtrey, Aileen Riggan and Charlotte Boyle. The winners at the American eastern college meetings were: 1911, Cornell; 1912, Pennsylvania; 1913, Pennsylvania; 1914, Cornell; 1915, Cornell; 1916, Cornell; 1918, Cornell; 1919, Cornell; 1920, Pennsylvania; 1921, California. Princeton won against Oxford (July 8 1920) at Queen's Club, London, by 6 events to 4. At the Pennsylvania Relay Games (April 30–May 1 1920) the Oxford-Cambridge 2-m team, Tatham, Stallard, Milligan and Rudd, set a new world's record of 7 min 50 sec.

Cricket—Before the war English cricket was in a flourishing condition. The visit of a South African team to Australia in 1910–1, in which the South Africans did hardly as well as had been expected, served as a prelude to the so-called Triangular Tournament of 1912; and in the meantime an English team under the management of the Marylebone Cricket Club carried through a successful tour in 1911–2. Of 18 eleven-a-side matches the M.C.C. team lost only the first test match, four were drawn, and 18, including four test matches, were won by the Englishmen. At the end of 1910 a team went to South Africa by the M.C.C. won two and lost three test matches. In 1912 the interest in county cricket was largely eclipsed by the Triangular Tournament between England, Australia and South Africa, in which nine test matches were played. England proved victorious, winning four matches (three against South Africa and one against Australia) and drawing twice with Australia, owing to bad weather. The Australians beat the South Africans twice. Of the 102 matches played up to 1920 between England and Australia, England won 46 and Australia 35. Of those played in England the home team won 17 and Australia 8, and 17 were drawn. In those played in Australia England won 30 and Australia 27, three being drawn. In 1921, however, in their visit to England, the Australians won an easy victory.

A new method of deciding the English county championship was inaugurated in 1911. With the idea of discouraging the players from aiming at drawn matches, five points were given for a win, and three points (with one point to the losing side) for a first-innings victory. The championship was won by Warwickshire in 1911, by Yorkshire in 1912 and by Kent in 1913. In 1914 the championship was not decided owing to the outbreak of war, but the M.C.C. Committee adjudged Surrey the winners. It was resumed in 1919, when a new system was adopted, by which only wins counted, the winners being the county with the highest proportion of wins to matches played. Yorkshire was at the head of the list in 1919, and Middlesex in 1920 and 1921.

The Oxford and Cambridge match was not played between 1915 and 1918. In 1911, 1914 and 1919 Oxford won, and in 1912, 1913 and 1921 Cambridge were the winners, the match in 1920 being drawn. From 1911 to 1921, with the exception of the years 1915 to 1918, when the match was not played, Eton won against Harrow.

English Football—(1) Rugby.—In 1911 a French team for the first time was victorious in an international match, beating Scotland in Paris. In the same season Wales beat England, Ireland, Scotland and France; Ireland beat England, Scotland and France; England at Twickenham beat Scotland and France. In 1912 all the international matches that took place in the United Kingdom were won by the fifteen playing in its own country. England defeated Wales and Ireland, but narrowly lost to Scotland. Ireland beat Scotland and Wales, and Wales beat Scotland. In no match was France victorious. A strong South African team began a tour in Great Britain in the autumn of 1912. After gaining several decisive victories over counties, the South Africans lost to Newport, were with great difficulty victorious over Llanelli, the United Services and London, beat Oxford and Cambridge Universities, were narrowly beaten at Twickenham by another London fifteen, and easily beat Scotland at Edinburgh. They next gained their most decisive victory at Dublin, securing 36 points against Ireland, and beat Wales by a try at Cardiff, but lost to Swansea by the same margin. In the international matches in 1913 England defeated Scotland, Wales, Ireland and France; Wales beat Scotland, Ireland and France; Scotland beat Ireland and France; and Ireland beat France. In 1914 England beat Scotland, Wales, Ireland and France; Wales beat Scotland, Ireland and France; and Ireland beat Scotland and France. From 1915 to 1919 the matches were not played. In 1920 England beat Scotland, Ireland and France, Wales beat England, Ireland and France, Scotland beat Wales, Ireland and France, and France beat

Ireland. The University match went in favour of Oxford in 1910, 1911, and 1913. Cambridge won in 1912, 1914, 1915 and 1920. (2) Association.—In 1910 a tour was undertaken in Brazil by the Corinthian Football Club, and another in North America in 1911–2. From 1907 to 1914 amateur international football was affected by a dissension among English clubs. In consequence of the Football Association insisting upon the admission of professional clubs (so-called) to the district associations, a large number of amateur clubs, including the University, College and Public Schools Club, seceded to form the Amateur Football Association. The officers of the army, while sympathizing with the seceders, considered it advisable for the sake of regimental football to retain their connexion with the Football Association. But in 1911–2 they used their influence to promote a reconciliation. A conference was held at which the delegates of the two associations only failed to arrive at an agreement because the older body would not accept an arrangement by which the younger could receive the adherence of newly formed amateur clubs. In 1914, however, the Football Association and the Amateur Football Association sank their differences. The Amateur eleven of the Football Association won matches with Wales, Belgium, France and Holland in 1910–1, but lost to Ireland. In 1911–2, besides victories at the Olympic Games, they defeated Ireland, Wales, Denmark, Holland and Belgium. The Amateur Football Association teams beat Wales and France in both seasons. The full representative eleven of the Football Association defeated Ireland and Wales in 1911 and drew with Scotland. Ireland lost to Wales and Scotland, and Scotland drew with Wales. In 1912 England and Scotland again played an indecisive match, but both beat Wales and Ireland, Wales lost three matches. In 1913 England beat Scotland and Wales, Wales beat Ireland and drew with Scotland, Scotland beat Ireland, and Ireland beat England. In 1914 England beat Wales; Scotland beat England, Ireland beat England and Wales and drew with Scotland; and Wales drew with Scotland. In 1920 England beat Scotland and Ireland, Wales beat England and drew with Ireland and Scotland; and Scotland beat Ireland. The Football Association Cup was won in 1911 by Bradford City, in 1912 by Barnsley, in 1913 by Aston Villa, in 1914 by Burnley, in 1915 by Sheffield United, and in 1920 by Aston Villa. The championship of the Football League was carried off by Manchester United in 1911, by Blackburn Rovers in 1912, by Sunderland in 1913, by Blackburn Rovers in 1914, by Everton in 1915, and by West Bromwich Albion in 1920. The principal trophy of the Amateur Football Association was won in 1911 by the Old Malvernians, in 1912 by Oxford City, in 1913 by the New Crusaders, in 1914 by Ealing, and in 1920 by Dulwich Hamlet. The Arthur Dunn cup for public school clubs fell to the Old Reptonians in 1911, to the Old Malvernians in 1912, to the Old Brightonians in 1913, to the Old Reptonians in 1914, to the Old Wykehamists in 1920, and to the Old Carthusians in 1921. Oxford won the University match in 1911 and Cambridge won in 1912, 1913, 1915; in 1914 and 1920 the match was drawn.

American Football—Of all amateur sports in America, college football (the American Rugby game) drew the largest crowds and aroused the greatest enthusiasm. Occasional professional teams drew big gate receipts, especially in Ohio and Michigan, where the professional game was popular, but in general it was not encouraged. After 1908 a number of colleges abandoned football because of the deaths and injuries that resulted from the old-style mass playing. In the following years, especially in 1910 and 1912, radical revisions of the old rules were made; the new rules were designed to foster a more open style of play and to make the game more interesting to spectators. The periods of play, formerly two halves of 35 min each, were altered to four periods of 15 min each, with an intermission of one minute between the first and second, and third and fourth periods, and 15 min between the second and third periods. The playing field, from goal line to goal line, was shortened from 110 to 100 yd and each side was given four trials in which to make the required 10 yd. The removal of the restrictions on the forward pass was one of the most conspicuous changes; this with other new rules, had the effect of encouraging an open, running game, in which the advantage lay rather in quick thinking and skillful playing than in mere weight or strength. The full possibilities of the new rules were not realized for some time, but, as familiarity with them increased, the play became more spectacular, and there was no question that the game had been improved from the standpoint of both spectator and player. Ordinarily the schedule of football games was not designed to determine the champion team among eastern colleges, therefore in reviewing the football games of the decade 1910–20 the choice of the strongest teams is to some extent a matter of opinion. From 1910 to 1915, inclusive, Harvard University had a succession of strong teams, which in nearly every year gained what appeared to be a clear title to the championship. The succession was interrupted in 1911, however, when Princeton defeated both Harvard and Yale. In the next year the honours went to the smaller colleges—especially the university of Pittsburgh and Colgate University—and this was interpreted as due in part to the fact that the new rules had removed certain handicaps from the less powerful teams. Football probably had never been so popular as in 1916, it was estimated that in that year 35,000 games were played throughout the United States, with an attendance of 6,500,000. Owing to the entrance of the United States into the war, the

major teams practically cancelled their schedules during the two following years, but in the army and navy every unit had its team. A full schedule was played by the A. E. F., the winners being the 89th Div. team, captained and coached by Captain Gerhardt of West Point. The resumption of college games in the east in 1919 showed that college football had lost none of its popularity. One of the strongest teams of 1919 was that of Pennsylvania State College, though Harvard went through the season without experiencing defeat. Despite a tie with Harvard, Princeton was generally conceded to have had the best team turned out in the east in 1920, the first really normal year of play after the war. The tendency among colleges was more and more towards open play, with much kicking and forward passing. The east, however, continued to play a far more conservative game than was popular in the west and south. Among the colleges of the middle west the strongest teams were Michigan (1910), Minnesota and Michigan (1911), Wisconsin (1912), Chicago (1913), Illinois (1914), Illinois and Minnesota (1915), Ohio State (1916-7), Illinois (1918-9), Ohio State (1920). Ohio State, champions of the middle-west group in 1920, played an intercollegiate match at Pasadena at the Festival of Roses in that year with the university of California, and was badly defeated. The large attendance at football matches led to the construction of immense stadiums of concrete and steel to accommodate the crowds. Two of these stadiums, those at Harvard and at Syracuse University, had been constructed before 1910, after that year there were built a number of others, among which the most noteworthy were, perhaps, those at the university of Chicago, Yale (the "Yale Bowl"), the university of Michigan, Princeton (the Palmer Memorial stadium), the university of Pennsylvania and the college of the city of New York. The greatest of these structures, the Yale Bowl, has exterior dimensions of 940 by 744 ft. and a permanent seating capacity of 61,000. This huge amphitheatre cost more than \$500,000 and is considerably larger than the Roman Colosseum, which had a seating capacity of about 45,000. The Palmer stadium at Princeton provides seats for 41,000 and cost \$350,000.

The Association game made remarkable gains in popularity not only among American colleges and the country clubs, but among the big industries as well. Each year the United States Football Assn. conducted a national cup competition, the final round of which was won in 1920 by the Ben Miller Athletic Club of St. Louis from the Fall River Club of Quincy, Mass. Previous winners include the Bethlehem Steel Co., the Fall River Rovers, and the Brooklyn Field Club.

Baseball, the universal American sport, occupied the attention of the public in the United States chiefly as a professional game in which the leading cities were represented by baseball teams comprising two major leagues—the American and the National. At the end of each year the winning teams of the two leagues played what was known as the world series for the championship. During 1910-20 these contests were by far the most popular of all annual sporting events. This is indicated by the attendance and gate receipts, which in 1920 were 174,414 and \$564,800, respectively, and in 1919, 236,928 and \$722,414, as against an attendance of 125,222 and receipts of \$173,980 in 1910. In the following list of world-series contests since 1910, the name of the winning team is given first, that of the losing team second, and the score in games third: 1910, Philadelphia (American League) vs. Chicago (National League), 4-1; 1911, Philadelphia (A. L.) vs. New York (N. L.), 4-2; 1912, Boston (A. L.) vs. New York (N. L.), 4-3, one game tied; 1913, Philadelphia (A. L.) vs. New York (N. L.), 4-1; 1914, Boston (N. L.) vs. Philadelphia (A. L.), 4-0; 1915, Boston (A. L.) vs. Philadelphia (N. L.), 4-1; 1916, Boston (A. L.) vs. Brooklyn (N. L.), 4-1; 1917, Chicago (A. L.) vs. New York (N. L.), 4-2; 1918, Boston (A. L.) vs. Chicago (N. L.), 4-2; 1919 Cincinnati (N. L.) vs. Chicago (A. L.), 5-3; 1920, Cleveland (A. L.) vs. Brooklyn (N. L.), 5-2. In 1914 an attempt was made to organize a third major league, known as the Federal, but this was unsuccessful, and at the end of the following season it was amalgamated with the two older leagues. After 1919 baseball was for a time under a cloud, owing to charges that certain members of the Chicago American League team had been bribed by outside persons to lose the 1919 world series. The accused players were expelled from organized baseball, and there was a general overhauling, with the result that final authority over the game was given to Kenesaw Mountain Landis, a Federal judge known for his proficiency in the law and his knowledge of baseball. During the World War American soldiers carried the game to England and France, where it was a favorite diversion in the camps of Canadian and U.S. soldiers. The professional game enjoyed an extraordinary revival after the war, the crowds breaking all records, especially since Sunday playing was more generally permitted by law than before. Colleges generally resumed the game, though interest in college baseball was slight in comparison with interest in college football.

Lawn Tennis—American players, during 1910-21, were in the forefront, but an increasingly high standard of play was being shown among other nationalities besides the British and American, notably the French and Japanese. The International Davis Cup was won by Australia in 1911 and 1914, by the British Isles in 1912, and by the United States in 1913 and 1920. In 1911 the United States team (Larned, McLoughlin, Little and Bundy), were beaten by

Australia (Brookes, Dunlop and Heath) after beating Great Britain (Dixon, Lowe and Beamish). In 1912 Great Britain (Dixon, Parke and Beamish) defeated Australia (Brookes, Heath and Dunlop). In 1913 the United States (Hackett, McLoughlin, Little and Williams) beat Great Britain (Parker, Dixon, and Roper-Barrett). In 1914 Australia (Brookes, Wilding, Dunlop and Doust) beat the United States (McLoughlin, Williams, Behr and Bundy); McLoughlin defeated Brookes in a memorable match (14-16, 6-3, 6-3), and Wilding by 6-2, 6-1, 2-6 and 6-2, but McLoughlin and Bundy lost the doubles to Brookes and Wilding. In 1920 the United States (Hardy, Johnston, Tilden, Williams and Garland) defeated Great Britain, France and Australia.

In the English singles (world's) championships A. F. Wilding won in 1911, 1912 and 1913; N. E. Brookes in 1914, G. L. Patterson in 1919, and W. T. Tilden in 1920 and 1921. Mrs. Lambert Chambers won the English ladies' singles in 1911, 1913 and 1914; Mrs. Larncombe in 1912; and Mlle. S. Lenglen in 1919, 1920 and 1921. In the English covered court championship A. H. Gobert won the singles in 1911, 1912, 1920 and 1921; Gobert and M. J. G. Ritchie won the doubles in 1911, Wilding and S. N. Doust won the doubles in 1912 and 1913. P. M. Davson won the English singles in 1913 and 1919. In 1914 Ritchie won the English singles and in 1914 and 1921. M. Mayngordato and Davson won the doubles. In 1919 the English doubles were won by R. Lycett and R. W. Heath, and in 1920 by Gobert and Lycett.

In the United States, William A. Larned won the championship for the seventh time in 1911, his experience proving too much for the challenger, Maurice F. McLoughlin; the doubles went to Raymond D. Little and Gustave Touchard, while Miss Hazel Hotchkiss won the women's title for the third time. In 1912 McLoughlin won the American championship, Larned not being in the tournament. McLoughlin and Thomas Bundy won the doubles from Little and Touchard, and Mary Browne won the women's championship. The outbreak of war in 1914 robbed the Newport tournament of interest. The German team was interned in England on the way home. Meantime Williams won the national title, and McLoughlin and Bundy the doubles. In 1915 much attention was paid to building up the junior tournaments. There was no international competition. William M. Johnston, of California won the championship. With Clarence J. Griffin, another Californian, he also won the doubles. Miss Molla Bjurstedt (later Mrs. Mallory), won the women's championship. In 1916 the United States was the world's lawn-tennis centre. The season was marked by the appearance of two Japanese players, Kikumaru and Mikami, in the principal tournaments. Williams won the national singles title, Johnston and Griffin the doubles. Miss Bjurstedt took every title she contested. In 1917, with the United States in the war, tennis was transferred to the army and navy, all the ranking 10 players being in the services. The "patriotic" singles, in lieu of a national championship, was won by R. L. Murray, a Californian settled in the east. In 1918 R. L. Murray won the title in straight sets from William T. Tilden. Tilden and Vincent Richards won the doubles title. In 1919 Johnston won the singles title from Tilden, while Brookes and Gerald Patterson, from Australia, took the doubles. Brookes, Patterson, Lycett and Thomas, of Australia, invaded the United States, but were beaten at Forest Hills, 4 matches to 0, by Johnston and Williams, and in the doubles by Tilden and Johnston. In 1920 Tilden won back the singles titles from Johnston, while Johnston and Griffin won the doubles.

Polo—The United States retained the cup against England at Meadowbrook in 1911, winning by 2 to 0, the American team consisting of the famous "big four," Lawrence Waterbury and J. M. Waterbury (forwards), Harry Payne Whitney (No. 3), and Devereux Milburn (back). In 1913 the same team won again by 2 matches to 0. In 1914 Lord Wimborne's team took the trophy to Great Britain winning 2 straight matches from an American team consisting of Milburn, who played both 3 and back, the two Waterburys, and Rene La Montagne. In 1921 an American invasion of Hurlingham was led by Devereux Milburn, whose team, consisting of himself at back, J. Watson Webb at No. 3, Thomas Hitchcock, Jr., at No. 2, and Louis E. Stoddard at No. 1, brought the cup back to the United States winning 2 straight matches by 11 to 4 and 10 to 6.

Yachting—Just before the outbreak of the war Sir Thomas Lipton renewed his challenge for the America's Cup, there having been no races since 1903. "Shamrock IV," a much-criticized boat, was sent to a drydock in Brooklyn, while "Resolute" and "Vantite" reappeared and contested the right to sail as defender. The thirteenth series of races for this trophy was not sailed until July 15-27, 1920, off Sandy Hook. The challenger was designed by C. E. Nicholson and was sailed by Capt. William P. Burton, an amateur skipper. Capt. Andrew Jackson Applegate, an American familiar with conditions on this course, acted as professional pilot. The defender was "Resolute," winner of 7 out of 13 races against "Vantite," 4 being won by the latter and 2 called off. "Resolute" was built by a syndicate of New York yachtsmen, composed of J. P. Morgan, Cornelius Vanderbilt, Arthur Curtiss James, George F. Baker and others. The skipper was the well-known amateur, Charles Francis Adams of Boston. The sailing-master was Capt. Chris Christensen, he and the mates being of Scandinavian birth but American citizens. The defender was designed by Nat. Herres-

hoff, of the Herreshoff family of Bristol, R.I. The first 2 races were won by "Shamrock," the last 3 and the cup by "Resolute." Twice the yachts failed to finish within the 6-hour time limit. Once the wind was deemed too strong to permit a start. It was feared that with lee decks awash there was risk of losing a man overboard. In all but one race "Resolute" was allowed 6 min. 40 sec. handicap, due largely to the challenger's great sail area with Marconi mast and extreme hoist. In the same year was held the first race for the championship of the North Atlantic fishing fleet off Halifax. "Esperanto," United States, defeated "Delawanna," Canadian, in two straight races over a 40-m. course, for \$4,000 and a cup.

Golf. In Great Britain, H. Vardon was the champion in 1911 and 1914, E. Ray in 1912, J. H. Taylor in 1913, G. Duncan in 1920, and Jock Hutchison in 1921. In the amateur championships H. H. Hilton won in 1911 and 1913, John Ball in 1912, J. L. C. Jenkins in 1914, J. H. Tolley in 1920 and W. I. Hunter in 1921. The ladies' open championship fell to Miss D. Campbell in 1911, to Miss G. Ravenscroft in 1912, to Miss Muriel Dodd in 1913, and in 1914, 1919, 1920 and 1921 to Miss C. Leitch.

In the United States the amateur championship was won by H. Hilton in 1911 and by Jerome Travers in 1912. J. J. McDermott won the open tournament both in 1911 and 1912. Travers defeated Anderson for the amateur title in 1913, and Francis Ouimet won the open title, after a tie with Harry Vardon and Ted Ray of England. No amateur before had won this title, and Ouimet was only 20 years old. Miss Gladys Ravenscroft, of England, won the American ladies' championship in 1913. In 1914 Ouimet defeated W. C. Fownes for the amateur title, and Walter Hagen won the open from a field of English, French and Scotch professionals, the women's title went to Miss Georgiana Bishop. The amateur title for 1915 went to Robert M. Gardner; and Jerome Travers won the open, the second triumph of an amateur. In 1916 "Chuck" Evans took the amateur title from Gardner, and the open from the professional Jock Hutchison. With the United States at war in the following year golf was abandoned save as exhibitions were given in aid of the Red Cross. The first revival came in 1918 with a match in Canada between American and Canadian amateurs, which was won by the Canadians, 23 to 19. A complete revival followed in 1919; S. Davidson Herron won the amateur title, though four former champions, Travers, Gardner, Ouimet and Evans, were entered. "Bobby" Jones was the runner-up. The open was won by Walter Hagen, while Miss Alexa Stirling easily took the women's title. Gardner went to England in 1920 for the amateur championship, and was only beaten in the final, after an extra hole, by Cyril J. Tolley, the Oxonian. Ray and Vardon made this year a remarkable invasion of the United States, Ted Ray winning the open championship. The amateur title went to Evans. The U.S. team easily won the Devonshire Cup from Canada. In 1921 an American invasion of England by the strongest of professional and amateur teams resulted in the winning of a team match by the Americans, and of the open championship by Jock Hutchison, of St. Andrews, a naturalized American.

Horse Racing.—The following is a list of the winners of the Derby in England from 1911 to 1921:—

Winner	Owner	Trainer	Jockey
1911 Sunstar	Mr J. B. Joel	C. Morton	G. Stern
1912 Tagalie	Mr Raphael	D. Waugh	J. Reiff
1913 'Aboyeur	Mr Cunliffe	Lewis	Piper
1914 Durbur II.	Mr H. B. Duryea	(trained in France)	MacGee
1915 'Pommern	Mr S. B. Joel	C. Peck	S. Donoghue
1916 'Fifinella	Mr E. Hulton	R. C. Dawson	J. Childs
1917 'Gay			
Crusader	Mr Fairie	A. Taylor	S. Donoghue
1918 'Gainsborough	Lady James Douglas	A. Taylor	J. Childs
1919 Grand			
Parade	Lord Glanely	Barling	F. Templeman
1920 Spion Kop	Major G. Loder	Gilpin	F. O'Neill
1921 Humorist	Mr J. B. Joel	Morton	Donoghue

¹ Craganour, who came in first, was disqualified.

² "New Derby" run at Newmarket.

Other "classic" races resulted as follows:—

	Doncaster	2,000-guineas	1,000-guineas
1911 Oaks	St. Leger	Newmarket	Newmarket
1912 Cherimoya	Prince Palatine	Sunstar	Atmah
1913 Mirska	Tracery	Sweeper II.	Tagalie

1921 Love in Idleness		Craig an Enan	Bettina

¹ Run at Newmarket.

In 1914, before the season was half over, came the war. During most of August racing was suspended, partly because of difficulties of transit and also because some courses were occupied by the military. Owing largely to the King's desire that the interests of the many people employed in racing establishments should not be endangered, the remaining fixtures were carried out, so far as regarded the more important ones. For the first time since 1865 the Derby was won by a horse bred and trained in France, Durbur II. On May 16 1915 the Jockey Club issued a notice suspending all racing under their jurisdiction, except the Newmarket fixtures, until further notice. Substitute races for the Derby, Oaks and St. Leger were arranged at Newmarket.

In the United States, too, horse-racing was interrupted by the war, but there was a prompt revival afterwards. In 1920 Man-O-War, a chestnut colt by Fair Play-Mahubah, from the Glen Riddle Farm, and trained by Louis Feustel, started in 21 races, winning 20 and taking one second. Its total winnings amounted to \$244,465. Man-O-War held the American running records for 1 m. (1 min. 35 $\frac{1}{2}$ sec.), 1 $\frac{1}{4}$ m., 1 $\frac{1}{2}$ m. and 1 $\frac{3}{4}$ m. The climax of the 1920 season was a match race between Man-O-War, owned by Samuel Riddle, and Sir Barton, owned by Commodore Ross of Canada, at a mile and a quarter, at the Kenilworth track, Windsor, Ont. The race was for a purse of \$75,000 and a \$5,000 cup offered by A. M. Orpen. Man-O-War won by seven lengths in 2 min., 3 sec., three seconds slower than the record made by Whisk Broom II in 1913.

Rowing.—For the professional championship of the world, the following contests took place:—

1910—R. Arnst beat E. Barry on Zambesi
1911—R. Arnst beat H. Pearce on Parramatta.
1912—E. Barry beat R. Arnst on Thames
1912—E. Barry beat E. Durian on Thames.
1913—E. Barry beat H. Pearce on Thames.
1914—E. Barry beat J. Paddon on Thames
1919—A. D. Felton beat E. Barry on Thames
1920—E. Barry beat A. D. Felton on Parramatta.

In England the winners in the Oxford and Cambridge boat races for 1911-21 were:—

1911	Oxford	1915-9	Not rowed
1912	Oxford	1920	Cambridge
1913	Oxford	1921	Cambridge
1914	Cambridge		

In the 1912 races, as originally rowed, both boats became waterlogged and Cambridge sank. But the race was rowed again the following Monday, Oxford winning.

American rowing, interrupted by the war, was promptly revived, and assumed an international character when in 1920 the veteran crew of the U.S. Naval Academy at Annapolis defeated a picked English eight over the canal course at Brussels for the Olympic championship. In 1921 the Annapolis crew, with two new men in the boat, was defeated by Princeton University in a race on Carnegie Lake, over a course of a mile and three-quarters. The same Annapolis crew in the same year won the revival of the Poughkeepsie Regatta over three miles, easily defeating California, Cornell, Pennsylvania, Syracuse and Columbia, the last named up to that time an unbroken combination. Yale defeated Harvard in 1921, on the Thames river at New London, Conn., at four miles, using English rigging and boat, and being coached in the last two weeks by James Cordery, an English sculler, who had succeeded Guy Nickalls at the eleventh hour as coach at New Haven. In 1920 Harvard beat Yale, but the previous year Yale won under the coaching of Prof. Mather Abbott, an Englishman who had taught rowing for many years at St. Paul's School, Concord, Syracuse in 1916 won the Poughkeepsie Regatta under the coaching of James A. Ten Eyck. In 1920 Charles E. Courtney, Cornell's rowing coach, the foremost of American coaches, died. The winners of the American intercollegiate regatta after 1909 were Cornell (1910, 1911 and 1912), Syracuse (1913), Columbia (1914), Cornell (1915), Syracuse (1916 and 1920), Annapolis (1921). The Yale-Harvard races were won as follows: Harvard (1910, 1911, 1912, 1913), Yale (1914 and 1915), Harvard (1916), Yale (1919), Harvard (1920), Yale (1921).

Boxing.—The official maximum boxing weights (Great Britain and the United States) are as follows:—Flyweight, 8 st. (112 lb.); Bantamweight, 8 st. 6 lb. (118 lb.); Featherweight, 9 st. (126 lb.); Lightweight, 9 st. 6 lb. (132 lb.); Welterweight, 10 st. 7 lb. (147 lb.); Middleweight, 11 st. 6 lb. (160 lb.); Light-Heavyweight, 12 st. 7 lb. (175 lb.); Heavyweight, no maximum.

In 1920 the official list of the world's champions was:—*Flyweight*, Jimmy Wilde (Gt. Britain); *Bantamweight*, Peter Hermann (U.S.A.); *Featherweight*, Johnny Kilbane (U.S.A.); *Lightweight*, Benny Leonard (U.S.A.); *Welterweight*, Jack Britton (U.S.A.); *Middle*, Mike O'Dowd (U.S.A.); *Heavy*, Jack Dempsey (U.S.A.).

The results of the Amateur Boxing Association Championships in England were as follows in 1911-4:—

Bantamweight	Featherweight	Lightweight
1911 W. W. Allen	H. Bayers	A. Spenceley
1912 W. W. Allen	G. R. Baker	R. Marriott
1913 A. Wye	G. R. Baker	F. Grace
1914 W. W. Allen	G. R. Baker	R. Marriott

Middleweight	Heavyweight
1911 W. Child	W. Hazell
1912 E. V. Chandler	R. Smith
1913 W. Bradley	R. Smith
	(walked over)
1914 H. Brown	E. V. Chandler

In professional contests the bantamweight championship of England was won by Digger Stanley against Alec Lafferty in 1912, by B. Beynon in 1913 (vs Digger Stanley) and by Curly Walker in 1914 (vs C. Ledoux). Fred Welsh was the lightweight champion of England in 1912 (vs Matt Wells), 1913 (vs H. Mehegan) and 1914 (vs W. Ritchie). Johnny Sumners was the welterweight champion of England in 1912 (vs Arthur Evernden) and 1913 (vs S. Burns). Jack Harrison was the middleweight champion of England in 1912 (vs Private McEnroy). In 1913 (vs Paddy Mahoney) and 1914 (vs Cohn Bell). Bombardier Wells was the heavyweight champion of England, and in 1913 (vs Alec Lambert). Kid Lewis was the featherweight champion of England. In 1912 Jim Driscoll (Cardiff) won the featherweight championship of the world against Jean Poesy (France), Jack Johnson (America) (heavyweight champion of the world) beat Jim Flynn (America), Georges Carpentier (France) beat Jim Sullivan (England), Frank Klaus (America) beat Carpentier, Billy Papke (America) beat Carpentier.

In 1913, in the middleweight championship of the world, F. Klaus beat Billy Papke, in lightweight championship of the world F. Welsh beat H. Mehegan, in featherweight championship of the world, J. Driscoll and Owen Moran drew, and in heavyweight championship of Europe, Carpentier beat Bombardier Wells.

In 1914, in lightweight championship of the world, F. Welsh beat W. Ritchie, and in heavyweight championship of Europe, Carpentier beat Gunboat Smith.

In 1915, at Havana, Jess Willard defeated Jack Johnson in the 25th round for the world's championship.

In 1919, at Toledo, U.S.A., Jack Dempsey beat Jess Willard (holder) for the world's championship in the 3rd round.

On Dec. 4, 1919, at the Holborn Stadium, London, Carpentier beat Joe Beckett in a fight for the heavyweight championship of Europe. Beckett was knocked out in the first round after the fight had lasted one minute fourteen seconds. In 1921 Carpentier was beaten at Jersey City, U.S.A., by Dempsey, in the 4th round, in a contest for the heavyweight championship of the world, the greatest interest having been excited by this fight.

Swimming.—American swimmers in 1920 held a majority of the world's records. A large number of these records were held by three men—Duke Kahanamoku of Hawaii, Percy McGilvray of Chicago and Norman Ross of San Francisco. Kahanamoku won the 100-metre race at the Olympic games of 1920, establishing a new world's record of 1 min. 2½ sec. Ross was winner in two events (400 metres and 1,500 metres). Warren Kealoha of Honolulu was victorious in the 100-metre backstroke race, and the American team carried off the honours in the 800-metre relay. Two races were lost to Swedish swimmers. American women also proved themselves good swimmers, one of their triumphs was the defeat in 1919 of two Australians, Miss Fanny Durack and Miss Wylie, who visited the United States in that year. The victorious Americans were Miss Ethelda Bleibtrey and Miss Charlotte Boyle, both of Brooklyn. Miss Bleibtrey won a number of races at the Olympic games in 1920, where she established a record of 4 min. 34 sec. for 300 metres open water.

English Billiards.—Since the prohibition of consecutive spot hazards and the push stroke, English professionals have relied chiefly upon the top-of-the-table game. An innovation, however, was introduced in 1911 by the Australian, George Gray, who repeatedly made huge breaks by means of a series of losing hazards from the red ball. In all, he scored 24 breaks of four figures, of which the highest was 2,196. Gray invariably declined to play matches with ivory balls, and these breaks were not made under Billiard Association rules. H. W. Stevenson, though not at his best in 1911, beat M. Inman twice for the championship of the Billiards Control Club. In Jan. 1912 George Gray met Stevenson and defeated him in two games out of three of 18,000 up. M. Inman beat T. Reece for the Billiard Control championship in 1912, 1913 and 1914. In 1919 Inman beat Stevenson in the Billiard Association championship by 6,532 points in 16,000. In 1920 W. Smith beat C. Falkner in the Billiard Association championship by 1,500 points in 16,000. In 1921 Newman beat Reece in the professional championship by 5,256 points in 16,000.

In 1911 H. A. O. Lonsdale did not defend his title of amateur champion, and the cup reverted to H. C. Vorr. An alteration was made in the arrangements, the champions of England, Ireland, Scotland and Wales meeting in competition in the finals. Vorr beat Major Fleming by only seven points in 3,000 for the amateur championship in 1912. The influence of Gray's example was plainly perceptible in this competition in the use made of the losing hazard. In 1913 Vorr beat J. Nugent by 1,044 points in 3,000 and in 1914 by 1,962 in 3,000. In 1914 the Scottish championship was won by A. Cronen, and the Welsh championship by A. Paton. In 1915 the Welsh champion was A. Cable. In 1915 the United Kingdom Amateur Championship was won by A. W. T. Good (England) by 3,000 points to 2,716. In 1918 it was won by Graham Symes

by 2,000 points to 1,721. In 1919 S. H. Fry won the Amateur championship by 2,000 points to 1,729, but in the Billiard Control Club's Amateur Championship Tournament was beaten by Major Fleming by 2,000 points to 1,903. In 1920 Fry again won the Amateur Championship, by 3,000 points to 2,488.

A break of 1,016 was made by Stevenson in 1912 against W. Cook, without a series of spot strokes, anchor cannons or long successions of losing hazards. Stevenson made a break of 919 in 1913, and in the same year M. Inman made one of 894. In 1903 the amateur S. H. Fry made a break of 236.

Archery.—The opportunity may be taken here to correct the earlier article on ARCHERY in some particulars. The bow now used by men is from 6 ft. 1 in. to 6 ft. 4 in. in length, a lady's bow ranges from 5 ft. 6 in. to 5 ft. 8 in., measured between the nocks, these lengths according in the one case with an arrow of 27 in. to 28 in. and in the other with an arrow of 25 in. to 26 in. Exceptionally long arms may render necessary an arrow an inch longer and a corresponding addition of one or two inches to the bow. The "weight" of a bow is the number of pounds required, when appended to the string, to draw to the head an arrow of 28 in. for a man's bow or 25 in. for a lady's. The weight of men's bows varies from 36 lb. to 58 lb., of ladies' from 18 lb. to 30 lb., the lighter weights being sufficient for beginners. Bows are styled "self" or "backed" according as they are made of one wood or of two or more glued together. "Self bows," if of yew, are usually made of two pieces joined by a double fish splice at the handle, as it is difficult to find a piece of this wood (incomparably the best) of sufficient length while free from knots. If made of lance they are invariably of a single piece. "Backed bows" may be of yew, backed either with the same wood or with hickory, or alternatively of washaba or of ruby, lance, or other woods backed with hickory; the back being the flat side of the bow, and the "belly" the rounded side. Three woods are sometimes employed, a thin strip of fustic being interposed between a belly of yew and a back of hickory. There should be an inflexible centre of about 21 inches, whence the bow should taper gradually towards each end. It should be straight, the back true, and, when strung, the string should appear to cut the belly into two equal parts. Self yew bows are the best. They are light in the hand, the sweetest to pull, and have the best cast, but they require careful handling. They are also expensive, costing from £5 to £15, and they are liable to "crysals," or tiny cracks, which gradually spread until the bow breaks. A yew backed yew, which is next in merit, can be bought for £5 and is somewhat less liable to crysals. Between the others there is little to choose, provided that they are properly made, and not "reflexed," as they are said to be when the ends bend outward, for these jar the hand. Their price varies from 25s. to 3 guineas. The string for a man's bow should be from 6 in. to 6½ in. from the back of the bow when strung, for a lady's from 5½ in. to 6 in., according to the length of the bow. The nock of arrows—it is never called the "notch"—should not be "cut square" but rounded. The feathers must be wing and not body feathers, which are quite useless. They should be from the same wing, i.e. right or left, about 1½ in. long and tapering to the front from a depth of ¼ in. at the nock. If balloon shaped, their greatest depth should be at one-third of their length from the nock-end.

With regard to target scoring and handicapping it should be noted that a St. George's Round has never been shot at a public meeting, or, indeed, at any meeting held within the last 60 years. Handicapping by the loss of rings has been obsolete for more than 35 years, nor is there any system which can rightly be called handicapping by points. Handicapping is now carried out either by dividing the archers into classes according to their powers, or by deducting percentages from their scores for previous successes.

As regards the history of archery, some corrections may also be made. The bow was used in war at a later date than 1860, viz by the Japanese against the English at Surin Nosake, September 5, 1864. Nor did the Armada year see the last appearance of the English archer. A company of archers was raised for the expedition to the island of Rhé in 1627. There were archers among the Russian troops in the Crimea. Again, the relation of Finsbury Archers, the Hon. Artillery Company and the Royal Toxophilite Society requires restatement. In July 1676, William Wood, Marshal of the Finsbury Archers, was sent round with a paper, signed by Sir E. Hungerford and others, setting forth that the "officers and others of the Society of Archers, within the cities of London and Westminster" have determined "that the bearer shall have a silver badge and bear the same as Marshall to the Queen's Majesty's Regiment of Archers." The names of the subscribers were appended (Guildhall MSS. 193). Consequently this badge or shield had no connexion with Oxford. The Finsbury Archers became extinct about 1761, but the Royal Toxophilite Society was not founded until 1781, when Mr. P. Constable, the last captain of the Finsbury Archers, joined it and handed to it the shield and other valuables. There was, therefore, no combination of the two clubs in 1841. It is incorrect to assert that the Finsbury Archers were not connected with the Hon. Artillery Company. They were connected, and under their powers shot over the Finsbury Fields up to 1657. The Archers' Division of the Hon. Artillery Company was formed by members of the Royal Toxophilite Society in 1784. (X)

SPRING-RICE, SIR CECIL ARTHUR (1859-1918), English diplomatist, was born in London Feb. 27 1859, the second son of the Hon Charles Spring-Rice (1819-1870), sometime assistant under-secretary for foreign affairs, and grandson of the 1st Baron Montecagle. He was educated at Eton and Balliol College, Oxford, and entered the Foreign Office in 1882, becoming private secretary to Lord Granville in 1884 and précis writer to Lord Rosebery in 1885. He went to Washington as third secretary in 1886, and after various brief appointments went in 1895 to Berlin. In 1898 he became secretary at Teheran, and from there went in 1901 to Cairo as British commissioner on the Caisse de la Dette. In 1903 he went to St. Petersburg, first as secretary and later as councillor of embassy, remaining in Russia during the war with Japan of 1904-5 and the revolution of 1905. In 1906 he was sent to Persia as minister, having lately been created K.C.M.G., and his stay there coincided with the period of the delicate negotiations which preceded the signing of the Anglo-Russian agreement of 1907. In 1908 he was created G.C.V.O. and went to Sweden as minister, and in 1912 was appointed ambassador to the United States. Ill-health, however, prevented his undoubtedly brilliant capacity from making his work at all prominent during his tenure of this position. He died at Ottawa on his way home to England Feb. 14 1918. He married in 1904 Florence, daughter of Sir Frank Lascelles, and left two children.

SQUIRES, RICHARD ANDERSON (1880-), Newfoundland politician, was born at Harbour Grace, Newfoundland, Jan. 18 1880. He was educated at the Methodist College, St. John's, and Dalhousie University, Halifax. In 1902 he was admitted a solicitor, and in 1911 was called to the bar (K.C. 1914). In 1909 he entered the Legislature as Liberal member for the Trinity district, for which he sat until 1913. In 1914 he became Minister of Justice and Attorney-General, from 1914 to 1917 was a member of the Legislative Council, and from 1917 to 1918 Colonial Secretary. He was nominated leader of the Liberal party in Aug. 1910, and the same year became Prime Minister.

STAFF, MILITARY (see 25.752) —One result of the unqualified success which Prussian arms achieved in the wars of 1866 and 1870-1 was that the general staff principle, which had so largely contributed to give victory to the hosts controlled by von Moltke in those contests, was adopted by almost every military power during the last quarter of the 19th century. The exact nature of the arrangements necessarily varied in different countries, but the ideals sought after were the same. Thus in the different staff organizations as they were constituted in peace-time, work in connexion with devising plans for offensive operations and for ensuring territorial defence, duties dealing with the collection of military information, the superintendence of the education of officers, the conduct of manoeuvres and the training of troops, were kept as far as possible distinct from administration—"adjutantur," as the Germans call it. Before the year 1900 most armies possessed a general staff which was more or less in close touch with its Government on the one hand and, thanks to its ramifications, with the troops on the other.

Only two of the more important nations—the United Kingdom and the United States—adhered for all practical purposes to previously existing systems, under which preparation for war was relegated to the background in staff duties. It is true that in either state certain improvements were effected by the military authorities, tending towards ensuring that at least some of the functions properly performed by a general staff should be allocated to special branches of the staff, but, such as they were, they did not go very far. Then came the S. African War of 1899-1902. The difficulties and disappointments encountered by British military forces in that protracted struggle, coupled with the unsatisfactory working of the staff in the field (especially in its higher grades) during the progress of the operations, made plain the need of reform, and the War Office was considering the question of far-reaching modifications of the system in force when, in 1904, the Government suddenly set up a "War Office Reconstitution Committee" charged with the duty of reorganizing the central administration of the army. The committee recommended a number of drastic alterations, but by far the most im-

portant of its proposals was that a General Staff Department, which was to constitute the foremost branch of the professional side of the War Office, should be created forthwith out of certain existing sections, with entirely new sections superposed. The committee further urged that a general staff organization, acting under the aegis of, and in close touch with, the general staff in Whitehall, should be introduced into military districts and commands. The recommendations of the committee were accepted by the Government, and so it came about that a British general staff was established ten years before the outbreak of the World War. During those ten years remarkable progress was made, and when the nation was confronted by the tremendous emergency of Aug. 1914 it had at its disposition a body of well-trained general staff officers, sufficient for the comparatively small army that was available to take the field at the opening of hostilities, although totally insufficient to meet the requirements of the vast forces which had to be improvised after war had broken out. The Government of the United States was still later than that of the United Kingdom in establishing a general staff of the kind that Scharnhorst had thought of a century before. This was only set on foot in 1911, six years before the entry of the Republic into the great conflict which was to upset so many preconceived ideas on the subject of conducting war, but which was to prove—even more conclusively than had the Franco-German War and the Japanese triumphs of 1904-5—how imperative it is under modern conditions for a state which embarks upon a serious struggle with a foreign foe to have an efficient and suitably organized military staff at its command. Owing to the very small number of trained general staff officers that were available when the country became committed to hostilities on a vast scale, the U.S. forces were even worse equipped in this respect when they took the field in Europe than were those of the United Kingdom in their greatly expanded form.

The remarkable progress that has taken place in science of recent years has tended to impose some entirely new duties upon military staffs, brought about their expansion in certain directions, and even necessitated the creation of some entirely new branches as part of their organization. There is, for instance, in the first place that development in railway communications which has occurred in most civilized countries and in many possible and actual theatres of war, as also the contriving of numberless devices by which the construction of new lines of rail is facilitated during operations in the field. Then again there is the question of electric communications, which to-day play so conspicuous a part in war. Improvements in small arms and in ordnance have brought it about that the volume of ammunition needed for the weapons in the hands of troops has come to be out of all proportion to the amount which experience had proved to be ample in campaigns of the past. Developments in mechanical traction are giving this an ever-increasing military importance, not merely from the point of view of the supplying of armies but also from that of their tactical employment. The appearance of the tank on the battlefield is another feature of very recent date which tends to increase staff work. Finally, there is the establishment of air power which has introduced a factor of incalculable importance as affecting the control of belligerent armies; whether the combatant aeronautical service of a nation form part of its military organization or be independent, its operations in time of war impose duties upon military staffs such as had not to be performed by them in any contest previous to the World War. In some cases it is mainly the general staff that finds its labours increased by these modern developments, in other cases the new work falls rather upon the administrative staff. But in all cases both subdivisions of the staff are, at least to some extent, affected.

One most important duty which devolves upon the general staff in a State compelled by its geographical position and by political and international problems to maintain fighting forces both by sea and by land is the establishing and the maintenance of intimate relations with the naval authorities. Such conditions prevail in the case of most maritime nations, and, where this is so, it is imperative that the two services shall be capable of

effective coöperation in the event of war. Effective coöperation when an emergency arises can only be ensured if the military staff has been in close touch with the corresponding naval staff in time of peace. Much attention had fortunately been paid to this question in the United Kingdom during the period that intervened between the creation of the British general staff and the outbreak of the World War. Permanent contact existed between the thinking branches of the Admiralty and of the War Office. Problems which might possibly arise in the future had been examined by them in conference, principles of action had been laid down, details had been worked out, and to this is to be attributed the secrecy and the smoothness with which the British Expeditionary Force was transported across the Channel to France during the fortnight succeeding the declaration of war in 1914. Moreover, thanks to their being brought into contact at staff rides with naval officers and to the happy relations which existed between these two services, British general staff officers as a body had studied and were acquainted with naval doctrine and naval procedure, a great advantage when, as was the case at the Dardanelles, operations partook of an amphibious character. General staffs on the Continent did not, on the other hand, prove to be equally well-informed as to maritime conditions, this was made apparent during discussions such as often took place between military authorities representing the different Allies, concerning the policy which ought to be pursued in the Near East and other problems in which sea-power was necessarily involved. It is only natural, however, that a military staff which is representative of a sea-faring people should devote more attention to such subjects than will that of a non-maritime nation or of a nation possessing small maritime interests and limited maritime resources.

When a country elects to make of its air service a department of State distinct from the army, as has happened in the United Kingdom, it necessarily falls to the lot of the military general staff to maintain those intimate relations with the aerial general staff by which alone mutual coöperation can be secured in time of war. Under such circumstances the military general staff stands towards the air service as it does to the navy.

"War," said Clausewitz, "is only a continuation of State policy by other means," and elsewhere that "none of the principal plans which are required for a war can be made without an insight into the political relations." It was a recognition of this truth on the part of her Government that led to the triumphs of Prussia, first over Austria and then over France, in the days of von Moltke, the foremost professional interpreter of Clausewitz' doctrines. The executive in Berlin had during the middle decades of the 19th century been working hand in hand with the general staff. Sadowa and Sedan were the outcome. The history of the short-lived German Empire indicates that in later years a tendency made itself felt for the general staff to attempt to direct, and even partially to succeed in directing, the policy of the Government. A system of genuine militarism in its worst form began to creep in, which in due course brought untold disasters on the German people; but the passages quoted above from the great Prussian military writer do not inculcate anything of that kind. What they do inculcate is that there should be at all times an intimate understanding between what has been called the "brain of the army" and the civilian executive at the head of the State. The truth is that any Government which understands its business will always, when any question of a delicate nature arises between it and the rulers of some foreign Power, keep itself fully acquainted with the resources at command for enforcing its wishes should a quarrel supervene. If, moreover, the most is to be made of such fighting force as a country will dispose of in the event of finding itself in a state of belligerency with some neighbour, it is indispensable that the military—as also naval—authorities shall have made beforehand a study of the strategical situation that will, as far as can be foreseen, arise when hostilities break out. It is also indispensable that those authorities shall have been made aware in advance of the likelihood of the struggle's taking place. It is on the central directing branch of the general staff, i.e. on the General Staff Department

at the War Office in the case of the United Kingdom, as it was on the "Great General Staff" of the days of von Moltke and the German Empire, that devolves the duty of maintaining relations with the Government and of advising it regarding the military aspect of problems created by the international situation. That central directing branch of the general staff is entitled to expect that the Government shall keep it fully *au courant* with the political conditions of the day.

The merits of the doctrine preached by Clausewitz seem to be self-evident, but leaders of opinion in the United Kingdom were slow to realize its importance. There existed an almost unaccountable inability to perceive the dangers to which a State unprepared for emergencies is exposed. When a Royal Commission presided over by Lord Hartington virtually recommended the setting up of a general staff in 1889, one of its members, a prominent politician who at a later date came to be Prime Minister, actually—in one of the most fatuous documents ever written by a public man—objected to the proposal on the grounds that, owing to its peculiar position, Great Britain had no need to study possibilities of conflict in advance. With such ineptitude in influential quarters, the bitter experiences of the S. African War were required to awaken British statesmen to a realization of their responsibilities. The lessons of that contest were to some extent learnt. By the setting up of the Committee of Imperial Defence, in which professional opinion was given a powerful voice, some preliminary steps had been taken in the right direction even before the creation of the general staff in 1904, and, subsequent to that date, the general staff at the War Office has been constantly consulted by the British Government and has been kept well-informed on all points of importance connected with the international situation.

Now, as a matter of administration, the relations between the general staff and the executive are to be governed, and by what process communications between them are to be carried out, necessarily depends upon the political system in vogue in the state concerned. In any country possessing representative institutions the general staff can only be acting in a consultative capacity, at all events in peace-time. In the United Kingdom in the years preceding the World War the Chief of the Imperial General Staff and the Director of Military Operations were *ex-officio* members of the Committee of Imperial Defence. When strategical or administrative questions in which military force was or might be concerned were to be discussed by the committee, documents setting out the general staff view on the subject were laid before it by the general staff representatives. The decision of the committee on the points under discussion was taken and recorded, and executive action sometimes followed if it was involved by the decision. But although the more prominent members of the Government were included in it, the committee itself was merely a consultative body, and no executive action involving expenditure could follow on one of its decisions without the obtaining of at least nominal Cabinet sanction. Such recommendations were liable to be vetoed on account of the expense by the committee without reference to the Cabinet. Moreover, it did not necessarily follow that the view of the general staff would be accepted by the committee even on academical questions.

An interesting example of the working of the system is provided by the story of the Dardanelles. The expediency of an attack upon the Straits in the event of a war with Turkey was gone into by the committee as an academical question in 1906. The general staff were opposed to such a venture and the Admiralty representatives in the main agreed with them, the committee decided that the undertaking would in the event of a contest be inadvisable, and the result was that study of the subject on the part of the general staff virtually ceased. When early in the World War the project was brought up afresh by the First Lord of the Admiralty, the decision which the Committee of Imperial Defence had arrived at eight years before was ignored, and when the operations were undertaken their progress was hampered by lack of information, owing to the general staff's having acted on that decision and having to some extent abandoned research with regard to the topography, the resources and so forth of this

potential theatre of war. But experience proved that the general staff had been right.

When hostilities arise some instrument a good deal more effective than a consultative committee is needed to control conduct of the war, and, from Aug. 1914 to the date of the Armistice, the operations were, in the case of the United Kingdom, for the first two and a half years of the struggle under supreme charge of various forms of war council directly representative of the Cabinet and given a free hand by that body. They were later under supreme charge of the specially established War Cabinet. The general staff was practically always represented at the meetings of the war councils and of the War Cabinet, but purely in an advisory position without voting power. They were responsible to the council or the Cabinet for the advice they gave, but the council or the Cabinet was responsible to the country for accepting or rejecting that advice. It is true that as a result of somewhat peculiar conditions that held good in the early days of the struggle, attributable partly to the unique personality of Lord Kitchener and partly to the weakening of the general staff at the War Office when its cream was skimmed off and dispatched to the Continent, the influence of the brain of the army was not for a time exerted very effectually in the councils of the Government. But that was only a passing phase. At a later stage the general staff was always at least allowed to express its views, even if its opinion was not necessarily accepted.

As a matter of fact its opinion was occasionally ignored in questions of considerable importance. This was no doubt partly due to some want of confidence in its judgment felt in Government circles owing to the slow progress made towards victory, and partly due to the personality and the temperament of certain members of the Government itself. The general staff also must have been sometimes at fault on occasions when its advice was rejected, although, should the full facts ever be made known impartially, posterity will probably pronounce it usually to have been right. Still, a general staff, however well-organized it may be and however gifted and informed its personnel, is not infallible. That this is so was demonstrated in the protraction for years of the World War, whereas the British general staff had at the outset confidently reckoned on its only lasting some months. The German general staff, again, looked with contempt upon the huge forces that Lord Kitchener was known to be improvising, until the value of the British "New Armies" was proved up to the hilt in the field; and at a later stage of the struggle it totally miscalculated and underestimated the military potentialities of the United States. Moreover, all the European general staffs alike, in their forecasts made in time of peace, underrated the wastage in personnel and the expenditure in ammunition in a modern campaign on a great scale.

It has been said that a general staff must "think politically." If this maxim is merely to be taken as meaning that a general staff should appreciate political habits of thought, watch political tendencies, and keep itself acquainted with the political aspects of every question influencing military action alike in peace and in war, its truth is indisputable. But one of the most important duties falling to the lot of a general staff, especially in times of emergency, will often be to strive to prevent mere policy from adversely influencing the conduct of operations of war or affecting Government decisions in connexion with military subjects. History provides some striking examples of political considerations gravely prejudicing the prospects of armies in the field. MacMahon's fatal march to Sedan was a case in point. The retention of Gen. Penn Symons' advanced force at Glencoe in the opening days of the Natal campaign of 1899 furnishes another instance. Had the question at issue been regarded solely from the soldier's point of view, it is more than doubtful whether Gen. Townshend would ever have been launched on his ill-omened effort to reach Bagdad in Nov. 1915. When problems of this kind present themselves, a general staff will often have a difficult and delicate rôle to play. But the golden rule to govern its conduct on such occasions would seem to be that it ought to regard and present the problem from the fighting point of view alone. The politicians can look after the political side.

It cannot be too clearly understood that neither in the United Kingdom nor in any other military state does the staff of an army in reality consist of a general staff alone. There must always be what, for lack of a more distinctive nomenclature, is called in the British service its "administrative" side—although in point of fact many of the duties of a general staff are necessarily of an administrative character. It is indeed the case that, at least in peace-time, the administrative staff of an army is in a sense the more important of the two. The army has to be recruited and fed and clothed and equipped, and its discipline has to be maintained, otherwise there will be no troops for the general staff to dispose of and there will be no *raison d'être* for the general staff. Whereas the general staff will often in peace-time be engaged on work which in the event may prove of little profit, the administrative staff is constantly busy disposing of questions which if not dealt with will cause a collapse. Calling the administrative staff "*adjutantur*" may alter its status and may lower its dignity, but does not alter the fact that it is a staff and that it performs staff duties. The organization as affecting the administrative staff that was introduced into the War Office in the United Kingdom in 1904, and in due course extended throughout the army (the details of which have been touched upon in earlier paragraphs), worked extremely well both at headquarters and with the troops during the pre-war period, and it also gave good results when subjected to trial at manoeuvres between 1909 and 1914. The same staff organization was extended to India shortly after it came into force in the United Kingdom. Nor, when it came to be put to the test in warfare on a gigantic scale in many parts of the world, was it found wanting. Although the problems engaging the attention of the quartermaster-general's staffs and the inspector-general of communications' staffs were in many respects fundamentally the same in the Gallipoli Peninsula, in Mesopotamia, and in France and Flanders, the wide differences in the geographical and topographical conditions as between the three theatres of war obliged the problems to be solved on separate lines in each case. In France and Flanders several railways connected the troops at the front with the secure and well-equipped ports that acted as bases. In the Gallipoli Peninsula open beaches under fire served for bases, and the communications were to all intents and purposes maritime. For most of the time in Mesopotamia it was a case of an army dependent on one single line of river communication, hundreds of miles long, although the river was gradually to some extent supplemented by specially constructed sections of railway. And yet the organization of the administrative staff as it had been designed in peace-time met requirements under these diverse sets of circumstances. Where failures occurred, they were due to errors in execution or else to lack of essential resources. Such alterations as have recently been carried out as a result of the teachings of the World War have been in detail and not in principle.

The British plan subordinates the administrative staff to the general staff less than is the common practice. This is perhaps due to the nature of British campaigns of the 1874-1902 era, campaigns fought in regions often destitute of communications and always poor in resources. Almost everything hinged on supply and transport in these contests, and the transport generally had to be improvised on entirely new methods for each particular case. Losses in action were as a rule trifling as compared to losses from disease. For one thought that the commander or his chief advisers gave to the enemy, ten thoughts were given to communications. Instead of looking to the front they were generally looking to the rear. Duties such as are now apportioned to the administrative staff greatly outweighed in importance duties such as are now apportioned to the general staff. There was little difficulty in beating the enemy if only supplies could be got up to permit a fight. But, to whatever cause it may be attributable, the fact remains that the chief of the general staff of a British army nowadays is merely in the position of *primus inter pares* relatively to the adjutant-general and the quartermaster-general—and it is the same at the War Office. In almost all other armies, on the other hand, including that of the United States, the chief of the general staff is definitely chief

of the staff. And he also is usually called chief of the staff, the heads of different branches of the administrative staff being absolutely subjected to him. The "chief of the staff" plan was moreover adopted in the case of several British campaigns of modern date, e.g. that of 1882 in Egypt and Lord Wolseley's and Lord Kitchener's expeditions up the Nile in 1884-5 and 1898. A chief of the staff was appointed to Sir R. Buller at the outset of the S. African War (although owing to unforeseen events he never took up the post), and at a later date Lord Kitchener went out as chief of the staff to Lord Roberts.

If the existing British staff organization comes to be compared with those where the chief of the general staff is also chief of the staff, it will be found that there is something to be said on both sides. That part of the British system under which a command or a district is in peace-time supplied with a superior officer in charge of administration, to whom wide responsibilities are allowed and who is generally in practice senior to the principal general staff officer, permits the general in command to devote nearly the whole of his attention to preparing his troops for war. But that arrangement would be unworkable in the field. There the progress of operations is so dependent on the work of the administrative staff that the commander cannot transfer his authority in connexion with the latter to somebody else—as is recognized in the British staff organization in time of war by the heads of the adjutant-general and the quartermaster-general staffs, as well as the inspector of communications, then dealing direct with the commander. Still, the fact that a peace arrangement does not fit in with the requirements of war is not a conclusive argument against that arrangement's holding good in peace-time, which after all represents the normal condition of things, and the British plan of a chief of administration is only a special feature in a larger question. Objections do undoubtedly exist in peace-time to the supremacy of the chief of the general staff. That automatically makes him responsible for the work of the administrative staff, and as all manner of administrative problems—unimportant problems, perhaps, but problems which have to be solved—are constantly arising in peace-time, most of the chief of the general staff's time may come to be occupied with matters that are not general staff matters at all, and military policy, manœuvres, training of troops, higher instruction, defence schemes, and so forth, may suffer. But, if peace represents the normal state of affairs, armies none the less exist for purposes of war, and in time of war the case for the British system is not so strong.

In face of the enemy, operations—planning them, deciding whether the plan is feasible, and taking the necessary steps for their execution—are of paramount importance, but cannot be said actually to govern administration, for unless the army's establishments are maintained and unless it has its food, its ammunition, etc., it cannot carry out the operations. The success of the plan may in the main depend on strategical and tactical factors, but in framing the plan the duties which the administrative staff will have to perform in connexion with its execution must have been considered with meticulous care. It is for the administrative staff to say whether the plan is feasible from the point of view of supply, transport, depots, hospital service, and so forth. There may be great administrative difficulties in the way, which will as a matter of course be represented. It is, however, for the general staff to weigh the administrative as against the strategical aspects of the case and then lay the whole subject before the commander for a final decision. The British *Field Service Regulations* clearly admit by implication that the chief of the general staff is the superior of the adjutant-general, the quartermaster-general and the chief of communications, without their being actually under him. That, under conditions such as develop on active service, is apt to prove a somewhat clumsy arrangement and to give rise to friction. It is neither one thing nor the other. Granted that the "chief of the staff" system means centralization, granted that it demands from the chief of the general staff a somewhat closer acquaintance with purely administrative questions than would be necessary if the heads of the chief branches of the administrative staff were

virtually his equals, even granted that under it less of his time will be available for the consideration of the strategical and tactical situation than would otherwise be the case, the system does seem a more satisfactory arrangement for purposes of operations in the field than that which found favour in the British army after the setting up of the Army Council. Nor would it seem to follow as a matter of course that the "chief of the staff" system must not be adopted in war-time, simply because it does not obtain during peace. (C. E. C.)

STAMBOLIISKI, ALEXANDER (1879—), Bulgarian statesman, was born at Slavovitsa in Bulgaria Sept. 1 1879. He was of peasant origin, but obtained a good education at Sofia and then at Halle in Germany. In 1902 he became editor of the newspaper of the Agrarian League and later entered the *Sobranje*. He soon acquired great influence among the peasants, and from the first took up an attitude of fearless opposition to King Ferdinand's policy. In 1908 Stamboliiski headed the Agrarian protest against the Declaration of Independence, as being in the interest of the dynasty rather than of the people. In 1911 he made a violent speech in the Grand *Sobranje*, opposing the amendment to the constitution by which the King was given the right to make secret treaties, and in 1913 he openly accused the King of having brought about the calamitous war with Serbia. On Sept. 17 1915 Stamboliiski accompanied the other leaders of the Opposition to the palace, and, in a forcible speech and later in personal conversation, he warned the King with characteristic *brusquerie* that if he again plunged the country into war it would end in disaster and that he would lose his throne, if not his head. Stamboliiski was then condemned to imprisonment for life, and was kept in strict and painful confinement from Sept. 30 1915 for three years; he was, however, allowed access to books and spent much of his time in study and writing. On Sept. 25 1918, when imminent catastrophe compelled Bulgaria to seek an armistice, he was released, and, after a stormy interview with the King, went to the front, where a revolutionary movement among the troops was developing. He returned with the insurrectionary troops to Sofia, and order was restored only after much loss of life; Stamboliiski was obliged to go into hiding, even after the King's abdication. The Government, however, soon realized that his help was essential in the critical state of the country, and he became Minister of Public Works in Todorov's Cabinet. Although the Agrarians had not an actual majority after the election of Aug. 1919, Stamboliiski became President of the Council and Minister for Foreign Affairs; on Nov. 27 he had the courage to sign the Treaty of Neuilly on behalf of his country. In April 1920 the Cabinet was reconstructed, Stamboliiski remaining as Premier, Minister for War and of Foreign Affairs in a Cabinet composed entirely of his own followers.

STANFORD, SIR CHARLES VILLIERS (1852—), Irish musical composer (see 25773), published in 1911 *Musical Compositions*; three years later appeared *Pages from an Unwritten Diary* and in 1916 *A History of Music*, written in conjunction with his former pupil, Cecil Forsyth. In later years his music included the operatic piece *The Critic* (op. 144), produced by Beecham in 1916, and *The Travelling Companion* (op. 146), which won a Carnegie award in 1917, but had not yet been produced in 1921. In 1919 his symphony *L'Allegro ed Il Penseroso* also won a Carnegie award, and in 1921 his setting of a poem by Mr. Justice Darling entitled *At the Abbey*—the point being the burial of the Unknown Warrior in the Abbey—was produced by the Royal Choral Society in the Albert Hall. Stanford's *Songs of the Fleet*, originally produced in 1910, gained great popularity, and he also composed much chamber music.

STANMORE, ARTHUR HAMILTON HAMILTON-GORDON, 1ST BARON (1820-1912), British administrator, was born Nov. 26 1820, the youngest son of the 4th Earl of Aberdeen. He was educated at Cambridge and afterwards entered politics, becoming private secretary to the Prime Minister, Lord Derby, from 1852 to 1855, and sitting as member for Beverley from 1854 to 1857. He was successively governor of Trinidad (1866-70), Mauritius (1871-4), Fiji (1875-80), New Zealand (1880-2) and Ceylon (1883-90). He was raised to the peerage in 1895, and

died in London Jan. 30 1912. He was succeeded by his son, George Arthur Maurice Hamilton-Gordon, born Jan. 3 1871, who in 1916 was appointed lord-in-waiting to King George V.

STEAD, WILLIAM THOMAS (1840-1912), English journalist (*see* 25 817), was drowned on the "Titanic" April 15 1912.

STEED, HENRY WICKHAM (1871-), English journalist, was born at Long Melford, Suffolk, Oct. 10 1871, the son of a local solicitor, and was educated at Sudbury grammar school and the universities of Jena, Berlin and Paris. From 1896 to 1913 he acted continuously as foreign correspondent to *The Times*, beginning in Berlin, passing on to Rome, where he remained five years (1897-1902), and thence to Vienna (1902-13). His *Hapsburg Monarchy* (1913, 4th ed. 1918) is recognized as the most illuminating work that has been written on Austria-Hungary. In 1914 he became foreign editor (in London) of *The Times*, and in Feb. 1919 was appointed to succeed Mr. Geoffrey Dawson as editor. During the World War he was a prominent supporter of the Yugoslav movement. In 1918 under Lord Northcliffe he was engaged on propagandist work in the enemy countries, and he headed a special mission to Italy in March and April of that year. His other publications include *The Socialist and Labour Movement in England, Germany & France* (1894); *L'Angleterre et la Guerre* (1915); *L'Effort Anglais* (1916); *La Démocratie Britannique* (1918).

STEER, P. WILSON (1860-), English painter (*see* 25 868), exhibited after 1886 practically the whole of his work at the New English Art Club, in whose formation he took a leading part and of which he was at one time president. His earlier work, such as the "Boulogne Sands" showed the influence of impressionism in its feeling for light and its handling of colour, but after 1895 he adopted a more sober palette, at times using strong black shadows with silvery lights, and gave increased attention to design. After 1900 he returned to the use of a full range of pigment, and produced some of his finest work, such as "Richmond after Storm" (1903) and "The Isle of Purbeck" (1909). In later years he only used the impressionist colour analysis to a very limited extent, and generally worked within a chosen and limited colour scheme. His feeling for colour harmony and power of rendering subtle variations in tone relate him to Gainsborough (a likeness well exemplified in "The Beaver Hat"), and give his work its characteristic quality. Most typical perhaps are his landscapes, mainly wide stretches of country with broken skies, full of light, atmosphere and a sense of space, but he also produced many portraits and figure compositions, his paintings of the nude being marked by great appreciation of the character and quality of flesh. His later work includes "A Summer Evening" (1914), "Painswick Beacon" (1916), "The Vale of Gloucester" (1917), "Chirk Castle" (1917), and a considerable group of water-colours, very delicately and directly handled. A self portrait is in the Uffizi Gallery, Florence, and he is represented in the Tate Gallery, the Municipal Gallery, Dublin, and the Johannesburg Gallery.

STEFÁNSSON, VILHJÁLMMUR (1870-), Canadian explorer, was born at Arnes, Manitoba, Nov. 3 1870, of Icelandic parentage. He was educated at the universities of North Dakota and Iowa, and afterwards at Harvard. He became a newspaper reporter, but later was appointed to an instructorship of anthropology at Harvard, and became deeply interested in the problems of the Arctic regions. He made a private expedition to Iceland in 1904, and the following year returned with a Harvard archaeological expedition. He visited the Eskimo of northern Alaska (1906-7), and in 1908 started on a four years' expedition to the Arctic shores of Canada under the auspices of the Geological Survey of Canada and the American Museum of Natural History, with interesting results. In 1913 Stefánsson was appointed commander of the Canadian Arctic expedition which sailed from Victoria, B.C., in June of that year to explore the northern shores of Canada and Alaska. In 1914, with two companions, he crossed Beaufort Sea on the moving ice from Martin Point, Alaska, to the north-western corner of Banks I.; in 1915 he visited the sea west of Prince Patrick I. and discovered more land to the north; and in 1916 discovered land west of Axel

Heiberg Island. The following year he travelled, again over moving ice, as far as lat. 80° 30' N. and long. 112° W. The expedition returned to Canada in 1918 (*see* ARCTIC REGIONS). Stefánsson published *My Life with the Eskimo* (1913), *The Friendly Arctic* (1921) and an anthropological report on the expedition of 1908-12, besides many articles in scientific journals. He received many honours from learned societies.

STEIN, SIR (MARK) AUREL (1862-), British archaeologist, was born at Budapest Nov. 26 1862. Educated in the public schools of Budapest and Dresden and afterwards at the universities of Vienna and Tübingen, where he studied Oriental languages and antiquities, he went to England for further study and then to India, where he became principal of the Oriental College, Lahore, and registrar of the Punjab University in 1888. Eleven years later he was appointed to the Indian Education Service, and for the next two years carried out archaeological explorations for the Indian Government in Chinese Turkestan. In 1906-8 he made further explorations (*see* 27.425) in central Asia and western China, receiving the gold medal of the Royal Geographical Society. From 1909 he was superintendent of the Indian Archaeological Survey, and in 1913-6 carried out explorations in Persia and central Asia, described by him in the *Geographical Journal* (1916). He was created K.C.I.E. in 1912. His other publications include *Chronicle of Kings of Kashmir* (1900); *Ancient Kholan* (1907) and *Ruins of Desert Cathay* (1912).

STEVENSON, ADLAI EWING (1835-1914), American political leader (*see* 25.007), died at Chicago June 13 1914.

STEWART, JULIUS L. (1855-1919), American painter (*see* 25.014), died in Paris Jan. 4 1919.

STEYN, MARTINUS THEUNIS (1857-1916), Dutch S. African politician (*see* 25.015). After the prominent share which he took in the work of the S. African National Convention in 1909-10 ex-President Steyn retired into private life at his farm, Onze Rust (Our Rest), near Bloemfontein. From this retirement he never emerged till his death Nov. 28 1916, except to address occasional meetings of the Dutch people of S. Africa on topics of national interest. Yet this almost complete retirement from public activities did nothing to lessen his influence with his own people. It cannot be said that this influence was exercised to promote racial peace in S. Africa. When the dissension between Gen. Botha, the first Prime Minister of the Union of S. Africa, and Gen. Hertzog began to shake the frame of the Ministry, ex-President Steyn might have had a decisive influence in composing that difference, which was ultimately to break Gen. Botha's Cabinet and to lead to long dissension among the Dutch-speaking people of S. Africa. His weight, however, was thrown without reserve on the Hertzog side. The ideas of ex-President Steyn were the ideas of Kruger. He held with tenacity the creed of the Boer who regarded himself as the holder of S. Africa by a species of divine right, who resented the intrusion of the British element, and was determined to treat that element as intruders and "foreign adventurers." Beyond doubt they were sincere, if narrow. He held, as Kruger had held, and as Gen. Hertzog held, that the intrusion of the British element involved a descent into the muddy waters of commercialism, the strife of contending ideas and embroilment in the tangles of world-politics.

STINNES, HUGO (1870-), German industrialist and financier, was born at Mulheim on Feb. 12 1870. He was the son of Hugo Stinnes, and grandson of Matthias Stinnes, who was the founder of a firm in no great way of business at Mulheim in the Ruhr district. After passing his leaving examination from a *Realschule*, young Stinnes was placed in an office at Coblenz where he speedily picked up the elements of a business training. In order to get a practical knowledge of mining he worked for a few months as a miner at the Wiethe colliery. He then, in 1889, attended a course of instruction at the Academy of Mining in Berlin. In the following year he entered the firm which his grandfather had founded. He remained there only two years and then established a firm of his own, Hugo Stinnes, Ltd. The whole original share capital was 50,000 marks (pre-war = £2,500). Gradually, from dealing in coal, he became

of the staff. And he also is usually called chief of the staff, the heads of different branches of the administrative staff being absolutely subjected to him. The "chief of the staff" plan was moreover adopted in the case of several British campaigns of modern date, e.g. that of 1882 in Egypt and Lord Wolseley's and Lord Kitchener's expeditions up the Nile in 1884-5 and 1898. A chief of the staff was appointed to Sir R. Buller at the outset of the S. African War (although owing to unforeseen events he never took up the post), and at a later date Lord Kitchener went out as chief of the staff to Lord Roberts.

If the existing British staff organization comes to be compared with those where the chief of the general staff is also chief of the staff, it will be found that there is something to be said on both sides. That part of the British system under which a command or a district is in peace-time supplied with a superior officer in charge of administration, to whom wide responsibilities are allowed and who is generally in practice senior to the principal general staff officer, permits the general in command to devote nearly the whole of his attention to preparing his troops for war. But that arrangement would be unworkable in the field. There the progress of operations is so dependent on the work of the administrative staff that the commander cannot transfer his authority in connexion with the latter to somebody else—as is recognized in the British staff organization in time of war by the heads of the adjutant-general and the quartermaster-general staffs, as well as the inspector of communications, then dealing direct with the commander. Still, the fact that a peace arrangement does not fit in with the requirements of war is not a conclusive argument against that arrangement's holding good in peace-time, which after all represents the normal condition of things, and the British plan of a chief of administration is only a special feature in a larger question. Objections do undoubtedly exist in peace-time to the supremacy of the chief of the general staff. That automatically makes him responsible for the work of the administrative staff, and as all manner of administrative problems—unimportant problems, perhaps, but problems which have to be solved—are constantly arising in peace-time, most of the chief of the general staff's time may come to be occupied with matters that are not general staff matters at all, and military policy, manœuvres, training of troops, higher instruction, defence schemes, and so forth, may suffer. But, if peace represents the normal state of affairs, armies none the less exist for purposes of war, and in time of war the case for the British system is not so strong.

In face of the enemy, operations—planning them, deciding whether the plan is feasible, and taking the necessary steps for their execution—are of paramount importance, but cannot be said actually to govern administration, for unless the army's establishments are maintained and unless it has its food, its ammunition, etc., it cannot carry out the operations. The success of the plan may in the main depend on strategical and tactical factors, but in framing the plan the duties which the administrative staff will have to perform in connexion with its execution must have been considered with meticulous care. It is for the administrative staff to say whether the plan is feasible from the point of view of supply, transport, depots, hospital service, and so forth. There may be great administrative difficulties in the way, which will as a matter of course be represented. It is, however, for the general staff to weigh the administrative as against the strategical aspects of the case and then lay the whole subject before the commander for a final decision. The British *Field Service Regulations* clearly admit by implication that the chief of the general staff is the superior of the adjutant-general, the quartermaster-general and the chief of communications, without their being actually under him. That, under conditions such as develop on active service, is apt to prove a somewhat clumsy arrangement and to give rise to friction. It is neither one thing nor the other. Granted that the "chief of the staff" system means centralization, granted that it demands from the chief of the general staff a somewhat closer acquaintance with purely administrative questions than would be necessary if the heads of the chief branches of the administrative staff were

virtually his equals, even granted that under it less of his time will be available for the consideration of the strategical and tactical situation than would otherwise be the case, the system does seem a more satisfactory arrangement for purposes of operations in the field than that which found favour in the British army after the setting up of the Army Council. Nor would it seem to follow as a matter of course that the "chief of the staff" system must not be adopted in war-time, simply because it does not obtain during peace. (C. E. C.)

STAMBOLIISKI, ALEXANDER (1879—), Bulgarian statesman, was born at Slavovitsa in Bulgaria Sept. 1 1879. He was of peasant origin, but obtained a good education at Sofia and then at Halle in Germany. In 1902 he became editor of the newspaper of the Agrarian League and later entered the *Sobranje*. He soon acquired great influence among the peasants, and from the first took up an attitude of fearless opposition to King Ferdinand's policy. In 1908 Stamboliiski headed the Agrarian protest against the Declaration of Independence, as being in the interest of the dynasty rather than of the people. In 1911 he made a violent speech in the Grand *Sobranje*, opposing the amendment to the constitution by which the King was given the right to make secret treaties, and in 1913 he openly accused the King of having brought about the calamitous war with Serbia. On Sept. 17 1915 Stamboliiski accompanied the other leaders of the Opposition to the palace, and, in a forcible speech and later in personal conversation, he warned the King with characteristic *brusquerie* that if he again plunged the country into war it would end in disaster and that he would lose his throne, if not his head. Stamboliiski was then condemned to imprisonment for life, and was kept in strict and painful confinement from Sept. 30 1915 for three years; he was, however, allowed access to books and spent much of his time in study and writing. On Sept. 25 1918, when imminent catastrophe compelled Bulgaria to seek an armistice, he was released, and, after a stormy interview with the King, went to the front, where a revolutionary movement among the troops was developing. He returned with the insurrectionary troops to Sofia, and order was restored only after much loss of life; Stamboliiski was obliged to go into hiding, even after the King's abdication. The Government, however, soon realized that his help was essential in the critical state of the country, and he became Minister of Public Works in Todorov's Cabinet. Although the Agrarians had not an actual majority after the election of Aug. 1919, Stamboliiski became President of the Council and Minister for Foreign Affairs; on Nov. 27 he had the courage to sign the Treaty of Neuilly on behalf of his country. In April 1920 the Cabinet was reconstructed, Stamboliiski remaining as Premier, Minister for War and of Foreign Affairs in a Cabinet composed entirely of his own followers.

STANFORD, SIR CHARLES VILLIERS (1852—), Irish musical composer (see 25773), published in 1911 *Musical Compositions*; three years later appeared *Pages from an Unwritten Diary* and in 1916 *A History of Music*, written in conjunction with his former pupil, Cecil Forsyth. In later years his music included the operatic piece *The Critic* (op. 144), produced by Beecham in 1916, and *The Travelling Companion* (op. 146), which won a Carnegie award in 1917, but had not yet been produced in 1921. In 1919 his symphony *L'Allegro ed Il Penseroso* also won a Carnegie award, and in 1921 his setting of a poem by Mr. Justice Darling entitled *At the Abbey*—the point being the burial of the Unknown Warrior in the Abbey—was produced by the Royal Choral Society in the Albert Hall. Stanford's *Songs of the Fleet*, originally produced in 1910, gained great popularity, and he also composed much chamber music.

STANMORE, ARTHUR HAMILTON HAMILTON-GORDON, 1ST BARON (1820-1912), British administrator, was born Nov. 26 1820, the youngest son of the 4th Earl of Aberdeen. He was educated at Cambridge and afterwards entered politics, becoming private secretary to the Prime Minister, Lord Derby, from 1852 to 1855, and sitting as member for Beverley from 1854 to 1857. He was successively governor of Trinidad (1866-70), Mauritius (1871-4), Fiji (1875-80), New Zealand (1880-2) and Ceylon (1883-90). He was raised to the peerage in 1895, and

panned by the flotation of a number of companies, particularly in Russia, where the Maikop field for a time attracted much attention. But in comparison with rubber, oil did not provide the same opportunities for the company promoter, and the flotation of companies for the exploitation of oil-fields, known and unknown, was comparatively limited. The oil boom lasted approximately 10 years, when a reaction set in. But meanwhile huge fortunes were made. Bonus shares were issued in great numbers by the principal oil companies, and this, together with high dividends, kept public interest at a high level.

With the exception of the oil market, stock markets were in a depressed condition for some time before the outbreak of war.

The War Period—Early in July 1914, rumours of war began to affect the Continental bourses. On July 13 the Vienna market was demoralized by fear of hostilities, but it was not until July 24, when the terms of the Austrian ultimatum to Serbia were made known, that the London market became seriously perturbed. From that date until Friday July 31, when the London Stock Exchange Committee for General Purposes decided to close the House for an indefinite period, markets were inundated with a vast flood of selling orders from home and abroad, and excitement was intense. The European bourses virtually ceased to function, and this diverted an enormous stream of foreign selling orders to London. Inter-bourse securities naturally suffered a very heavy decline. On Monday July 27 many London jobbers ceased to "make prices." This was "general carry over" day, and the difficulties to be met by speculators were formidable. The settlement, however, was completed on Wednesday July 29, without any very serious disaster, though 9 failures, involving 20 members, were announced. Dealing, however, had become a matter of negotiation entirely, and on Thursday July 30 1914 the House opened for the last time that year. During the first two hours no attempt was made to do business, and the next morning the committee decided not to reopen the House until further notice. On Monday July 27 four consecutive transactions in consols were officially recorded at prices showing a movement of $\frac{1}{2}$ between each bargain, a circumstance without precedent in modern London Stock Exchange history. During the closed period, business, despite official discouragement, was not entirely suspended. A certain amount of dealing, on a strictly cash basis, was found to be possible. On Sept. 14 the committee fixed minimum prices for trustee stocks, based on the quotations ruling on July 30, the object being to prevent disastrous depreciation. The New York Stock Exchange similarly made minimum prices for American shares, and these values were adopted by the London committee. The maintenance of these prices was insisted upon by the banks, which had undertaken to continue their loans against securities without asking for any additional margin.

Meanwhile the question of dealing with the uncompleted mid-August account was taken in hand on the London Stock Exchange and completed on Nov. 19, a special set of rules governing its arrangement. The gist of these rules was that bulls of stock carried over on July 27 should put up a 5% margin on high-class securities, and 10% on others, and pay interest fortnightly, or alternatively pay a higher rate of interest in lieu of margin. The "taker in" was put under the obligation of continuing to "take in" stock at July 27 prices until 12 months after the war, or the expiring of the Courts (Emergency Powers) Act, 1914, whichever event was the sooner. The declaration of a moratorium, which was continued until Nov. 4 1914, made it impossible to reopen the Stock Exchange for some months. About £90,000,000 had been borrowed against securities before the war began, and it was not until the moratorium came to an end that the mid-August settlement was carried through. The affairs of a small number of members were in this operation wound up under the liquidation rule, but the amount of stock carried over under the temporary regulations was smaller than had been feared. As stocks rose to the mean price of July 27 they had to be taken up or sold. On Dec. 23 1914 the conditions governing the reopening of the London Stock Exchange were promulgated. The minimum price list was then extended to

include inter-bourse securities. Minimum prices were gradually abolished as liquidation ceased and prices settled down to the new level of investment values. On July 3 1916 the last of the minimum prices were removed.

The London Stock Exchange was reopened for the first time after the outbreak of war on Jan. 4 1915. Severe restrictions were placed upon the transaction of business, in accordance with arrangements made in Dec. 1914, between the Committee for General Purposes and the Treasury. These arrangements were embodied in Temporary Regulations which were substituted for the old regulations governing Stock Exchange practice. All bargains had to be done on a cash basis. The suspension of virtually all speculative business was the most important innovation introduced by the Temporary Regulations. Normally, speculation forms the great bulk of business effected on the Stock Exchange, and its temporary abolition deprived many members of their occupation. The volume of business which it was possible to do was further restricted by two other features of the Regulations—namely, the "physical possession" rule, which prohibited dealings in stock that had not been in physical possession in the United Kingdom since Sept. 1914, and the fixing of minimum prices for trustee and other securities, which were in nearly every case the mean prices on July 27. Both of these rules were relaxed to some extent during 1915; the former to facilitate sales of American securities held in Allied and neutral states, and to allow sales of colonially held stock. When they were established, minimum prices undoubtedly served a very valuable purpose, but when the issue of high-yielding war loans completely altered the standard of investment, as regards the yield in interest, no useful purpose was served by them. The retention of minimum prices fixed on a pre-war basis of credit made it impossible to deal in the securities affected, and that was the reason for their removal. But the absence of speculation naturally caused a considerable reduction in membership. On the day of reopening the number of transactions was less than 1,000. On subsequent occasions the number rose to well over 3,000 per day, but in 1915 the daily average was nearer 2,000 than 3,000. A heavy loss of revenue was sustained by the company owning the Stock Exchange, and in 1915 it failed to distribute an interim dividend.

The arrangement by which all stocks carried over at the outbreak of war were continued until after the end of the war, unless the "end of July 1914" prices were reached, worked well in practice, thanks largely to the American demand for securities, and the "open" position on the London Stock Exchange, which in Aug. 1914 was about 90 millions sterling, had been reduced by the end of 1915 to about 20 millions.

With the reopening of the London Stock Exchange an important reform was introduced which was continued after the cessation of hostilities. The Temporary Regulations provided that every bargain should be recorded. This practice was much preferred by the public to the pre-war custom of marking only occasional bargains. The absence of buying and selling prices, dealers being prohibited from offering stock in the market, was one of the reasons for the compulsory marking of all bargains. This reform led to the issue of a supplementary list of bargains in securities not quoted in the daily "official" list. Thus, from Jan. 4 1915 onwards, a complete record of business done was furnished by the two lists, on the authority of the committee. Another innovation was the retention in the lists of prices of previous bargains, which added to their value to the public.

The course of prices in 1915 and subsequent war years was generally downward. In June-July 1915 the flotation of the unlimited 4½% British Government War Loan made a lowering of investment values inevitable. This for a time checked business in the stocks protected by minima, and caused a heavy fall in other fixed interest-bearing securities. In March 1915 minimum prices were reduced to a small extent. The minimum for Consols was reduced from 68½ to 66½ prior to the issue of the 4½% War Loan, and it was removed later when the great bulk of the stock had been converted into the 4½% stock. The market for American securities was very active and strong throughout 1915, and

prices showed a substantial advance on the year. The war-time prosperity in the United States caused a great demand for American securities held in the United Kingdom and France. European holders were encouraged to sell by the appreciation of the dollar in terms of sterling, which enabled a profit on exchange to be made. In the second half of the year the British Government bought large quantities of American securities held in the United Kingdom and sold them in the United States in order to provide itself with means of making payment for munitions, etc. (see DOLLAR SECURITIES MOBILIZATION). It is estimated that in this year about 150 millions sterling of American securities were transferred to the United States. Towards the end of 1915 the Government ceased operations in the market, and invited holders either to sell or loan approved securities to it. Thus came into force what was subsequently known as the Dollar Securities Mobilization Scheme. The terms of purchase were approximately the parity of the New York price, and for loan a bonus of $\frac{1}{2}\%$ per annum in addition to the interest or dividend on the loaned security, plus a premium of $2\frac{1}{2}\%$ in the event of the Government exercising its right to sell the stock loaned to it. The Temporary Regulations were made more stringent as the war continued, but 1917 witnessed a check to the depreciation of fixed interest-bearing securities for the first time since the S. African War of 1899-1902, and also a sustained upward movement in industrial securities.

The following table, compiled from figures published by the *Bankers' Magazine*, shows the course at different important dates of investment values since the calculations were first made. The values relate to 387 representative securities—

Jan. 1907	£1,843,000,000
*July 20 1914	£3,371,000,000
†Nov. 1918	£2,822,000,000
Dec. 1919	£2,634,784,000
Dec. 1920	£2,319,777,000

*Pre-war †Month of Armistice

The general depreciation was due not only to the exceptionally heavy demand for money to carry on the war, but also to the growing burden of direct taxation in the United Kingdom. For a time the British investor showed a marked preference for industrial securities, on which high dividends were paid together with, in many cases, bonuses either in the form of cash or scrip. Bonus shares were created and issued by a large number of concerns. The scarcity of capital caused a steady rise in the rate of interest, and first-class companies found it necessary to pay 8% and even more on new debentures and preference capital. The Treasury scheme for buying and borrowing dollar securities in 1916 was followed in 1917 by a scheme for requisitioning those which had been neither lent nor sold. This put the finishing touch to the process which had begun in 1915, of extinguishing the American market in London.

Throughout the war period the London Stock Exchange Co. had a very lean revenue. Receipts, which in 1914-5 amounted to £296,757, dwindled to £130,304 in 1917-8, and the dividend dropped to £1 per share.

A feature of the year 1918 was the advance in foreign Government securities, especially those of neutral nations. Bonds of the neutral countries were bought for exchange purposes, and they changed hands up to extraordinarily high figures in the first half of the year. Spanish 4's touched 135 at one time, owing to the rise in the sterling value of the peseta, and Swedish $3\frac{1}{2}\%$ stock rose to 115, through appreciation in kroner.

Calculations made by the *Bankers' Magazine* show that the values of 387 representative securities fell during 1919 from £2,801,089,000 to £2,634,784,000, a decrease of £166,605,000, equal to 5.9 per cent. (As on July 20 1914, the total was £3,371,000,000, the decline in the five and a half years to Dec. 1919 was no less than £736,216,000, or nearly 22 per cent.) At one time during the war the values touched £2,572,000,000. This was on April 20 1918—at the height of the Germans' last great offensive effort. It is interesting to note that in Jan. 1907, when the valuations began, the total was £3,843,000,000. The valuation at the end of 1919 showed a net shrinkage of £1,208,000,000, or 31½%, of

which £736,216,000 was due to conditions brought about by the war. The war-time depreciation in fixed interest-bearing securities was greater than this. Taking the values of 108 fixed interest-bearing securities we find that the total on July 20 1914 was £1,989,000,000, at the close of 1918 £1,575,000,000, and at the end of 1919 £1,378,006,000. On the other hand, the value of 279 speculative investments, i.e. the dividends on which fluctuate according to profits, was £1,382,000,000 on July 20 1914, at the close of 1918 £1,226,000,000, and at the end of 1919 £1,255,578,000. Thus there was a net depreciation in fixed interest-bearing securities of £610,004,000, or 30%, in the whole war period, of which £106,004,000 occurred in 1919; while speculative investments showed an increase of £29,578,000 in value during 1919, or 2.4%, but a net depreciation of £126,422,000 on the whole period, or 9 per cent.

After the War.—In spite of marked activity in speculative investments, the year 1919 witnessed a generally downward tendency in prices of securities, with the result that a large part of the appreciation which took place in the closing months of 1918, following the collapse of Germany's war effort, was lost. The reaction was due in a large measure to heavy Government expenditure, bringing with it the pressure of high taxation, and an adverse American exchange, the former involving a continuance of heavy borrowing, and the latter a rise in the Bank of England rate from 5 to 6% at the beginning of Nov. 1919. The failure of the British Government's Funding Loan operation in the summer had an adverse effect on the market for gilt-edged investments, and the City of London received something like a shock on learning that national expenditure in the second half of the year was scarcely distinguishable in amount from that of a large part of the war period. Markets, however, presented a generally animated appearance. This was in part due to the return of warrior members. Attention was mainly concentrated on speculative securities, notably oil, brewery, insurance, shipping, S. African gold, and commercial and industrial securities. Fixed interest-bearing securities were persistently neglected, owing to the higher value of money and the competition of numerous new issues offering yields as high as 9 per cent. In the summer of 1919, various war-time restrictions were removed from the London Stock Exchange with the approval of the Treasury. The removal of the embargo on exports of capital enabled foreign-held stocks to be realized in the London market; but arbitrage transactions continued to be prohibited. Some of the declarations which had to accompany each transaction were abolished, but the temporary regulation prohibiting any but cash transactions was retained.

Gold-mining shares made a substantial advance in the closing months of 1919 owing to the high premium received on gold under an arrangement come to in July for restoring free conditions to the market for gold newly produced. This enabled the companies to declare larger dividends in Dec., and rescued a large number of low-grade mines from imminent bankruptcy. Towards the close of 1919 Rand Mines shares were introduced on the New York market, this being the first time that S. African gold shares were listed in Wall Street. The diamond companies enjoyed a wonderful prosperity during the year, the De Beers Co.'s revenue amounting to as much as one whole day's war expenditure at the maximum level. Record dividends were paid, and share quotations reached unprecedented figures.

The year 1920 was the most remarkable of the early post-war period. At the beginning markets in London were extraordinarily active, owing to the boom in trade. The oil market was in a state of ceaseless activity, and other speculative markets felt some of the reflected glory of inflated oil profits. Nomination for membership of the London Stock Exchange rose in price to £650, but was almost unsaleable at the end of the year. There was a great congestion of work in brokers' offices in the early months, and they were kept open until late at night for several weeks. But the introduction of a British budget of £1,200 millions, with its unpleasant reminder of the burden of taxation, administered a check to the reckless buoyancy of markets. The collapse of the exchanges of all the countries except the United States

Sweden, Switzerland and Holland, caused a steady stream of liquidation in London from the Continent, which grew in volume when, later in the year, a heavy fall occurred in wholesale commodity prices. The fall in commodities forced traders to realize securities. The pressure to obtain money to finance production and distribution and pay taxes caused persistent liquidation in the gilt-edged market, and British Government securities fell to a level giving a return of well over 6% per annum. In Dec. 1920 the leading stocks, in some cases, touched the lowest points on record. The 5% War Loan fell to 81½, Victory Bonds to 70½, Funding Loan to 65½, and Consols to 43½. The *Bankers' Magazine* calculations of the prices of 381 representative securities in Dec. 1920 showed a fall in values of no less than £315,000,000, the largest loss ever recorded in one year. British and Indian funds fell in value in 1920 by 11.9%, foreign Government stocks by 18.8%, home railway stocks by 17.3%, foreign Government stocks by 23.5 per cent. The decline in commercial and industrial securities was much greater, the percentage being 40.9. The severity of this reaction was, of course, due to the sudden collapse of the six-year-old boom in trade. Iron and steel shares suffered a depreciation of 33.7%, shipping securities of 21.7%, and S. African mining shares of 39.2 per cent. The losses of the investor were so severe that he lost all interest in speculative stocks and turned his attention to gilt-edged stocks. This brought about a steady recovery in the latter in the first half of 1921. The issue of foreign Government loans in London, which was suspended on the outbreak of war, was renewed in 1921, when a loan to the São Paulo Government was issued, followed by an issue of Norwegian Government bonds.

American and Foreign Stock Exchanges—The shock of the World War caused stock markets all over the world to shiver and collapse more or less. By custom London was a market to which every bourse abroad turned for help when there was any pressure, and for a period of at least a fortnight after the middle of July 1914 the London market was called upon to absorb a flood of selling orders from every mart in Europe where securities were dealt in. While the European bourses had to all intents and purposes suspended business by the beginning of the week ended Aug. 1, there was a fairly free market for securities in London in the great majority of international securities down to the middle of the week. The news of the coming war affected the European bourses early in July. On the 13th of that month the Vienna market was described as having become quite demoralized by the fear of war. The Berlin bourse reflected this nervousness because Germany was Austro-Hungary's chief lender, Government and municipal loans of the Habsburg Empire being held in Germany to the extent, it was estimated, of over £200,000,000. On Monday July 27, the day before the declaration of war by Austria, the panic in Vienna was such that the bourse was ordered to be closed for three days. Subsequent events showed it was destined to be closed for an indefinite period. The Brussels market followed the lead of Vienna, ceasing business on July 27, and the Paris *coulisse*, or outside unofficial market, also suspended operations on that day. On Tuesday July 28, before the declaration of war by Austria had become known, dealings became very difficult. On July 29 all account dealings in Berlin were suspended, transactions being confined to cash bargains. The Amsterdam and St. Petersburg bourses were entirely closed that day, while on Thursday all markets suspended business except London, Berlin, Paris and New York, but the settlement in Paris fixed for July 31 was postponed. Business on the Berlin bourse was ordered to be suspended on the following day (July 31), though the bourse was kept open. The Paris market remained open throughout that day, July 31, but only six quotations were available out of some sixty stocks and shares usually quoted in reports from that centre. The Paris bourse was the only stock-market to keep open its doors after Thursday July 30. But this bourse is under the direct control of the Government, and the authority of the Government was no doubt responsible for the bourse being kept open. Down to Sept. 2 a few quotations were forthcoming from Paris, but on that day the bourse was shut until further notice owing to the

approach of the Germans to the French capital. The New York Stock Exchange was open on Tuesday July 28, when the news of the declaration of war by Austria first became known, and it was called upon to withstand the first shock of that announcement. By the end of the day's session it was found that transactions for the first time that year (1914) had exceeded one million shares. On Tuesday July 28 the Toronto Stock Exchange was closed, after being open for 10 minutes, and business on the Montreal market ceased in the afternoon. On July 30 violent breaks in prices occurred on the New York Exchange, but there was at all times a market. The next day, however, the committee decided to follow the lead of London and to close the Exchange.

New York.—In the latter part of 1912 there was a serious decline in American securities, owing to selling from Europe brought about by the Balkan War, but as soon as this unloading ceased the market was much unsettled by the decision of the Supreme Court of the United States ordering the dissolution of the Union Pacific-Southern Pacific merger. Down to the beginning of the World War New York had shown a tendency to develop more and more as a market for international securities, though very little was actually done to encourage foreign securities to seek a market there. In the short and frantic period in the last few days of July 1914 bankers saw ordinary standards of value scattered to the winds and loans aggregating \$2,000,000,000 imperilled almost in a night. When the House was closed special committees were set up to undertake the stupendous task of straightening out the apparently hopeless tangle of contracts outstanding when operations were suspended.

The New York Stock Exchange tentatively opened its doors again on Nov. 28 1914, for trading in bonds only. As the experience was encouraging, the committee decided to reopen the House for regular trading on Dec. 13. Minimum prices had been fixed by the committee on Oct. 13, and trading in unlisted securities was resumed on the following day. The minimum prices were revised from time to time and abolished on March 31 1915, owing to a rise in quotations having rendered minima no longer necessary. Then began the most remarkable era in the history of the Exchange. In point of feverish activity and wild fluctuations in prices, the year 1915 was then without precedent. Million-share days, sensational advances, and equally sensational declines, were common occurrences. Price movements were very erratic. The most conspicuous feature of the enormous volume of trading was the participation by the outside public seldom if ever before witnessed on the New York Exchange. Under clique and pool manipulation, prices were whirled upward with startling rapidity. Stocks which led the advances were those of companies which, it was supposed, would benefit most largely from war orders. Throughout the year there was heavy buying of both stocks and bonds by investors and financial interests of the first rank. Many securities reacted from their highest levels before the close of the year, but others, on good business prospects, retained the greater part of their phenomenal rise. Even more remarkable was 1916. Activity was intense, and prices rose to exceptionally high figures. Every dollar security offered from Europe was eagerly snapped up.

The following year witnessed a reaction. The depreciation in the market value of American railway securities was estimated at \$3,000,000,000—about one billion in bonds and two billions in shares. The principal causes of this great shrinkage in the market value of railway securities, in which about one-twelfth of the wealth of the United States was invested, were reported to be as follows:—

- (1) Enormous destruction of capital in the war, with unprecedented Government loans at rising rates of interest.
- (2) The liquidation by Europe of about \$1,700,000,000 of American railroad securities in payment for munitions of war.
- (3) A rapid advance in the cost of railroad materials and labour, with no compensating advance in railroad rates, and fear on the part of investors that the Government would not promptly raise rates to maintain railroad property and credit.

When the U.S. Government declared war, the composure and strength of the Stock Exchange was an impressively favour-

prices showed a substantial advance on the year. The war-time prosperity in the United States caused a great demand for American securities held in the United Kingdom and France. European holders were encouraged to sell by the appreciation of the dollar in terms of sterling, which enabled a profit on exchange to be made. In the second half of the year the British Government bought large quantities of American securities held in the United Kingdom and sold them in the United States in order to provide itself with means of making payment for munitions, etc. (see DOLLAR SECURITIES MOBILIZATION). It is estimated that in this year about 150 millions sterling of American securities were transferred to the United States. Towards the end of 1915 the Government ceased operations in the market, and invited holders either to sell or loan approved securities to it. Thus came into force what was subsequently known as the Dollar Securities Mobilization Scheme. The terms of purchase were approximately the parity of the New York price, and for loan a bonus of $\frac{1}{2}\%$ per annum in addition to the interest or dividend on the loaned security, plus a premium of $2\frac{1}{2}\%$ in the event of the Government exercising its right to sell the stock loaned to it. The Temporary Regulations were made more stringent as the war continued, but 1917 witnessed a check to the depreciation of fixed interest-bearing securities for the first time since the S. African War of 1899-1902, and also a sustained upward movement in industrial securities.

The following table, compiled from figures published by the *Bankers' Magazine*, shows the course at different important dates of investment values since the calculations were first made. The values relate to 387 representative securities—

Jan. 1907	£1,843,000,000
*July 20 1914	£3,371,000,000
†Nov. 1918	£2,822,000,000
Dec. 1919	£2,634,784,000
Dec. 1920	£2,319,777,000

*Pre-war †Month of Armistice

The general depreciation was due not only to the exceptionally heavy demand for money to carry on the war, but also to the growing burden of direct taxation in the United Kingdom. For a time the British investor showed a marked preference for industrial securities, on which high dividends were paid together with, in many cases, bonuses either in the form of cash or scrip. Bonus shares were created and issued by a large number of concerns. The scarcity of capital caused a steady rise in the rate of interest, and first-class companies found it necessary to pay 8% and even more on new debentures and preference capital. The Treasury scheme for buying and borrowing dollar securities in 1916 was followed in 1917 by a scheme for requisitioning those which had been neither lent nor sold. This put the finishing touch to the process which had begun in 1915, of extinguishing the American market in London.

Throughout the war period the London Stock Exchange Co. had a very lean revenue. Receipts, which in 1914-5 amounted to £296,757, dwindled to £130,304 in 1917-8, and the dividend dropped to £1 per share.

A feature of the year 1918 was the advance in foreign Government securities, especially those of neutral nations. Bonds of the neutral countries were bought for exchange purposes, and they changed hands up to extraordinarily high figures in the first half of the year. Spanish 4's touched 135 at one time, owing to the rise in the sterling value of the peseta, and Swedish $3\frac{1}{2}\%$ stock rose to 115, through appreciation in kroner.

Calculations made by the *Bankers' Magazine* show that the values of 387 representative securities fell during 1919 from £2,801,089,000 to £2,634,784,000, a decrease of £166,605,000, equal to 5.9 per cent. (As on July 20 1914, the total was £3,371,000,000, the decline in the five and a half years to Dec. 1919 was no less than £736,216,000, or nearly 22 per cent.) At one time during the war the values touched £2,572,000,000. This was on April 20 1918—at the height of the Germans' last great offensive effort. It is interesting to note that in Jan. 1907, when the valuations began, the total was £3,843,000,000. The valuation at the end of 1919 showed a net shrinkage of £1,208,000,000, or 31½%, of

which £736,216,000 was due to conditions brought about by the war. The war-time depreciation in fixed interest-bearing securities was greater than this. Taking the values of 108 fixed interest-bearing securities we find that the total on July 20 1914 was £1,989,000,000, at the close of 1918 £1,575,000,000, and at the end of 1919 £1,378,006,000. On the other hand, the value of 279 speculative investments, i.e. the dividends on which fluctuate according to profits, was £1,382,000,000 on July 20 1914, at the close of 1918 £1,226,000,000, and at the end of 1919 £1,255,578,000. Thus there was a net depreciation in fixed interest-bearing securities of £610,004,000, or 30%, in the whole war period, of which £106,004,000 occurred in 1919; while speculative investments showed an increase of £29,578,000 in value during 1919, or 2.4%, but a net depreciation of £126,422,000 on the whole period, or 9 per cent.

After the War.—In spite of marked activity in speculative investments, the year 1919 witnessed a generally downward tendency in prices of securities, with the result that a large part of the appreciation which took place in the closing months of 1918, following the collapse of Germany's war effort, was lost. The reaction was due in a large measure to heavy Government expenditure, bringing with it the pressure of high taxation, and an adverse American exchange, the former involving a continuance of heavy borrowing, and the latter a rise in the Bank of England rate from 5 to 6% at the beginning of Nov. 1919. The failure of the British Government's Funding Loan operation in the summer had an adverse effect on the market for gilt-edged investments, and the City of London received something like a shock on learning that national expenditure in the second half of the year was scarcely distinguishable in amount from that of a large part of the war period. Markets, however, presented a generally animated appearance. This was in part due to the return of warrior members. Attention was mainly concentrated on speculative securities, notably oil, brewery, insurance, shipping, S. African gold, and commercial and industrial securities. Fixed interest-bearing securities were persistently neglected, owing to the higher value of money and the competition of numerous new issues offering yields as high as 9 per cent. In the summer of 1919, various war-time restrictions were removed from the London Stock Exchange with the approval of the Treasury. The removal of the embargo on exports of capital enabled foreign-held stocks to be realized in the London market; but arbitrage transactions continued to be prohibited. Some of the declarations which had to accompany each transaction were abolished, but the temporary regulation prohibiting any but cash transactions was retained.

Gold-mining shares made a substantial advance in the closing months of 1919 owing to the high premium received on gold under an arrangement come to in July for restoring free conditions to the market for gold newly produced. This enabled the companies to declare larger dividends in Dec., and rescued a large number of low-grade mines from imminent bankruptcy. Towards the close of 1919 Rand Mines shares were introduced on the New York market, this being the first time that S. African gold shares were listed in Wall Street. The diamond companies enjoyed a wonderful prosperity during the year, the De Beers Co.'s revenue amounting to as much as one whole day's war expenditure at the maximum level. Record dividends were paid, and share quotations reached unprecedented figures.

The year 1920 was the most remarkable of the early post-war period. At the beginning markets in London were extraordinarily active, owing to the boom in trade. The oil market was in a state of ceaseless activity, and other speculative markets felt some of the reflected glory of inflated oil profits. Nomination for membership of the London Stock Exchange rose in price to £650, but was almost unsaleable at the end of the year. There was a great congestion of work in brokers' offices in the early months, and they were kept open until late at night for several weeks. But the introduction of a British budget of £1,200 millions, with its unpleasant reminder of the burden of taxation, administered a check to the reckless buoyancy of markets. The collapse of the exchanges of all the countries except the United States

on a capital of £9,000,000, and a group of leather companies paid 10% on an average. All the German war loans were, however, listed by special instruction at the price of issue. In 1917 there was again considerable speculation on the bourses, with generally rising prices, but the intervention of the United States in the war caused a set-back. At the end of 1917 the listing of prices was resumed, but publication of prices was strictly prohibited. German 3% stock rose 7 to 8 points, and there was a strong demand for industrials. Between Sept and Dec 1918 the quotations of German securities on the German markets fell so heavily that German financial writers estimated the decrease in capital value at about 50 per cent. Meanwhile Germany witnessed her foreign credit—such as it was—go to pieces. This was proved not only by the price of the mark, but by an almost universal desire in neutral countries to withdraw outstanding credits to Germany. The index figures prepared by the *Frankfurter Zeitung* showed the following (a representing values of 24 of the principal shipping, mining and dyeing concerns; b, of 10 important munitions, metal, petroleum and potash concerns. The table shows the effect of speculation before the German collapse, then a heavy fall, followed by a slight recovery at the end of 1918):—

	July 28 1914	Dec. 31 1917	Aug. 31 1918	Dec. 5 1918	Dec. 31 1918
a.	185	278	272	151	164
b.	232	445	442	177	197½

Amsterdam.—The Amsterdam Stock Exchange, which was closed on the outbreak of war in 1914, was reopened on Feb. 9 1915. Business at first was not very extensive, except in shipping and home industrial shares. Foreign stocks were very weak in 1915 owing to persistent selling from Germany. The year 1916 was a record of remarkable fluctuations, and at the close all kinds of shares showed enormous gains. The largest improvement took place in the securities of home industrial concerns, which made huge profits, as the result of the elimination of German competition. The Dutch Indian plantation companies made enormous profits, especially the sugar plantations, which sold a great part of their output to the British Government at high prices. Rubber and tobacco shares also improved in value. Royal Dutch shares were introduced for the first time on the American market in 1916. In 1917 the stock markets were rather quiet. Russian stocks fell enormously in the last months in consequence of the stoppage of interest payments, and the announcement that the Bolshevik Government would cancel the national debt. This latter step could only mean a serious financial disaster for Holland, where Russian stocks had found a ready market as being thoroughly sound investments. The total Dutch ownership of Russian stocks of State as well as private railways was estimated at 1,500,000,000 to 2,000,000,000 florins. New shipping shares amounting to 27,500,000 florins in face value were added to the market in 1917. In the following year the tendency was irregular, and sometimes weak, directly owing to the German collapse, but towards the end of the year prices rose again. Large new issues were made by shipping, plantation, and trading companies.

Vienna and Budapest.—In the early years of the war there was extravagant speculation on the Vienna and Budapest bourses, and prices rose to extraordinary heights on the enormous profits on paper made by all the industries of the country. But a heavy collapse succeeded the military breakdown in 1918, and the subsequent break-up of the old Empire.

Switzerland.—Following the example of the chief foreign bourses, the Basle and Zurich Stock Exchanges suspended operations towards the end of July 1914. The Geneva and Lausanne bourses, however, remained open even during August. On Jan. 7 1915 the Basle Stock Exchange resumed the publication of its daily price list. A further step forward was taken on Dec. 1 1915, and on April 25 1916 the bond market was reopened in its entirety. On June 26 transactions were extended to the full pre-war list. The Zurich bourse restarted official business on May 15 1916. (C. J. M.)

STOKER, BRAM (1847–1912), Irish author, was born in Dublin Nov. 8 1847 and was educated at a private school there

and at Trinity College. He entered the Irish civil service, to which his father also belonged, and wrote critical articles for various newspapers. He was called to the English bar, but in 1878 he joined Sir Henry Irving at the Lyceum theatre and was for many years his secretary and finally his biographer. He wrote a number of novels, of which *Dracula* (1897) was the best known, as well as *Personal Reminiscences of Sir Henry Irving* (1906). He died in London April 20 1912.

STOLYPIN, PETER ARCADEVICH (1863–1911), Russian statesman, was born in 1863, the son of Admiral Stolypin by his wife, a princess of the house of Gorchakov. He was educated at the university of St. Petersburg, and in 1884 entered the Government service. In 1902 he was appointed governor of Grodno, and in 1905 was transferred to Saratov, where he became known as a firm administrator. In 1906 he was recalled to take up the position of Minister of Internal Affairs, and in July of the same year succeeded Goremykin as Minister President. His career as Premier is described in the article *RUSSIA*. His firm and repressive policy toward all kinds of sedition caused him to be regarded as a deadly enemy by the revolutionary party, and many attempts upon his life were made. In Aug. 1906 a bomb was exploded at his summer residence, which seriously injured one of his daughters, but all efforts to kill him proved vain until 1911, when he was shot in a theatre at Kiev on Sept. 14, before the eyes of the Imperial family, by a Jew named Mordka Bogrov. The minister died of his wounds Sept. 18 1911.

STONE, MARCUS (1840–1921), English painter (see 25.957), died in London March 24 1921.

STONE, MELVILLE ELIJAH (1848–), American journalist, was born at Hudson, Ill., Aug. 22 1848. His father was a Methodist minister, of New York birth, who had moved to Illinois in early life and combined his activities as a circuit-preacher with the running of various small businesses, including book-selling and printing. He had English, Scottish and Irish blood in his veins, the Stone family having settled in New England in the 17th century. In 1860, when Melville was 12, his father was made pastor of a Methodist church in Chicago, and it was there that he got his schooling. In 1864 he began work as a newspaper reporter, but after sundry journalistic experiences he was set up in business in 1868 as proprietor of an iron-foundry and machine-shop, which incidentally made a specialty of the supply of folding theatre-chairs, etc. In the great Chicago fire of 1871 this was destroyed, and Stone was then for some time occupied in the administrative work of municipal relief and reconstruction after the fire. But in 1872 he again took up journalism, as one of the editors of the *Chicago Republican* (subsequently *Inter-Ocean*), and later of the *Post and Mail*, becoming for several years a political correspondent at Washington. At the end of 1875, having returned to Chicago, he and a colleague started a new Chicago paper, the evening *Daily News* (see 10.571), and, after he had obtained the help of a new partner in Victor F. Lawson as its manager, their venture soon became increasingly prosperous. In 1878 he and Lawson bought out the *Post and Mail*, and in 1881 they established the *Morning News* (later *Record* and *Record-Herald*). In 1888 Stone's interest was bought out by Lawson, and he retired, taking a prolonged holiday in Europe. Returning to Chicago in 1891, he took to banking by the foundation of the Globe National Bank, of which he became president, and he kept up this connexion for about ten years, but meanwhile pressure was put on him to take part in the reorganization of the Associated Press, then already a well-known news-agency, and in 1893 he accepted the position of general manager. In this capacity Melville Stone became even more prominent and powerful in the journalistic world than he had been as a Chicago editor and newspaper proprietor. At that time the Associated Press was still struggling (see 10.547) with its competitor, the United Press, but its enterprise now received a new stimulus, and by 1897, under Stone's management, and as subsequently reorganized in 1901, its service knew no rival. Stone had intimate relations with all the leading men of his time and played an important part in the publicity given to events and movements. He held this position until

prices showed a substantial advance on the year. The war-time prosperity in the United States caused a great demand for American securities held in the United Kingdom and France. European holders were encouraged to sell by the appreciation of the dollar in terms of sterling, which enabled a profit on exchange to be made. In the second half of the year the British Government bought large quantities of American securities held in the United Kingdom and sold them in the United States in order to provide itself with means of making payment for munitions, etc. (see DOLLAR SECURITIES MOBILIZATION). It is estimated that in this year about 150 millions sterling of American securities were transferred to the United States. Towards the end of 1915 the Government ceased operations in the market, and invited holders either to sell or loan approved securities to it. Thus came into force what was subsequently known as the Dollar Securities Mobilization Scheme. The terms of purchase were approximately the parity of the New York price, and for loan a bonus of $\frac{1}{2}\%$ per annum in addition to the interest or dividend on the loaned security, plus a premium of $2\frac{1}{2}\%$ in the event of the Government exercising its right to sell the stock loaned to it. The Temporary Regulations were made more stringent as the war continued, but 1917 witnessed a check to the depreciation of fixed interest-bearing securities for the first time since the S. African War of 1899-1902, and also a sustained upward movement in industrial securities.

The following table, compiled from figures published by the *Bankers' Magazine*, shows the course at different important dates of investment values since the calculations were first made. The values relate to 387 representative securities—

Jan. 1907	£1,843,000,000
*July 20 1914	£3,371,000,000
†Nov. 1918	£2,822,000,000
Dec. 1919	£2,634,784,000
Dec. 1920	£2,319,777,000

*Pre-war †Month of Armistice

The general depreciation was due not only to the exceptionally heavy demand for money to carry on the war, but also to the growing burden of direct taxation in the United Kingdom. For a time the British investor showed a marked preference for industrial securities, on which high dividends were paid together with, in many cases, bonuses either in the form of cash or scrip. Bonus shares were created and issued by a large number of concerns. The scarcity of capital caused a steady rise in the rate of interest, and first-class companies found it necessary to pay 8% and even more on new debentures and preference capital. The Treasury scheme for buying and borrowing dollar securities in 1916 was followed in 1917 by a scheme for requisitioning those which had been neither lent nor sold. This put the finishing touch to the process which had begun in 1915, of extinguishing the American market in London.

Throughout the war period the London Stock Exchange Co. had a very lean revenue. Receipts, which in 1914-5 amounted to £296,757, dwindled to £130,304 in 1917-8, and the dividend dropped to £1 per share.

A feature of the year 1918 was the advance in foreign Government securities, especially those of neutral nations. Bonds of the neutral countries were bought for exchange purposes, and they changed hands up to extraordinarily high figures in the first half of the year. Spanish 4's touched 135 at one time, owing to the rise in the sterling value of the peseta, and Swedish $3\frac{1}{2}\%$ stock rose to 115, through appreciation in kroner.

Calculations made by the *Bankers' Magazine* show that the values of 387 representative securities fell during 1919 from £2,801,089,000 to £2,634,784,000, a decrease of £166,605,000, equal to 5.9 per cent. (As on July 20 1914, the total was £3,371,000,000, the decline in the five and a half years to Dec. 1919 was no less than £736,216,000, or nearly 22 per cent.) At one time during the war the values touched £2,572,000,000. This was on April 20 1918—at the height of the Germans' last great offensive effort. It is interesting to note that in Jan. 1907, when the valuations began, the total was £3,843,000,000. The valuation at the end of 1919 showed a net shrinkage of £1,208,000,000, or 31½%, of

which £736,216,000 was due to conditions brought about by the war. The war-time depreciation in fixed interest-bearing securities was greater than this. Taking the values of 108 fixed interest-bearing securities we find that the total on July 20 1914 was £1,989,000,000, at the close of 1918 £1,575,000,000, and at the end of 1919 £1,378,006,000. On the other hand, the value of 279 speculative investments, i.e. the dividends on which fluctuate according to profits, was £1,382,000,000 on July 20 1914, at the close of 1918 £1,226,000,000, and at the end of 1919 £1,255,578,000. Thus there was a net depreciation in fixed interest-bearing securities of £610,004,000, or 30%, in the whole war period, of which £106,004,000 occurred in 1919; while speculative investments showed an increase of £29,578,000 in value during 1919, or 2.4%, but a net depreciation of £126,422,000 on the whole period, or 9 per cent.

After the War.—In spite of marked activity in speculative investments, the year 1919 witnessed a generally downward tendency in prices of securities, with the result that a large part of the appreciation which took place in the closing months of 1918, following the collapse of Germany's war effort, was lost. The reaction was due in a large measure to heavy Government expenditure, bringing with it the pressure of high taxation, and an adverse American exchange, the former involving a continuance of heavy borrowing, and the latter a rise in the Bank of England rate from 5 to 6% at the beginning of Nov. 1919. The failure of the British Government's Funding Loan operation in the summer had an adverse effect on the market for gilt-edged investments, and the City of London received something like a shock on learning that national expenditure in the second half of the year was scarcely distinguishable in amount from that of a large part of the war period. Markets, however, presented a generally animated appearance. This was in part due to the return of warrior members. Attention was mainly concentrated on speculative securities, notably oil, brewery, insurance, shipping, S. African gold, and commercial and industrial securities. Fixed interest-bearing securities were persistently neglected, owing to the higher value of money and the competition of numerous new issues offering yields as high as 9 per cent. In the summer of 1919, various war-time restrictions were removed from the London Stock Exchange with the approval of the Treasury. The removal of the embargo on exports of capital enabled foreign-held stocks to be realized in the London market; but arbitrage transactions continued to be prohibited. Some of the declarations which had to accompany each transaction were abolished, but the temporary regulation prohibiting any but cash transactions was retained.

Gold-mining shares made a substantial advance in the closing months of 1919 owing to the high premium received on gold under an arrangement come to in July for restoring free conditions to the market for gold newly produced. This enabled the companies to declare larger dividends in Dec., and rescued a large number of low-grade mines from imminent bankruptcy. Towards the close of 1919 Rand Mines shares were introduced on the New York market, this being the first time that S. African gold shares were listed in Wall Street. The diamond companies enjoyed a wonderful prosperity during the year, the De Beers Co.'s revenue amounting to as much as one whole day's war expenditure at the maximum level. Record dividends were paid, and share quotations reached unprecedented figures.

The year 1920 was the most remarkable of the early post-war period. At the beginning markets in London were extraordinarily active, owing to the boom in trade. The oil market was in a state of ceaseless activity, and other speculative markets felt some of the reflected glory of inflated oil profits. Nomination for membership of the London Stock Exchange rose in price to £650, but was almost unsaleable at the end of the year. There was a great congestion of work in brokers' offices in the early months, and they were kept open until late at night for several weeks. But the introduction of a British budget of £1,200 millions, with its unpleasant reminder of the burden of taxation, administered a check to the reckless buoyancy of markets. The collapse of the exchanges of all the countries except the United States

at Harrow Up to 1865 he engaged in journalism, but was then called to the bar and soon worked up an extensive practice, especially at the Central Criminal Court, London. He sat in the House of Commons as Conservative member for Shrewsbury from 1870 to 1874, and from 1870 to 1892 he was a judge of the High Court of Judicature at Allahabad. He was knighted on retirement, and four years later he returned to journalism as editor of the *Pall Mall Gazette*. He retired in 1909, and died in London June 4 1914.

STRAITS (DARDANELLES AND BOSPORUS).—The waterway formed by the Dardanelles, the Sea of Marmora and the Bosphorus, which connects the Mediterranean and the Black Sea, has possessed marked political importance from the earliest times. This importance, however, grew with increasing rapidity during the 20th century. The increase of population, the growth of commerce, the construction of railways, and the rise of nations in the basin of the Black Sea, enormously added to the political and military significance of the Straits. And while these factors gained in weight yearly, the Ottoman Empire, which held the guardianship of the Straits, declined yearly in vigour and strength. Correspondingly, it became more and more the object of national intrigue and ambition on the part of foreign Powers, whose designs would benefit were they in a position to control the Straits themselves.

These matters received forcible illustration during the World War. Problems having their origin in the existence of the Straits became then of supreme importance, even to the extent of prolonging or shortening the period of war. At the Peace Conference, too, questions of the Straits became acute. The seaborne commerce of the 100 million inhabitants occupying the basin of the Black Sea must perforce pass through the Straits. By railway communication with central Asia this region, too, is concerned with control of the Straits. The traditional Russian ambition for a warm water port looked to Constantinople and the Straits for fulfilment; and in 1915 the Powers in alliance with Russia accepted the Russian claim to the great position. Apart from Russia and Turkey, three states—Georgia, Rumania and Bulgaria—had a coast-line confined to the Black Sea, and therefore depend upon the Straits as the one route for their maritime trade with the outer seas. To Germany, control of the Straits in war by her ally Turkey meant the isolation and strangling of her enemies, Russia and Rumania. In fact the closing of the Straits at this time had much to do with the collapse of Russia, the outbreak of the revolution, and the prolongation of the war. With such possibilities and interests hanging upon them, the Peace Conference dealt comprehensively with the Straits in the Treaty of Sèvres. Under this treaty they were thrown open to all navigation in peace and war, without distinction of flag, and blockade of these waters was prohibited. An International "Commission of the Straits" was established to control the waterway. And still further to ensure that military interruption should not take place, a demilitarized "Zone of the Straits" was created, embracing all adjoining coastal territory. Within this area all military works and fortifications were to be razed, and the construction of similar works was forbidden.

(W. J. C.*)

STRAITS SETTLEMENTS AND DEPENDENCIES (see 25.986*).—The resident pop. of the Straits Settlements proper, according to the census of 1911, was 705,405, divided as follows. Singapore, 303,321; Penang, 141,550; Province Wellesley, 128,078; Malacca, 124,081; the Dindings, 7,466. Males outnumbered females nearly as 2 to 1. Included also in the Government of the Straits Settlements are Labuan (pop. in 1911, 6,546), Christmas Island (1,369) and the Cocos Islands (749).

In Labuan and Cocos Islands males did not greatly outnumber females, but in Christmas Island, with an almost wholly labouring pop., males were 1,328 and females 41.

In 1919 the pop. of the whole colony was estimated at 827,719. That of Christmas I. was 514 on Jan. 1 and 617 on Dec. 31.

In the colony the birth-rate in 1919 was 30.3 per thousand. The death-rate, which was 46.45 per thousand in 1911, fell to 29.15 in 1918, rose, with an epidemic of influenza, to 43.85 in 1918, and was 33.94 in 1919. The principal causes of death in the last year were

infant diseases (5,848) and malaria (4,623), and the other most serious maladies as returned were tuberculosis, beri-beri, pneumonia, and dysentery, but probably many deaths were due primarily to influenza. The epidemic of this disease resulted in the revival, after 30 years, of the native *wang-kang* ceremony at Malacca, in which a model boat is constructed in a temporary temple, and is subsequently burnt as a sacrifice to some supposedly neglected god.

Principal nationalities and religions were shown by the census as follows. —

Nationalities				
	Chinese	Malay	Indian	Europ. and Amer
Straits Setts proper	366,765	235,762	81,928	7,276
Labuan	1,799	4,434	—	34
Christmas I.	1,252	44	—	19
Cocos Is.	—	668	—	39
Religions				
	Chinese	Mahomedan	Hindu	Christian
Straits Setts proper	359,760	261,154	52,579	24,474
Labuan	—	4,430	—	116
Christmas I.	—	46	—	32
Cocos Is.	—	669	—	50

* Other than Mahomedan and Christian.

Chinese immigrants in 1919 numbered 70,912—21.4% more than in 1918, and 73.6% less than in the "record" year, 1911. Adult males were 62.4% and females 19.5%. 101,433 immigrants arrived at Penang from southern India, and 46,767 Indians quitted the colony. There were 2,439 labourers from Netherlands India.

The Chinese community was on the whole prosperous during the World War, the increased cost of living and the high rate of exchange with China bore hardly upon the poorer classes, but the increase of wages in great measure counterbalanced these disadvantages. The Chinese freely supported patriotic and charitable funds, and after some demur, before its purpose was fully understood, recognized without further difficulty the war-tax ordinance of 1917. The war, however, produced its problems for the community. It was necessary to establish a censorship of Chinese newspapers, and in June 1919 an anti-Japanese boycott resulted in rioting in Singapore and Penang, while a Chinese patriotic league and an anarchical body, the so-called Truth Society, gave some trouble.

Finance.—Revenue in 1911 amounted to \$11,409,220, in 1919 to \$34,108,465, expenditure in 1911 to \$9,085,389, in 1919 to \$34,901,231 (\$1 = 25.4d). A noteworthy financial measure was the introduction of an income tax, which, in spite of controversy, raised £400,000 sterling in 1917 without friction.

The colony had at the end of 1919 a debt of £6,913,352 sterling in respect of the loan raised by the issue of 3½% Straits Settlements inscribed stock, 1907. About four-fifths of this loan was expended on account of the Singapore Harbour Board, and the rest on account of the Penang Harbour Board, the municipal commissioners of Singapore and Penang, and on Government harbour works, and interest charges are borne by these bodies.

Among Government monopolies that of opium is by far the most productive; the sales of *chandu* in the colony in 1919 yielded \$17,511,220, in addition to which there were sales to the Federated and Non-Federated Malay States and Brunai. But prices were raised and other measures were taken in that year with a view to the gradual reduction of the amount of opium consumed.

Economic conditions: Agriculture, etc.—In many respects the colony actually benefited from the World War: there was, for instance, an increase in the gross value of trade from £63,600,000 in 1914 to £148,200,000 sterling in 1917. The more serious economic problems were not all results of the war. For example, it was about 1909-10 that a remarkable development of agricultural activity set in, especially in Malacca and Province Wellesley. This took the direction mainly of rubber planting, which led to the neglect of fruit cultivation and other forms of native agriculture, and this tendency has persisted. It has been asserted, indeed, that the rubber industry has been overexploited here: the people ceased in great measure to cultivate their own food crops and raise their own live stock, and became dependent on imported food stuffs. In 1917 rice was imported from Rangoon, Siam, and French Indo-China; wheat flour from Australia and India; cold storage foodstuffs from Australia, and other foodstuffs from China. Difficulties connected with shortage of supplies and shipping made it necessary to set up food control in 1917. An enquiry was instituted into measures for increasing home produce of rice and other foods, and "cultivation clauses" were inserted into leases of newly alienated lands. In 1918 the United States restricted imports of rubber, with a consequent reaction upon the Straits Settlements industry. This could not, however, immediately affect food cultivations, and in that year shortage in India, floods in Siam, and the demand for imported rice in Java and

* These figures indicate the volume and page number of the previous article.

Japan caused serious conditions in the Straits Settlements. Siam prohibited export of rice in July 1919. the Straits Settlements controller took entire charge of import and wholesale dealing, and a food production department was established which fostered home planting, and in spite of many difficulties it was found possible, early in 1920, to ensure supplies for several months. The Governments of the Straits Settlements, Netherlands India, and Ceylon agreed in 1919 to purchase through a single agent to avoid competition.

The cultivation and yield of coco-nuts declined in and after 1917, and the destruction of palms to make room for rubber had advanced so far in Singapore and Province Wellesley that an enactment was directed against it. Copra prices, however, rose in 1919. The clove, nutmeg, gambier, and areca nut industries of Penang shared in the general decline of cultivations which had become subsidiary to that of rubber. The pineapple cultivation was affected by the difficulty of obtaining tin plate for the canning industry. As for live stock (of which mention has been made above) a report for 1917 showed that whereas in 1910 Malacca exported 12,000 pigs, in the later year that number was imported, and that the former large export of poultry from Penang was more than balanced by import.

Forestry.—Measures have been taken to amalgamate the forest services of the Straits Settlements and the Federated Malay States, the first step being taken in 1918, when the forests of Malacca were placed under the deputy conservator of forests for Negri Sembilan. The area of reserved forests in 1920 was 107,270 ac., about 11% of lands in the colony. The mangrove industry has been fostered by imposing a control over cutting, and by replanting, over 2,000,000 seedlings having been planted in Penang and the Dindings in 1919.

Tin.—War conditions reacted favourably upon the tin trade. In July 1918 the price reached \$160 per picul, and subsequently \$185 when buying was prohibited except under licence. But after the Armistice the price, already declining, was further lowered when the Imperial Government ceased to buy direct, and the Federated Malay States had to guarantee purchase at \$118 per picul.

Commerce.—Imports were valued at £43,856,000 sterling in 1914, and exports at £38,032,000. Both rose annually thereafter almost without exception, until in 1919 the figures were imports, £96,664,000, exports, £99,318,000. The *entrepôt* trade in tin and Para rubber is illustrated by the following figures for 1919—

Imports (piculs)				
From	Tin	Tin Ore	Rubber	
Malay States	131,000	686,000	1,412,000	
Netherlands India	38,000	113,000	456,000	
Siam	6,000	207,000	—	
Other countries	2,000	32,000	79,000	

Exports				
To	Tin, piculs	Value	Rubber, piculs	Value
United Kingdom	324,000	\$41,347,000	406,000	\$44,088,000
United States	454,000	\$59,928,000	2,310,000	\$230,511,000
Elsewhere	210,000	\$27,445,000	254,000	\$24,227,000

Shipping.—The total tonnage of shipping entered and cleared for the year 1919 is shown as follows. Singapore 14,088,775; Penang, 4,009,126; Malacca, 564,400. (Christmas I. and Labuan, 222,882. The principal flags were British (nearly five-ninths of the whole), Japanese, and Dutch, and the total increase over the year 1918 was 5,820,913, nearly four-fifths of which was in British shipping. The total of 18,885,183 tons thus compares with 13,064,270 tons for 1918 when the shortage of shipping was most acute, and with 27,124,789 tons in 1913.

Work on the Lagoon wet dock and main wharf reconstruction, Tanjong Pagar, was completed and made over to the Singapore Harbour Board in May 1917. The revenue and expenditure of the Board, which reached \$6,015,648 and \$4,216,015 respectively in 1912, declined to \$5,432,425 and \$3,421,271 in 1915, and amounted to \$9,617,718 and \$5,444,410 in 1918. Penang wharf and dock receipts amounted in 1919 to \$96,372 (approximately), and expenditure to \$815,092. The wharf tonnage returns for Singapore and Penang show the following figures—

	No of Vessels	Net Tonnage	Inbound and Outbound	
			(coal, tons)	(cargo, tons)
Singapore	1913	2,708	5,794,536	1,338,495
	1918	2,114	3,330,791	732,231
Penang	1913	732	1,532,361	282,067
	1918	513	581,132	60,029

Land Communications.—The Singapore Railway Transfer Ordinance, 1918, enabled the Government of the Federated Malay States to construct a causeway across Johor Straits and to lay a railway to connect the Singapore line with the Johor and Federated Malay States systems. The sale of the Singapore Railway and railway stores involved a sum of \$4,149,750. Metalled roads in the colony at the end of 1919 had a length of 584 m. (Singapore, 96 m.;

Penang and the Dindings, 86 m.; Province Wellesley, 166 m.; Malacca, 231 m.; Labuan, 5 m.), and the Public Works Department had charge, in addition, of 50 m. of gravelled roads in Malacca, and 93 m. of "natural" roads in Penang, the Dindings, and Prov. Wellesley.

Education.—The centenary of the modern foundation of Singapore by Sir Stamford Raffles was the occasion of local celebrations in Feb. 1919, and by way of commemoration it was decided to found a Raffles College for higher education. Evidence of the general enthusiasm for this scheme was given by the prompt provision of subscriptions which ensured its success and enabled plans to be laid forthwith. The Straits Settlements Government promised a donation of \$1,000,000 and an annual contribution of \$50,000. the Governments of the Federated Malay States and Johor, and many private individuals, contributed. There have been other signs of a demand for a more active education policy; it being especially desirable as a counter measure against undesirable propaganda.

The Government maintained in 1919 eight English schools, and aided 45 English, Anglo-Tamil, Malay, Tamil, and Chinese schools; it also supported the Malacca Training College for Malay teachers. The Central Training College in Perak, the erection of which was started in that year, is intended for Malay teachers not only in the Federated Malay States but also in the Straits Settlements.

Labuan.—Revenue collected in Labuan in 1919 amounted to \$18,308, and expenditure was \$81,927. The total value of trade was \$3,748,930 in that year, and \$2,763,561 in 1918. Merchant shipping entered and cleared amounted to 141,686 tons in 1919. The Labuan Exploration Co. of London undertook a geological survey in 1920 with the view of prospecting for minerals.

Christmas Island.—Revenue (1919), \$26,135; expenditure, \$12,791. The export of phosphate of lime, which reached 89,889 tons in 1917, showing a large increase, fell to 53,370 tons in 1918 and amounted to 68,621 tons in 1919. The export was taken in 1919 by Japan (71%) and Australia. Shipping entered and cleared amounted to 81,197 tons (61% Japanese). There is a small export of rubber. The phosphate company maintained its output during the war, completed an inclined haulage way, and carried the railway to new quarries at South Point in 1918-9.

Cocos Islands.—A typhoon in 1909 left standing only 3% out of over 1,000,000 coco-nut palms, but replanting was completed in 1911, and export of copra was resumed two years later and reached 800 tons in 1918. An exchange cable station of the Eastern Extension Telegraph Co. and a high-power wireless station are established on Direction Island. The German raider "Emden" landed a party to destroy these on Nov. 9 1914, and was caught and herself destroyed by the "Sydney" of the Australian navy, running ashore on North Keeling Island, while her landing-party captured and escaped in the schooner belonging to the proprietor of the islands.

The governor of the Straits Settlements is high commissioner for the Malay States, Federated and Non-Federated (see MALAY STATES), and also for Brunei, and British agent for Sarawak and British North Borneo. These three divisions of northern Borneo are dealt with below.

Brunei (see 4 681)—Pop. (1911), 21,718. Revenue (1919), \$162,020; expenditure, \$138,844. Imports were valued in 1916 at \$254,756, and \$614,061 in 1919; exports at \$734,254 in 1916 and \$1,134,864 in 1919, including plantation rubber (\$243,596), cutch (\$304,249), and coal (\$296,621). The demand for sago, wild rubber (jelutong) and other forest produce, and dried fish, was great, and purchase prices ceased to be controlled by a group of traders as previously, which enabled the peasantry to profit to the extent of balancing the high prices of rice and other foodstuffs. Attempts were made to increase home production. The rice crop of 1918-9 failed, but the effort was maintained and rewarded in the following season. Plantation rubber (429,823 lb.) came mainly from the Brunei district, which has become the chief centre of the industry, in place of the Temburong basin. The cutch industry was suffering from the former indiscriminate cutting of mangroves in accessible districts where no replanting had been done, and the production was only maintained at the expense of heavier labour and transport. The Brookeon collieries yielded 29,565 tons of coal in 1918 and 26,274 tons in 1919. Attempts to develop a petroleum field at Tutong at this period were unsuccessful, though it was still expected that later there would be good results. Plantations and mines were encountering a serious shortage of labour, owing to the prosperity of the native traffic in forest produce, etc., above referred to.

Sarawak (see 24 207)—Pop. (estimated 1919), 600,000. Revenue (1918), \$1,921,964, expenditure, \$1,455,692. Imports, \$9,908,732, exports, \$11,540,190. Gold was exported to the value of \$1,256,500 in 1915 and \$923,100 in 1918. An extensive oil-field has been developed in Baram district, and 74,400 tons of oil were exported in 1918. Other principal exports include sago, pepper, and jelutong. There are four wireless stations, affording communication with Singapore. Charles Vyner Brooke (b. 1874) succeeded his father, Sir Charles Johnson Brooke, as rajah on May 17 1917.

British North Borneo (see 4 262)—Pop. (1911), 208,183; (estimated 1919), 227,000. The revenue of the British North Borneo Chartered Company (exclusive of land sales) has shown unbroken increase since 1910, from £170,767 in that year to £234,804 in 1914

and £373,936 in 1919; expenditure for 1919 amounted to £193,230. Imports were valued in 1919 at £925,235, and exports at £1,453,990, including rubber (£782,037), tobacco (mostly grown on estates; £230,122), coal (£78,706), copra (£39,629), cutch (£24,651), sago, and dried fish. The company's railway from Jesselton extends to Melalap in the interior, and has a branch from Beaufort to Weston, and a total length of 130 miles. There are four wireless stations. A Legislative Council was established in 1911 to aid the governor and civil staff in the local administration the commercial, planting, Chinese, and native communities are represented on it. The company created an opium monopoly department in 1913, following the policy of the Straits Settlements Government. (O. J. R. H.)

STRANG, WILLIAM (1859-1921), British painter-etcher (see 25.082), was in 1918 elected president of the International Society of Sculptors, Painters and Gravers. In 1909 the degree of LL.D. was conferred upon him by Glasgow University. His later work includes the etchings "The Little Flower Girl" (1909); "Nymph and Shepherds" (1910); "On the Omnibus" (1911); "The Walls of the Alhambra" (1912) and "The Mirror" (1912); besides various portraits, including one of Thomas Hardy (1910). He had only recently been elected a full R.A. when he died suddenly at Bournemouth, on April 12 1921.

See *Catalogue of William Strang's Etched Work, 1882-1912* (1912).

STRATEGY: see TACTICS.

STRATHCONA AND MOUNT ROYAL, DONALD ALEXANDER SMITH, 1ST BARON (1820-1914), Canadian statesman (see 25.1000), died in London Jan. 21 1914. His barony passed by special remainder to his daughter Margaret Charlotte, wife of Robert Jared Bliss Howard, of Montreal (d. 1921).

STRAUSS, RICHARD (1864-), German composer (see 25.1003). His opera, *Ariadne auf Naxos* (1912), was produced at His Majesty's theatre by Thomas Beecham in May 1913 and the same year *Der Rosenkavalier*, first produced at Dresden in 1910, was performed at Covent Garden with great success, eight performances being given, in point of fact, this proved to be Strauss's most popular opera. His other recent works include *Festliches Proeludium*, for orchestra (1913), and *Josephs Legende* (1914). In addition to the works enumerated mention should be made of *Eine Alpensinfonie*, (1915, op. 64); and the three-act opera, *Die Frau ohne Schatten*, libretto by Hugo von Hofmannsthal (1916, op. 65). In the winter of 1920-1 Strauss visited S. America, where he officiated at Buenos Aires as opera conductor, subsequently returning to Vienna.

STRAVINSKY, IGOR (1882-), Russian musical composer, was born at Oranienbaum, near St. Petersburg, June 18 (O.S. June 5) 1882. His father was an opera singer, who early discovered his son's remarkable musical gifts. At the same time, however, he wished the boy not to devote himself entirely to music but to study law, and with this end in view Igor Stravinsky entered the University of St. Petersburg. At the age of 22, however, a meeting with Rimsky-Korsakov decided him in the direction of a musical career, and the former declared himself ready to take Stravinsky as a pupil. His first work for orchestra was a symphony (1907), followed by a suite, *Faune et Bergère*, and two short works, also for orchestra, *Feu d'artifice* and *Scherzo fantastique*. A meeting with Serge Diaghilev turned his attention to the possibilities of the ballet, and in rapid succession appeared *L'Oiseau de feu* (1910), *Petrouchka* (1911), and *Le Sacre du Printemps* (1913). His next important work was an opera, *Le Rossignol* (1914), founded on Hans Andersen's fairy story of *The Nightingale*, of which the second and third acts were later worked up into a symphonic poem, *Le Chant du Rossignol* (1917). The opera was produced at Covent Garden in 1920, and the same year appeared a revision by Stravinsky of Pergolesi's *Pulcinella*.

STRAUVELS, STIJN, the pen-name of FRANK LATEUR (1871-), Flemish author, who was born at Heule, West Flanders, Oct. 4 1871. He was a nephew of Guido Gezelle (1830-1899), a celebrated Flemish poet, and until 1905 worked as a baker at Avelghem, a village near Courtrai in West Flanders. Writing in the West Flemish dialect, he was accepted in Belgium and Holland as the most distinguished Low Dutch author of his day. He produced many short stories, including *Openlucht* (1905) and *De Vlaschaard* (1908), a collection of which, trans-

lated into English by A. Teixeira de Mattos, appeared in 1915 under the title of *The Path of Life*. In 1912 appeared *Ha glorierijke Licht* ("The Glorious Light").

STRIKES AND LOCK-OUTS (see 25.1024).—In the following account of later developments between 1907 and 1921, strikes in the United Kingdom are first dealt with, sections following for other countries.

(A) UNITED KINGDOM

I. *Statistics*.—Table 1 shows the total number of strikes or lock-outs recorded in each year from 1907 to 1920, inclusive; the number of workpeople involved therein, and the aggregate loss of working days due to these disputes.

Table 1.

	No. of Disputes	No. of Workpeople Directly and Indirectly Involved	Aggregate Duration of Disputes in Working Days
1907	601	147,000	2,162,000
1908	399	296,000	10,834,000
1909	436	301,000	2,774,000
1910	531	515,000	9,895,000
1911	903	962,000	10,320,000
1912	857	1,463,000	40,915,000
1913	1,497	689,000	11,631,000
1914	999	449,000	10,111,000
1915	707	453,000	3,040,000
1916	578	281,000	2,581,000
1917	803	885,000	5,809,000
1918	1,300	1,142,000	6,332,000
1919	1,413	2,515,000	34,903,000
1920	1,715	1,932,000	27,011,000

It will be seen that the figures show a general advancing tendency, partially checked during the World War. The total for the year 1920 shows the highest figure ever recorded for number of disputes, the highest figure (with one exception) for the number of workpeople involved, and the highest figure (with three exceptions) for the aggregate duration of disputes. The exceptions in this latter case are 1893, with 30,468,000 working days; 1912, with 40,015,000 working days, and 1919, with 34,903,000 working days. In 1893, 1912 and 1920 the high figures were principally due to great coal strikes; the year 1919 was a year of great industrial unrest.

As showing the general advancing tendency of the figures, it may be instructive to compare the average of the four years 1907-10 with the average of the four years 1917-20:—

	Average of Years 1907-10	Average of Years 1917-20
No. of Disputes	492	1,308
No. of Workpeople Involved	315,000	1,633,500
Aggregate Duration (in Working Days)	6,416,000	18,511,000

It should be stated that the increase in the number of disputes may be partly accounted for by improved facilities for obtaining information with regard to minor disputes, which may have previously escaped notice; but this will not account for more than an insignificant part of the increase in the figures for number of workpeople involved and for aggregate duration, since the greater disputes, involving large numbers of workpeople, have always been well reported in the newspapers. Table 2 (p. 583) shows the distribution of strikes between the principal groups of trades, taking the averages for the 10 years 1911-20.

Table 2 shows that the average number of workpeople involved in each dispute was a little over 1,000, and that the average duration of disputes was about 14 days. The figures, however, vary widely as between one trade and another. Thus, the average number of workpeople varies from a little more than 200, in the building trades, to over 3,000 in the mining and quarrying group; while the average duration varies from 8 days, in the transport trades, to 27 days in the building trades.

The figure for average numbers involved, and still more that for the average duration, give an exaggerated idea of what may be called the "normal" magnitude and duration of a strike. It is the great strikes, involving many thousands of workpeople, that are commonly also the hardest fought and the most prolonged. Great

masses of workers are not mobilized for industrial conflict except for some object which they regard as of first-class importance, and it is exceptional for a strike or lock-out of this magnitude to occur unless all means of reaching a pacific settlement have been exhausted, and unless both employers and workpeople are organized in strong combinations, with great financial resources. All these factors tend to prolong precisely those strikes—in reality a small minority—which involve large numbers of workpeople, and thus exaggerate enormously the figure for "aggregate duration." For example, nearly 40% of the aggregate duration of disputes in the building trades was due to the great dispute in the London building trade in 1914, which lasted for more than six months and accounted for about 2,500,000 working days. In the mining and quarrying industry, two-thirds of the total aggregate duration of all the disputes was due to the two great coal strikes of 1912 and of 1920; if these were eliminated, the average number involved in disputes in this group of trades would be reduced from over 3,000 to 1,800, and the average duration from 14 to 8 days. The case is much the same with the other great groups of trades; and, speaking broadly, it may be said that the vast majority of recorded disputes involve comparatively small numbers of workpeople, and last less than a fortnight—often indeed, only a few days.

To put the same thing in another way. The number of disputes which had an aggregate duration of 25,000 days and upwards varied, in the period 1904-13, from 11 (in 1904) to 72 (in 1913), with an average of 32, or 5% of the total number of disputes. Yet this 5% of disputes accounted for 65% of the number of workpeople involved, and for no less than 86% of the aggregate duration. Or again, the number of disputes in which 2,500 workpeople or upwards were involved varied, in the years 1904-13, from a minimum of 4 (in 1905 and in 1907) to a maximum of 43 (in 1913), with an average of 18, or less than 3% of the total number of disputes, but this 3% of disputes accounted for 67% of the total number of workpeople involved, and for 74% of the aggregate duration.

Some trades are far more subject to industrial disturbance than others; in the building trades the proportion of men who strike or are locked out rarely reaches 1% of the total number employed in the industry, and in the clothing trades the proportion is not much higher; whereas in the coal-mining industry the proportion who strike or are locked out rarely falls below 5% and frequently rises above 20% in a year.

The mean percentages of workpeople involved in disputes for the years 1904-13 were as follows.—

Building trades	0.7
Coal mining	21.4
Other mining and quarrying	2.2
Metal engineering and shipbuilding	3.3
Textile trades	6.4
Clothing trades	1.3
Other trades	1.7
All Trades	4.4

The statistics of *causes* show, on the whole, remarkable regularity. Such fluctuations, as there are, are due principally to the prevalence or otherwise of wage disputes. In years of good or improving trade, strikes for advances in wages are numerous, in years of bad and declining trade such strikes become much fewer.

The statistics of *results* show somewhat less regularity. The principal features of this part of the table are the diminishing proportion of disputes settled in favour of the employers, and the

Table 2

Group of Trades	No. of Disputes	No. of Workpeople involved (Thousands)	Aggregate Duration in Working Days (Thousands of Working Days)
Building	119	25	652
Mining and Quarrying	164	508	7,067
Metal Engineering and Shipbuilding	265	180	2,765
Textile	107	138	2,143
Clothing	58	19	258
Transport	88	150	1,230
Miscellaneous (including Employees of Public Authorities)	260	68	968
Average for all above Trades ¹	1,061	1,088	15,083

¹ Exclusive of the general strike at Dublin in 1913-4, which cannot be classified under any of the separate trade headings. This strike involved about 20,000 workpeople, and had an aggregate duration of about 1,900,000 working days.

increasing proportion settled by a compromise. In the first half of the period the proportion of disputes settled in favour of the workpeople was 24% on the average, settled in favour of the employers, 44%; and compromised, or partially successful, 32%. In the second half of the period the corresponding percentages were 26, 28, and 46. It should be noted that the second period includes three or four years of exceptional prosperity, a condition which tends to promote settlements in favour of the workpeople, and that this was followed by the period of the war, when prices were constantly rising and industrial conditions were altogether abnormal.

Table 3 classifies the disputes of the years 1900 to 1920, (a) according to their causes, and (b) according to their results.—

Table 3

Year in which Disputes began	Proportion of Disputes arising on questions of					Proportion of Disputes settled				
	Wages	Hours of Labour	Employment of particular Classes or Persons	Other Questions	Total	In favour of Workpeople	In favour of Employers	Compromised	Indefinite or Unsettled	Total
	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
1900	68	1	14	17	100	31	34	34	1	100
1901	63	4	13	20	100	26	44	30		100
1902	60	5	13	22	100	24	47	28	1	100

II. *Principal Disputes*—The year 1908 (in contrast to 1907, which was entirely free from any disputes on a great scale) saw three great disputes: (1) a shipbuilding dispute involving 35,000 workpeople, and with an aggregate duration of 1,719,000 working days, (2) an engineering dispute on the N.E. coast, involving 11,000 workpeople, and with an aggregate duration of 1,706,000 working days; and (3) a dispute in the cotton trade, involving 120,000 workpeople, and with an aggregate duration of 4,830,000 working days.

In each of these three disputes the workpeople struck against (or were locked out to enforce) a proposal to reduce wages. This was at one time a common and important cause of disputes, the great coal strike of 1893, for example, was against a reduction in wages. During 1910-20 there were few or no disputes of any importance on this ground; in fact, these three disputes in 1908 were the last important disputes arising out of an attempt to reduce wages, until the ship-joiners' dispute, which, beginning in Dec. 1920, was the precursor of a series of strikes or lock-outs culminating in the coal strike of 1921.

In each of the three disputes referred to above, one or more of the trade unions concerned was prepared, before the strike or lock-out occurred, to accept the terms offered by the employers; but in each case one or more other trade unions resisted the reduction. Modified terms offered by the employers were accepted in all three cases.

There were no important disputes in 1909; but in 1910 several prolonged disputes, involving large numbers took place.

Trouble arose in Northumberland and Durham in Jan. 1910, with regard to the working of the coal mines under the Eight Hours Act (the Coal Mines Regulation Act, 1908), which came into operation, in those two counties, on Jan. 1 1910. Agreements had been reached between the two coal owners' associations and the respective miners' union in Dec. 1909, as to the working of the mines under the new arrangements, but a large number of men at the various mines repudiated the agreements, and refused to go down the pits. About 85,000 workpeople were involved in Durham, and about 30,000 in Northumberland. At most of the pits the strike was over by the end of Jan.; but a minority of men stood out, and the strike was not finally settled until April. The aggregate duration of the dispute was about 1,280,000 working days in Durham and about 1,080,000 working days in Northumberland.

Certain members of the United Society of Boilermakers and Iron and Steel Shipbuilders stopped work in Aug. 1910, in breach of an agreement with the Shipbuilding Employers' Federation, at two shipyards, one on the Tyne and the other on the Clyde; and the Employers' Federation locked out the members of the Boilermakers' Society at all the federated shipyards on Sept. 3. About 25,000 workpeople were directly or indirectly affected.

A provisional agreement made between representatives of the parties on Oct. 11 1910, was twice rejected by the workpeople on a ballot vote, and it was not until Dec. that a final agreement supplementing that of March 1909 was reached, and accepted by the workers. Work was resumed on Dec. 15. The aggregate loss of time in this dispute was about 2,850,000 working days.

A strike of *coal miners and surface workers* in the Rhondda Valley began on Sept. 1 1910 and continued for nearly a year, being settled in Aug. 1911. It arose out of a dispute at one pit concerning the price list for a particular seam, and was followed by sympathetic strikes at other pits belonging to the same employers. An agreement was finally reached on the price list, and on a guarantee of an average wage. About 12,800 men and boys were involved at the beginning of the strike.

The years 1911-2-3 were years of violent, and almost continuous industrial unrest. Among the most important disputes of these years were those described below.

A series of *seamen's and transport workers'* strikes began in June 1911. The original occasion of the first dispute was a demand put forward by the National Sailors' and Firemen's Union for the formation of a conciliation board, consisting of representatives of the Union and of the Shipping Federation, to consider a programme of reforms desired by the Union. The Federation refused to discuss the demands, and the seamen and firemen came out on strike at various dates in June 1911, many of the principal ports being affected. (London was not affected till a little later.) Strikes of dock labourers, carters, tramwaymen, and other transport workers occurred at some of these ports, partly in sympathy with the seamen, and partly in support of demands of their own for improved working conditions. Serious disorder occurred at Hull, Manchester and Salford.

Settlements were reached at various dates in July and Aug. affecting seamen and dockers at Hull and Goole; seamen and carters at Manchester, dock labourers and tramwaymen at Liverpool; and seamen and transport and other workers at Cardiff. There were also a large number of sectional settlements in the London dock, shipping, and transport trades.

The *railway* dispute of 1911 began with a strike of 1,000 railwaymen (goods porters, etc.) at Liverpool on Aug. 5, the men alleging their inability to get their grievances dealt with by the conciliation boards set up under the scheme of 1907. They were joined by railwaymen at Manchester and at many other centres. On Aug. 15 the executives of four of the railwaymen's trade unions sent to the various railway companies a resolution, stating that they were being pressed by their members to declare a strike, and giving the companies 24 hours to decide whether they would immediately meet representatives of the workers to discuss their grievances. The Government

got into touch with representatives of the companies and of the trade unions on Aug. 16, and on the following day the Prime Minister announced that the Government was prepared to appoint immediately a Royal Commission, to investigate the working of the Railway Conciliation Agreement, and to report what amendments, if any, were desirable in the scheme. This announcement did not prevent a strike, but a provisional settlement was reached on Aug. 19, and work was generally resumed on Aug. 21 (except on one railway, where it was resumed on Aug. 23). The Royal Commission began its sittings on Aug. 23, and reported on Oct. 18. The trade unions, however, refused to accept the Commission's recommendations without various modifications; the railway companies, on their side, took the line that both sides were bound by the findings of the Commission. On Nov. 22 the House of Commons debated the question, and passed a resolution to the effect that the parties should be invited to meet with the view of discussing the best mode of giving effect to the report of the Royal Commission. The Board of Trade signified to the parties their readiness to call a fresh conference "on the understanding that the findings of the Royal Commission were accepted in principle and in substance." The parties accepted these conditions, and a conference was held, at which an agreement was reached, the recommendations of the Royal Commission being accepted with certain alterations and additions. The effect of the new agreement was to expedite the settlement by the conciliation boards of matters in dispute, to secure greater uniformity in the decisions of the conciliation boards, and to give such decisions greater finality than they had previously possessed.

The Cotton Weavers' Association of N. and N.E. Lancashire engaged in an active campaign in this year (1911) against the employment of non-unionists. The employers replied by a general lock-out, which began on Dec. 28, about 160,000 workpeople being involved. This is exclusive of the workpeople in the spinning section of the trade, who were put on short time, or thrown out of work, owing to the stoppage of the principal outlet for their production. The chief industrial commissioner (Sir George Askwith) invited the parties to a conference, which was duly held, and an agreement was reached on Jan. 19 1912. Work was to be resumed on Jan. 22, under the old conditions of employment, on the understanding that no action should be taken for six months in the way of tendering notices or striking mills on the non-unionist question. It was also agreed that, at the end of that period, Sir George Askwith would, if requested, submit proposals for the settlement of the question.

The great *coal* strike of 1912 involved an aggregate loss of working time of over 30,000,000 working days in the coal mines alone. There was also, of course, much consequential unemployment and under-employment in other industries. The percentage unemployed among members of trade unions rose to 11.3% at the end of March 1912; while blast furnaces, steel sheet works, and the glass bottle industry, were brought almost to a standstill, and tinplate mills working were reduced to about 14% of the normal number.

The strike arose out of a demand by the Miners' Federation for the payment of a minimum wage for every man and boy working underground in the mines. A conference between representatives of the coal-owners and of the miners had discussed the question of the earnings of miners in "abnormal" places (i.e. in working places where, owing to the thinness of the seams, or other causes beyond their control, the hewers were unable to earn the recognized minimum or average rate for the district), and a considerable measure of agreement had been reached; but at the annual conference of the Miners' Federation at Southport on Oct. 6 1911, it was decided "to take immediate steps to secure an individual district minimum wage for all men and boys working in mines in the area of the Federation, without any reference to the working places being abnormal."

A ballot of the members of the Federation was taken on the question of handing in notices to establish the principle of an individual minimum wage, as expressed in the resolution quoted above. There was a large majority (445,801 to 115,721) in favour

of giving notice; and notices were accordingly handed in, to terminate at the end of Feb.

At a subsequent meeting the Miners' Federation fixed the minimum rates they were prepared to accept in each district for piece workers "at the face" (i.e. hewers, etc.), and also added the following general instructions to their representatives, for their guidance in any negotiations that might ensue with the mine owners:—

"No underground adult worker should receive a rate of wages less than 5s. per shift." (This did not apply to the Forest of Dean, or to Bristol and Somerset.) "Individual minimum wages for all piece workers other than colliers to be arranged by the districts themselves, and to be as near as possible present wages."

Day rates for underground workers, and boys' wages, were also to be left to local arrangement; the boys' wages not to be less than the then existing wages, and not in any case less than 2s. a day.

Unsuccessful negotiations took place between the coal owners and the men; and on Feb. 20 Mr Asquith, who was at that time Prime Minister, intervened, and invited both parties to meet him and other members of the Government, separately, in conference on Feb. 22. From that date onward till March 15 the Prime Minister kept in constant touch with the parties, who finally met, in joint session, with representatives of the Government, on March 12, 13 and 14. On March 15, the Prime Minister announced that the Government had decided to ask from Parliament "a legislative declaration that a reasonable minimum wage, accompanied by adequate safeguards for the protection of the employer, should be a statutory term of the contract of employment of people who are engaged underground in coal mining."

In accordance with this announcement the Prime Minister introduced a bill in the House of Commons on March 19 1912, which received the Royal Assent on March 29, as the "Coal Mines (Minimum Wage) Act, 1912." The Act provided for the setting up of a joint district board in each of 22 districts specified in a schedule to the Act, to determine the minimum rates of wages for workmen employed underground in coal mines. On March 27 the coal owners met and adopted a resolution in favour of working the Act, and on the same day the men's Federation decided to take a ballot of the members on the question of resuming work, pending the settlement of minimum rates by the district boards. The ballot showed a majority (244,011 to 201,013) against resumption; but, at a national conference held on April 6, it was decided to terminate the strike.

A great strike of dock and other transport workers in the Port of London and on the Medway began on May 21 1912, and lasted over two months. The immediate occasion of the dispute was the refusal of a workman who belonged to the Amalgamated Society of Foremen Lightermen to join the Amalgamated Society of Watermen, Lightermen, and Bargemen; the latter society is affiliated to the National Transport Workers' Federation, but the former is not. The employers refused to interfere, and between 5,000 and 6,000 lightermen left work on May 21, followed later by a number of dock workers, who ceased work in sympathy.

The underlying cause of the dispute, however, was dissatisfaction with the carrying out of the various agreements that had been arrived at in settlement of the disputes in the previous year (see above). The Government ordered an enquiry to be held by Sir Edward Clarke, K.C.; and the alleged grievances of the workmen were found to come under seven heads, including:—

Employment of non-union men, in alleged breach of an agreement, by two of the employers' associations.

Refusal of an employers' association to meet the trade union to discuss rates of wages and conditions of labour.

Refusal of certain employers to pay rates of wages fixed by various awards or agreements. Alleged interference with union workmen.

The board of trade invited representatives of the employers and of the workers to a conference, to discuss Sir E. Clarke's report. The men accepted, but the employers declined to be present, and stated that they could not accept Sir E. Clarke's report as an award on the points dealt with by him. They were unable to adopt certain suggestions made by the Board of Trade for the formation of a federation of employers; and refused, "under any circumstances, to any recognition of the Union of

Transport Workers' Federation ticket, or any discussion for such recognition." Following upon debates in the House of Commons, and upon further conferences with the parties, the Government put forward various proposals on June 7; these were accepted (in substance) by the men, but refused by the employers. The Transport Workers' Federation thereupon declared a national strike of transport workers. Certain of the unions affiliated to the Federation took a ballot of their members as to the advisability of ceasing work, the result being in each case a majority against a strike; and only about 20,000 men, at Manchester and some of the minor ports, came out on strike. These all returned unconditionally after a few days' stoppage.

The places of the men on strike in London had by this time begun to be filled up by non-unionists; and the employers took a very determined attitude, refusing to agree to any conditions precedent to the men returning to work. Further negotiations were fruitless, and on July 27 the men's strike committee recommended an immediate resumption of work. By July 31 the return to work was fairly general, and by Monday, Aug. 6, practically all the men who could find work were reinstated. About 100,000 workpeople were involved in the dispute, and the aggregate duration was about 2,700,000 working days.

A strike of tube and other metal workers in Birmingham, Wolverhampton, Wednesbury, and other towns in the "Black Country," began on April 25 1913, and continued until the middle of July. As many as 50,000 workpeople were involved at the height of the dispute, and the aggregate duration was about 1,400,000 working days. The majority of the strikers were labourers or semi-skilled workers; but a large number of skilled men were thrown idle owing to the absence of the labourers. The men demanded an all-round advance of 2s. a week on day-rates, and 20% on piece-rates, with a standard minimum of 23s. a week for unskilled men, and various rates, on a scale rising with each year of age, for youths and for girls. The parties were brought together through the intervention of the chief industrial commissioner, and an agreement was signed on July 7, fixing the standard rate for adult able-bodied unskilled labourers at 23s. in the Birmingham district, and at 22s. in the Black Country district, to be raised to 23s. after six months. The rates for youths and for girls were also fixed, on a scale rising by ages. Piece-work rates were to be fixed by agreement between the several employers and their workmen, the day-rate, however, being guaranteed irrespective of piece-work earnings.

The Dublin dispute of 1913-4 was unique in British industrial history, in that it was the only dispute of importance, at least since regular records have been compiled, in which all the trades of a whole city and district were involved, including even agriculture. It was, in fact, the nearest approach to a "general" strike that had ever been known. Ever since the year 1908 there had been much industrial unrest in Dublin, frequently taking the form of the sympathetic strike. The "sympathetic" strike, in this developed and organized form, is a species of boycott, aiming at the complete dislocation of the trade of the firm or firms attacked, the withdrawal of their own employees is supplemented and reinforced by the refusal of the employees of other firms to handle their goods. The immediate occasion of the strike was an announcement by the Dublin Tramway Co. of the temporary closing of their parcels department, and of their intention, when that department was reopened, not to allow their employees in that department to belong to the Irish Transport and General Workers' Union, which had been active in the policy of the sympathetic strike. A number of tramwaymen struck work on Aug. 26, demanding the reinstatement of the locked-out workpeople in the parcels department, they also put in claims for increased wages, shorter hours, and other concessions. Following this came strikes (or lock-outs) of employees of flour millers, coach builders, biscuit manufacturers, coal merchants, steamship companies, master carriers, master builders, timber importers, cement and brick merchants, and farmers in the County Dublin, besides a large number of independent firms, in a wide variety of trades. At a meeting on Sept. 3, 400 employers in Dublin passed a resolution to the effect that "the

Trouble arose in Northumberland and Durham in Jan. 1910, with regard to the working of the coal mines under the Eight Hours Act (the Coal Mines Regulation Act, 1908), which came into operation, in those two counties, on Jan. 1 1910. Agreements had been reached between the two coal owners' associations and the respective miners' union in Dec. 1909, as to the working of the mines under the new arrangements, but a large number of men at the various mines repudiated the agreements, and refused to go down the pits. About 85,000 workpeople were involved in Durham, and about 30,000 in Northumberland. At most of the pits the strike was over by the end of Jan.; but a minority of men stood out, and the strike was not finally settled until April. The aggregate duration of the dispute was about 1,280,000 working days in Durham and about 1,080,000 working days in Northumberland.

Certain members of the United Society of Boilermakers and Iron and Steel Shipbuilders stopped work in Aug. 1910, in breach of an agreement with the Shipbuilding Employers' Federation, at two shipyards, one on the Tyne and the other on the Clyde; and the Employers' Federation locked out the members of the Boilermakers' Society at all the federated shipyards on Sept. 3. About 25,000 workpeople were directly or indirectly affected.

A provisional agreement made between representatives of the parties on Oct. 11 1910, was twice rejected by the workpeople on a ballot vote, and it was not until Dec. that a final agreement supplementing that of March 1909 was reached, and accepted by the workers. Work was resumed on Dec. 15. The aggregate loss of time in this dispute was about 2,850,000 working days.

A strike of *coal miners and surface workers* in the Rhondda Valley began on Sept. 1 1910 and continued for nearly a year, being settled in Aug. 1911. It arose out of a dispute at one pit concerning the price list for a particular seam, and was followed by sympathetic strikes at other pits belonging to the same employers. An agreement was finally reached on the price list, and on a guarantee of an average wage. About 12,800 men and boys were involved at the beginning of the strike.

The years 1911-2-3 were years of violent, and almost continuous industrial unrest. Among the most important disputes of these years were those described below.

A series of *seamen's and transport workers'* strikes began in June 1911. The original occasion of the first dispute was a demand put forward by the National Sailors' and Firemen's Union for the formation of a conciliation board, consisting of representatives of the Union and of the Shipping Federation, to consider a programme of reforms desired by the Union. The Federation refused to discuss the demands, and the seamen and firemen came out on strike at various dates in June 1911, many of the principal ports being affected. (London was not affected till a little later.) Strikes of dock labourers, carters, tramwaymen, and other transport workers occurred at some of these ports, partly in sympathy with the seamen, and partly in support of demands of their own for improved working conditions. Serious disorder occurred at Hull, Manchester and Salford.

Settlements were reached at various dates in July and Aug. affecting seamen and dockers at Hull and Goole; seamen and carters at Manchester, dock labourers and tramwaymen at Liverpool; and seamen and transport and other workers at Cardiff. There were also a large number of sectional settlements in the London dock, shipping, and transport trades.

The *railway* dispute of 1911 began with a strike of 1,000 railwaymen (goods porters, etc.) at Liverpool on Aug. 5, the men alleging their inability to get their grievances dealt with by the conciliation boards set up under the scheme of 1907. They were joined by railwaymen at Manchester and at many other centres. On Aug. 15 the executives of four of the railwaymen's trade unions sent to the various railway companies a resolution, stating that they were being pressed by their members to declare a strike, and giving the companies 24 hours to decide whether they would immediately meet representatives of the workers to discuss their grievances. The Government

got into touch with representatives of the companies and of the trade unions on Aug. 16, and on the following day the Prime Minister announced that the Government was prepared to appoint immediately a Royal Commission, to investigate the working of the Railway Conciliation Agreement, and to report what amendments, if any, were desirable in the scheme. This announcement did not prevent a strike, but a provisional settlement was reached on Aug. 19, and work was generally resumed on Aug. 21 (except on one railway, where it was resumed on Aug. 23). The Royal Commission began its sittings on Aug. 23, and reported on Oct. 18. The trade unions, however, refused to accept the Commission's recommendations without various modifications; the railway companies, on their side, took the line that both sides were bound by the findings of the Commission. On Nov. 22 the House of Commons debated the question, and passed a resolution to the effect that the parties should be invited to meet with the view of discussing the best mode of giving effect to the report of the Royal Commission. The Board of Trade signified to the parties their readiness to call a fresh conference "on the understanding that the findings of the Royal Commission were accepted in principle and in substance." The parties accepted these conditions, and a conference was held, at which an agreement was reached, the recommendations of the Royal Commission being accepted with certain alterations and additions. The effect of the new agreement was to expedite the settlement by the conciliation boards of matters in dispute, to secure greater uniformity in the decisions of the conciliation boards, and to give such decisions greater finality than they had previously possessed.

The Cotton Weavers' Association of N. and N.E. Lancashire engaged in an active campaign in this year (1911) against the employment of non-unionists. The employers replied by a general lock-out, which began on Dec. 28, about 160,000 workpeople being involved. This is exclusive of the workpeople in the spinning section of the trade, who were put on short time, or thrown out of work, owing to the stoppage of the principal outlet for their production. The chief industrial commissioner (Sir George Askwith) invited the parties to a conference, which was duly held, and an agreement was reached on Jan. 19 1912. Work was to be resumed on Jan. 22, under the old conditions of employment, on the understanding that no action should be taken for six months in the way of tendering notices or striking mills on the non-unionist question. It was also agreed that, at the end of that period, Sir George Askwith would, if requested, submit proposals for the settlement of the question.

The great *coal* strike of 1912 involved an aggregate loss of working time of over 30,000,000 working days in the coal mines alone. There was also, of course, much consequential unemployment and under-employment in other industries. The percentage unemployed among members of trade unions rose to 11.3% at the end of March 1912; while blast furnaces, steel sheet works, and the glass bottle industry, were brought almost to a standstill, and tinplate mills working were reduced to about 14% of the normal number.

The strike arose out of a demand by the Miners' Federation for the payment of a minimum wage for every man and boy working underground in the mines. A conference between representatives of the coal-owners and of the miners had discussed the question of the earnings of miners in "abnormal" places (i.e. in working places where, owing to the thinness of the seams, or other causes beyond their control, the hewers were unable to earn the recognized minimum or average rate for the district), and a considerable measure of agreement had been reached; but at the annual conference of the Miners' Federation at Southport on Oct. 6 1911, it was decided "to take immediate steps to secure an individual district minimum wage for all men and boys working in mines in the area of the Federation, without any reference to the working places being abnormal."

A ballot of the members of the Federation was taken on the question of handing in notices to establish the principle of an individual minimum wage, as expressed in the resolution quoted above. There was a large majority (445,801 to 115,721) in favour

In Nov. 1916 the Government had introduced a system of "trade cards," under which certain trade unions, including the Amalgamated Society of Engineers, were permitted to issue cards to their own members, conferring (under specified conditions) protection from military service. The system was obviously open to abuse, and the Government decided to abolish it. Simultaneously they had before Parliament a new munitions bill, which, as originally drafted, proposed (*inter alia*) to make provision for "dilution" (*i.e.* the partial utilization of unskilled or semi-skilled labour on work hitherto confined exclusively to skilled men) on commercial engineering work. Previously "dilution" had been confined to Government work.

The immediate occasion of the strike was a trivial dispute at an engineering works at Rochdale, the owners of which had committed a technical offence against the Munitions Acts. They were prosecuted and fined; but the result of the prosecution was not known until after the strike had begun.

On April 29 1917 the honorary secretary of an unofficial body called "the Manchester Joint Engineering Shop Stewards' Committee" sent out a letter calling upon engineers to come out on strike at the close of work on the following day against (1) dilution on private and commercial engineering work, (2) the withdrawal of the trade cards, and (3) the new munitions bill. Most of the engineering employees in Lancashire (which is the chief centre of the textile engineering trade) came out; and also in Sheffield, Derby, Southampton, and finally London. On the other hand, Glasgow, Newcastle, Cardiff, Birmingham, and Leeds, which were mainly "munition" centres, and not likely to be affected by the new policy, remained at work.

The unofficial committee who had taken charge of the strike denounced the official executives of the trade unions in violent terms. The executives, on their side, denounced the strike, and came to an agreement with the Government for the abolition of the trade card system. The Government supported the executives, declared their determination not to recognize the rebellious shop stewards, and finally arrested eight of these. Ultimately, however, the Government was obliged to receive the shop stewards' leaders; but under the guise of "the unofficial strike committee," and accompanied by the Executive Council of the Amalgamated Society of Engineers (the principal trade union concerned). A settlement was immediately arrived at, the unofficial committee agreeing to go back to their districts and get the men back to work, and leaving the negotiations in the hands of the Executive Council of the Amalgamated Society of Engineers.

The trade card system was abolished; but later in the year the minister of Munitions announced the withdrawal of the clauses in the Munitions Bill which would have permitted dilution on private work.

The Coventry strike was also a "shop stewards" strike, Coventry being one of the centres of the Shop Stewards movement. Unrest in this town was increased by the housing conditions, which were very bad, owing to the influx of munition workers and the consequent excessive overcrowding. On Nov. 19, the toolmakers and toolsetters at one of the engineering works in Coventry adopted a "stay-in" strike, as a protest against their inadequate rates of pay (in comparison with the unskilled men whom they had to instruct), and also in support of their demand for the recognition of the shop stewards. Next day the shop stewards went in a body to interview the head of the firm; he was ready to meet them, "and not ask who they were," but this was not enough for them; they demanded to be received as shop stewards. The employer refused, and the shop stewards called out all the workpeople. The whole of the engineering firms at Coventry were stopped within a few days, when it was estimated that 50,000 workpeople (men and women) were out. The strike was settled on Dec. 2 1917, by four members of the Government, who interviewed representatives of the employers and of the workpeople, the latter including some shop stewards. The negotiations which followed led up to an agreement between the Engineering Employers' Federation and the trade unions which for the first time recognized shop stewards, if duly elected and officially endorsed and controlled by their trade unions.

Apart from the engineering and munition trades the most important dispute of 1917 was a strike of *colliery examiners* (overmen, firemen, and shot-firers) in South Wales for the recognition of their trade union; the other underground and surface workers, to the number of nearly 128,000, were thrown idle by the strike. After a stoppage of three days the Colliery Examiners' Trade Union was recognized, and the employers agreed to set up a joint board to decide questions relating to firemen and shot-firers.

Industrial disputes were very numerous in 1918, but the great majority involved small numbers and were of short duration. Nearly all the considerable disputes occurred in the second half of the year; the extreme seriousness of the military situation in the first half of the year exercised a restraining influence sufficient to prevent many large movements. The only strike of any magnitude in this period was one among coal miners in the employment of a "combine" in S. Wales, who sought for recognition of a committee of their own, confined to workers in the pits of the combine.

An engineering and munition strike occurred at Coventry and Birmingham in July 1918, against the introduction of what was known as the "embargo." This was a prohibition by the Government of the engagement of any additional skilled men by certain firms. The prohibition applied only to a very small number of firms, but this fact was not known to the workers; indeed the existence of the embargo at all was not generally known until a notice (in misleading terms) was issued by one of the firms affected. The strike was brought to an end, after a week's stoppage, by the Government announcing that men absent from work on July 29 would have their protection certificates withdrawn.

Two strikes in the cotton trade occurred in this year, one in Sept. and the other in December. The first arose from a demand of the cotton spinners and piecers for unemployment pay for time lost owing to the restrictions on the working of the mills imposed by the Cotton Control Board to meet the shortage of raw material. They returned to work after a week's stoppage on the promise of an enquiry by an independent tribunal, to be appointed by the Government. The second strike was in support of a demand by the cotton spinners and piecers, and the card-room workers, for an advance of 40% on the current rates of wages (*i.e.* on the list prices, plus all the percentage additions already made thereto). They returned after nine days' stoppage, having obtained an advance of 50% on the standard piece-price list of wages, equivalent to about 30% on the current rates.

In this year there was also a long dispute (lasting 47 working days) between a cooperative society and the Amalgamated Union of Cooperative Employees. This union seeks to organize all classes of employees of cooperative societies, whether distributive or productive, without regard to occupation, or "craft." The cooperative society, however, demanded that its employees in printing works should belong to one or other of the "craft" unions, and not to the Amalgamated Union of Cooperative Employees. The matter was ultimately referred to arbitration, and decided in favour of the society.

The years 1919 and 1920 were years of great industrial unrest in a variety of trades. The hours of labour in the engineering and shipbuilding trades were reduced, as from Jan. 1 1919, from 53 or 54 to 47 per week; but many of the workers were dissatisfied, some desiring a reduction to 44 or even 40 hours, while others were aggrieved because the rates paid to piece workers and to "lieu" workers were not increased to compensate for the reduction of hours. (Time workers received the same rate of pay for the reduced hours as for the hours previously worked.) Workpeople, to the number of 150,000 in all, came out on strike in Jan. at various centres, and remained out for periods ranging from one to eight weeks. Some returned to work unconditionally; others agreed to return on the promise of a national settlement.

There was much unrest in the coal mining industry. One hundred and fifty thousand miners were on strike in Yorkshire in Jan. 1919, in support of a demand for a simultaneous stoppage of 20 minutes per shift for meals for surface workers; most of these were out for one or two days only. The demand was granted, for the period of Government control. The same men were on strike

again in July and Aug., for an advance of 14.3% in piece-rates to compensate for the reduction in hours from eight to seven per day, after a stoppage of from 25 to 29 days they accepted the national settlement, which gave an advance of 12.2%. In March 100,000 miners in South Wales, the Midlands, and Yorkshire were on strike, and another 75,000 miners in Nottinghamshire, Derbyshire, Lancashire, and other districts were on strike in July, over the question of the miners' demands for increased wages, a reduction of hours, and the nationalization of the mines.

There was a great strike in the cotton trade, for a reduction of hours and 30% advance in wages, in June and July 1919, both the spinning and the weaving sections being affected. The advance was granted, and the hours were reduced from 55½ to 48 hours per week (instead of 46½, as asked).

The greatest railway strike that had ever occurred in England began at midnight on Sept. 26 1910. An agreement had been made between the Government, the Railway Executive Committee (representing the companies), and the trade unions in March 1910, providing, *inter alia*, for the determination by negotiation of new standard rates of pay for the various grades. Standard rates were agreed upon, in Aug., for drivers and motormen, firemen and assistant motormen, and engine cleaners; and in Sept. the Board of Trade forwarded to the National Union of Railwaymen their proposals for the standard rates of other grades, showing an average advance of 100% on pre-war rates, with a minimum of £2 a week. The Union rejected these proposals, claiming that the new rate should be based on the highest standard rate already existing for each grade, *plus* 33s. war wage, with a minimum of £3 a week. Failing a favourable reply by Sept. 25, they announced an immediate strike. Negotiations continued, and fresh proposals were made by the Government; but the Union did not feel justified in postponing the strike, which accordingly began, as stated, at midnight on Sept. 26. The Associated Society of Locomotive Engineers and Firemen, although not directly concerned in the dispute, supported the National Union of Railwaymen, and its members also ceased work.

On Oct. 1 a conference, arranged by the National Transport Workers' Federation (to which the railwaymen are affiliated), was attended by representatives of the Trades Union Congress Parliamentary committee, of the Labour party, and of a number of other trades besides railways. A mediating committee was appointed, and negotiations were resumed between the Government, the mediating committee, and the National Union of Railwaymen. A settlement was reached on Oct. 5, and work was resumed on the following morning.

The settlement provided for the resumption of negotiations, with the understanding that they should be completed by Dec. 31 1910; and for the stabilization of wages at their then existing level up to Sept. 30 1920 (subject to review at any time after Aug. 1 1920). It was also provided that "no adult railwayman in Great Britain shall receive less than 51s. so long as the cost of living is not less than 110% above pre-war level."

A strike of ironmoulders, coremakers, and iron and steel dressers began on Sept. 22 1919, and lasted until Jan. 12 1920. About 65,000 men were involved in the immediate dispute; but the shortage of castings consequent on the dispute greatly hindered the working of the engineering industry for many months.

The demands of the men were for an advance in wages of 15s. a week for journeymen and 7s. 6d. a week for apprentices. At the settlement on Jan. 12 they accepted an advance of 5s. for men over 18 years of age, the same as had been granted to men in the engineering trades in the previous November. It was also agreed that negotiations should be resumed on the questions of: (1) the general working conditions in foundries; (2) questions arising out of the introduction of the 47-hour week; (3) minimum standard rates for the various districts; and (4) the jurisdiction of the unions over apprentices, and the wages of apprentices.

A strike of all classes of workpeople in the furnishing trades began in the Manchester district and N. E. Lancashire on June 27 1919, in support of a demand for an advance in wages, a working week of 44 hours, and other concessions. On July 26 a lock-out was declared at High Wycombe, Birmingham, Nottingham,

Bristol and other centres, to enforce the termination of the dispute. At most of the centres involved in the lock-out settlements were reached by the end of Oct., advances in wages being granted, in some cases provision was made for the discussion of proposals to introduce sectional work, piece-work, or female labour, where not formerly in operation. The original dispute was also settled at the end of Oct., various advances being granted. At High Wycombe, where the largest number of workpeople was involved, the lock-out was not brought to a close until nearly the end of Nov.; here also advances in wages, varying according to sex and standing and the class of work done, were granted.

The year 1920 was remarkable for one dispute, the national coal strike of Oct. and Nov., the aggregate duration of which was second only to those of the two previous great coal strikes in 1893, and in 1912; and for an unprecedented number of smaller disputes, in a great variety of trades, many of which would have ranked as "great" disputes in a normal year. There were also many minor disputes in the building and in the textile trades. The coal strike began out of a demand put forward by the Miners' Federation of Great Britain (1) for a flat-rate advance in wages of 2s. a shift for all persons of the age of 18 years or over, with corresponding advances for those under that age; and (2) for a reduction of 14s. 2d. a ton in the price of domestic coal. These demands were presented to the Controller of Coal Mines on July 15, and refused by the Government on July 26. A ballot of the Federation showed a great majority (606,782 to 238,865) in favour of a strike in support of these demands; and strike notices were handed in, in every district, to expire on Sept. 25.

Negotiations between the Government and the miners continued, in the course of which the miners dropped their demand for a reduction in the price of domestic coal. The Government, after making various alternative proposals which were not acceptable to the miners, concentrated on the policy of making any advance that might be granted bear some relation to increased output. The miners, however, still pressed for an immediate unconditional advance of 2s. The strike notices were twice postponed, at first for a week and then for another fortnight, in order to allow the negotiations to continue. At this stage the mine-owners were called into conference; and meetings between representatives of the miners and of the mine-owners took place almost daily from Sept. 25 to Oct. 2, inclusive.

During the first fortnight of Oct. a second ballot of the miners took place on certain proposals which had been formulated by the mine-owners at these conferences. These were to the effect that if, during the first fortnight of Oct. there were indications that the output of coal was at the rate of 240,000,000 tons per annum, an advance of 1s. a shift should be conceded as from Oct. 1, with an additional 6d. for each 4,000,000 tons, up to 3s. at 265,000,000 tons. The wages for the remainder of the year would be similarly regulated, and the whole scheme would come up for review at the end of December. The owners also pledged themselves to coöperate with the men in measures for increasing output. These proposals were rejected by the men, on a ballot vote, by a still larger majority (635,098 to 181,428); and work at the mines ceased on Oct. 16, except that certain men were allowed to continue at work for keeping the mines in order.

The strike was debated in the House of Commons on Oct. 10; and tentative suggestions for a settlement were made by Mr. Braco (at that time a member of the executive of the South Wales Miners' Federation), and by other members. Informal conversations, and then formal negotiations, followed between the Government and the miners' representatives, to which at a later stage the mine-owners also were called in; and an agreement was reached on Oct. 28 which the miners' representatives undertook to submit to their members, with a recommendation of acceptance "as a temporary measure." The agreement pledged the miners and the mine-owners to coöperate with the view of increasing output; also to prepare a scheme for the future regulation of wages, "having regard, among other considerations, to the profits of the industry, and to the principles upon which any surplus-profits are to be dealt with." Pending the preparation of this scheme an immediate advance of 2s. a shift was to be granted

to persons of 18 years of age and over, with corresponding advances to persons under that age, and from Jan. 3 1921, until the new scheme was ready, the advance would be automatically adjusted, at monthly intervals, in accordance with the surplus output in excess of 210,000,000 tons a year. The ballot upon these terms showed a small majority against acceptance (346,504 to 338,045), on a reduced total vote; but at the miners' delegate conference at which the result was announced it was decided that work should be resumed on Nov. 4, or as soon after as possible, in view of the rule of the Miners' Federation which requires a two-thirds majority for the continuance of a strike.

A strike in the building trade of Scotland occurred in May, June, and July 1920. During the war wages in the Scottish building trade had been regulated by awards given every four months, as in the engineering and shipbuilding trades. A claim for an advance of 6d. an hour, as from April 1 1920, came before the Industrial Court in March under this agreement, and was refused. The joiners in the west of Scotland, influenced by the high rate of wages given to joiners in the shipyards, had withdrawn from the National Agreement, and claimed the advance of 6d. independently of the other building trades operatives, and, when this award was given, they came out on strike, to the number of about ten thousand. Negotiations with the employers ensued; and at the beginning of July about a third of the operative joiners had obtained their demand for a rate of 2s. 6d. an hour. Bricklayers and masons and their labourers had also obtained an advance in the west of Scotland, but at Edinburgh and Dundee, and in Ayrshire, they were out on strike. As delay to housing schemes was feared through the strike, further conferences were held under the chairmanship of an officer of the Ministry of Labour; and an agreement was reached on July 8 giving all classes of operatives an advance for the period from July 9 to Nov. 30. The parties also agreed to meet again, to consider a scheme for levelling up rates between sections, and for the grading of districts.

Shipyards joiners and carpenters came out on strike on Dec. 1 1920, against a proposed reduction in wages of 12s. a week. (This was the first strike, on a considerable scale, against a reduction of wages since those of 1908, mentioned above.) The employers alleged that the ship-joiners had received a special additional bonus during the preceding time of pressure in the shipyards, over and above that given to other shipyard workers, because it would have been impossible otherwise to obtain the necessary labour, in view of the intense competition from the building trades; and that the exceptional circumstances which had justified the advance had now come to an end. The number involved at the end of Dec. was about ten thousand.

A strike of *piano workers* in London, to the number of about 6,500, began on April 10 and lasted for three months. The employers sought to introduce a system of payment by results, which was objected to by the workers. Work was resumed on the systems of payment existing in each factory; with a provision that a ballot vote should be taken within three months to determine the future system of payment for the entire trade.

A strike of *electricians*, which was of great importance owing to the principle involved, began on July 2 and ended on Sept. 16 1920. The members of the Electrical Trades Union came out on strike at an engineering works at Penistone (Yorks), against the employment of a foreman who was not a member of their trade union. The Engineering Employers' Federation replied by a lock-out of all members of the union employed in federated firms throughout the country. The Government appointed a Court of Enquiry, under the Industrial Courts Act, to enquire into the dispute; but the day after the Court had begun taking evidence the Electrical Trades Union notified to the Joint Industrial Council for the Electricity Supply Industry their readiness to withdraw the question of principle, *i.e.* the claim that foremen must be members of a trade union. The dispute was settled on these lines on Sept. 16, the men withdrawing their strike notices and the employers the lock-out notices. The number of men involved by the lock-out was about seven thousand.

A strike of *shirt and collar makers* in Belfast, Londonderry,

Coleraine, Dublin, and other towns, began on June 12 1920, and lasted for over two months. The cutters only were directly involved, to the number of about 302; but about 17,000 other workpeople were thrown out of work. The cutters demanded higher wages, and the strike was settled by a compromise.

A strike in the spinning branch of the *cotton* trade began at Oldham on Sept. 15 1920. During the war an agreement had been made for the employment of female "creelers" (who carry away the finished yarn) to help the spinners in cases where "little piecers" (boy assistants) were not available, and it was part of the agreement that the spinners should receive extra payments, in compensation for the additional work thrown upon them when "creelers" were employed instead of "little piecers." In Sept. 1920, an agreement was signed between the master spinners and the Operative Spinners' Trade Union withdrawing, in part, these extra payments. A large number of the spinners came out on strike against this agreement, in defiance of the executive of their union. The strike began on Sept. 15, and the maximum number on strike was reached a week later, when the number was about 20,000; and about an equal number of cardroom workers and others were thrown out of work by the dispute. The men gradually went back to work on the terms of the agreement; most of them were back by Oct. 5, but the strike was not quite at an end until the end of that month.

Coal Strike of 1921 The first seven months of 1921 were notable for a rapid and continuous increase in the number of trade disputes concerning proposals for reduction of wages. The strike of shipyard joiners and carpenters against a proposed reduction of 12s. per week, which had begun on Dec. 1 1920, and came to involve directly some 10,000 workpeople, continued until Aug. 1921, when a settlement was reached on the basis of a reduction of 9s. per week, to take effect in two stages. Among other important disputes in this period was the strike in Feb. 1921 of some 5,000 nut and bolt workers in the Black Country against a proposed wage reduction, which lasted five weeks, the employers' terms being then accepted. In March 3,500 vehicle builders and 2,170 waterproof garment finishers came out on strike against proposed reductions of wages; the former dispute lasted four weeks and ended in the acceptance of a modified reduction; the latter lasted five weeks and ended in the acceptance of the reduction on condition that it should take effect in two stages. In June a national engineering strike was threatened but avoided at the last hour, while 10,000 engineering apprentices in the Manchester district struck against a proposed reduction in wages, which three weeks later was accepted. In June, also, a new wages agreement in the cotton textile industry, involving an immediate reduction of about 19% on actual wage rates, was only made after a dispute which lasted three weeks and involved some 375,000 operatives.

None of the strikes of 1921 against proposed reductions in wages compares, however, in magnitude or consequence with the great national coal strike, which began on April 1 and ended on July 1 in an agreement which was to last until Sept. 30 1922, and thereafter, until terminated by three months' notice on either side. The position at the end of the coal strike of 1920 has already been described. Briefly a temporary settlement has been made under which the wages of miners varied according to the total output of coal from the mines of Great Britain: the more the output, the higher were the wages to be received. The miners and owners were under an obligation to prepare a scheme not later than March 31 1921, for the future regulation of wages in the industry, "having regard, among other considerations, to the profits of the industry and to the principles upon which any surplus profits are to be dealt with." The industry was still under Government control, and the "control" powers of the Mines Department of the board of trade did not expire, in any event, until Aug. 31 1921.

The coal industry, however, did not escape the effects of the general industrial depression, which indeed may be dated from the coal strike of 1920. The values of exported coal fell heavily, while the demand for coal for industrial or domestic consumption at home also decreased. The output figures for each of the

four months from Dec. 1920 reflect the changes in the current demand. In the five weeks ended Dec. 25 the output for Great Britain was 25,406,700 tons; while in the five weeks ended Jan. 29 1921, it was 21,803,600 tons. In the four weeks ended Jan. 26 it was 18,540,500 tons; while in the four weeks ended Feb. 26 it was 17,369,100 tons, and in the four weeks ended March 26, 16,435,200 tons. An incidental result of this decreased output was the disappearance as from Feb. 28 of the wages advances granted under the settlement of Nov. 1920. In so far as the position, as affected both by the decreased output and by the reduction in values of export coal, may be judged from the Mines Department statistics, in Feb. 1921 the average loss over the whole of the collieries of Great Britain on every ton of coal disposed of commercially was 5s. 11½d. In two districts, namely Yorkshire, and Derby, Nottingham and Leicester, there were small credits of 3½d. and 1½d. per ton respectively; while the debit balances ranged from 4s. 0½d. per ton in Durham to 18s. 1½d. per ton in South Wales.

In these circumstances the Government decided to terminate their control of the mining industry on March 31. This was the date at which the agreed scheme for the future regulation of wages in the industry was to be ready, but it was five months earlier than the date at which decontrol had been expected. On the one hand, the fall in the price of export coal to such an extent that there was no appreciable difference between the export price and the inland price, made it no longer necessary to regulate the pit head prices and the distribution of coal, and all such regulation was withdrawn as from March 1. On the other hand, the continuance of financial control, which had been a corollary of the regulation of prices and distribution was only involving the Government in heavy financial liabilities. The Coal Mines (Decontrol) Act, 1921, "an act to curtail the duration of and amend the Coal Mines (Emergency) Act, 1920," was therefore passed. The Act received Royal Assent on March 24, and its effect was to terminate the special interest the Government had hitherto had in the Mining Industry, as regards, for example, output and prices, wages and profits. Control at that moment meant financial assistance to the industry, and the removal of that financial assistance on March 31 made the formulation of a new wages agreement a matter of imperative urgency, if the work of the mines was to be continued after decontrol.

The decision of the Government to decontrol was communicated by the president of the board of trade to the mine-owners and miners, i.e. the Mining Association and the Miners' Federation of Great Britain, on Feb. 23. At the time the announcement was made, the Mining Association and the Miners' Federation were in the midst of negotiations with regard to the permanent scheme for the regulation of wages, which under the agreement of Nov. 1920, they were to complete by March 31 1921. On Feb. 25 the two bodies met again, and agreement was reached upon a considerable number of important points. But on one fundamental issue it was found impossible to agree. The representatives of the Miners' Federation insisted upon the necessity of a national wages scheme, with some form of a national pool, for the industry. The representatives of the owners insisted that wages must be based upon the wage-paying capacity of the districts, national discussion being confined to the enunciation of certain general principles which might provide the districts with some uniform method of determining their wage-paying capacity.

A definite conflict of principle had thus occurred. It was clear however that no scheme designed to be permanent would be applicable without modification to the abnormal position in which the industry would find itself on decontrol on April 1. It was therefore conceivable that agreement might be reached on a temporary scheme applicable strictly to the emergency period, leaving the points of difference on the permanent scheme for further discussion. In this way the occurrence of a dispute immediately upon the cessation of control might be avoided. Following upon a joint meeting of the two sides held on March 17, the National Delegate Conference of the Miners' Federation decided to ascertain the opinion of the districts as to whether or

not they were prepared to abandon temporarily the policy of a national wages board and a national pool, and to empower the national executive to proceed with the negotiations with a view to establishing a temporary agreement on a district basis. On March 24 the Conference reassembled to receive the replies of the several districts, and these indicated that a very large majority of the Federation were against the proposal to enter into any temporary agreement on a district basis. There was thus no movement towards the owners' position. Notices terminating on March 31 contracts of employment at the existing rates having already been issued by the owners, the Executive Committee of the Miners' Federation met on March 30, and sent out the following instruction to the districts:—"That all notices must take effect regardless of occupation in every mine and plant in the Miners' Federation." Practically the whole of the men ceased work in accordance with this instruction at the close of the last shift on March 31. There was, however, some divergence in the districts on the question of withdrawing the pumpmen and enginemen who were covered by the official instruction of the Federation. These men were not withdrawn in all cases.

At this stage it may be noted that there were some points of agreement between the owners and miners. The agreement of Nov. 1920, envisaged a permanent scheme for the regulation of wages which would have regard "to the profits of the industry and to the principles upon which any surplus profits are to be dealt with." Working from this basis, by the time of the joint meeting of Feb. 25, four further principles had been agreed upon as follows:—

1. Wages must conform to the capacity of the industry to pay.
2. The receipt of a standard wage should justify a corresponding minimum profit to the colliery undertakings.
3. Any surplus remaining after these, and, of course, the usual working costs, had been met, should be divided between the men and the owners in agreed proportions, the workpeople's share to be an addition to their standard wages.
4. Joint audits of the owners' books by accountants representing each side should be made to ascertain all the data necessary for the periodical determination of wages.

On all other matters arising out of the proposed permanent scheme there were differences of considerable importance between the two sides. The following account of the main differences is based upon the draft agreement approved by the Delegate Conference of the Miners' Federation of Great Britain on March 10 (i.e. at the first available opportunity after the joint meeting of Feb. 25), and the report of the mine owners on the situation which was submitted after approval by the Central Council of the Mining Association, to the president of the board of trade on March 25 (i.e. immediately after the refusal of the miners to enter upon negotiations with a view to a temporary settlement on a district basis):—

1. The miners proposed that there should be established a National Board, consisting of 16 representatives of each side, which should determine all questions of wages and profits affecting the mining industry as a whole, i.e. the national regulation and distribution of wages. The National Board would take over the powers and duties of the existing district conciliation boards with regard to the fixing of general rates of wages. The owners would agree to maintain in production by the means of a national profits fund all existing collieries, and all collieries developed subsequently, until such times as the National Board might decide to the contrary.

On these points, the owners' position was that the idea of a "national profits fund" was abhorrent to them, that they wished district conciliation boards to be the sole authorities for fixing wages, and that national discussions should only deal with questions of principle, so as to provide the districts with a uniform method of determining wages.

2. The miners proposed that the new standard wage should be made up by incorporating all the existing percentage additions to district basic rates with those district basic rates, special allowance being made in favour of the men who were benefiting under the flat rate minimum advance which was guaranteed with the 20% wages advances of March 1920. The owners proposed that the new standard wages should be the district basic rates, plus the percentage additions prevailing in July 1914, plus the percentage additions made consequent upon the reduction in hours from 8 to 7.

3. The miners proposed that against their standard wages should be set, as minimum profits to the owners, a sum amounting in the aggregate to 10% of the sum paid as standard wages. The owners proposed that this figure should be 17%.

4. The miners proposed that any surplus remaining after meeting standard wages, other costs and minimum profits, should be divided between miners and owners in the proportion of 100 to 10. The owners proposed that that proportion should be 80 to 20.

5. The miners proposed that their share of this surplus should be distributed by means of national uniform flat rate additions to their standard wages. The owners proposed that the miners' share of the surplus as ascertained in each district should be distributed as a percentage addition to the standard district rates.

6. Whereas the miners' proposals meant that the whole mining industry in Great Britain should be treated as one unit within which wages would be varied uniformly, the owners proposed to take as the units of uniform variation, the 25 districts among which the collieries of Great Britain are distributed by the Second Schedule of the Mining Industry Act, 1920.

With regard to the question what modifications, if any, might be introduced to meet the abnormal conditions of the period following immediately on control, the owners expressed their willingness to waive their share of the surplus in favour of the workmen, on condition that ascertainment of the proceeds of the industry in each unit should be made at monthly periods during the continuance of the concession; but they insisted that it was inevitable that wages should go down on decontrol. From the miners' point of view it was evident that the introduction of their scheme at that moment might mean the loss to the men of war wage and Sankey wage, and the miners' argument therefore was that the Government's obligation to pay war wage or Sankey award did not cease by the decision to decontrol the trade on March 31. The war wage had been given to meet the increased cost of living when the latter was only 80 per cent in excess of the pre-war figure, and (though the Government rejected this interpretation) under the terms of the award the miners claimed that the wage was liable to revision only when the cost of living fell again to that point. With regard to the Sankey wage, the argument of the miners was that the Government had accepted the Sankey Commission's recommendations for an advance in wages of 2s per day, and if the Government now proposed that these conditions should be abandoned, it would be guilty of a breach of faith. The miners reiterated at all times from Feb. 23 to March 31 their demand that the Government should abandon its decision to decontrol the industry, or at least should continue to subsidize it during the existence of the depression from which it was suffering.

The general argument of the miners at this time was that the situation demanded a full national settlement of the wages and profits problem for the industry. The trade as a whole needed uniform peace and security, and district or local negotiations must result in strife. The workmen and their families had to live in the poor districts as well as in the rich, and for uniform expenditure of energy there should be uniform reward. This had been recognized by the Government, first by the payment of uniform war wages to meet the increased cost of living, and, secondly, by the acceptance of the decision of the Sankey Commission to raise uniformly the wages of all coal miners to meet the agreed case for a uniform advance in their standard of living. A National Wages Board, exercising the right to distribute nationally both wages and profits, need not necessarily result in a uniform profit for all undertakings, but by means of a small levy upon the total tonnage raised in every mine, money would be made available for maintaining poor collieries in production as long as their coal was in demand.

The view of the owners, on the other hand, was that the wide variations in the losses of different coalfields made anything in the nature of a national settlement of wages impossible. While there were such divergencies between district and district, each district must determine its own wages by its ability to pay, and the individual who could not pay the wages so determined must decide for himself whether to close his pits or to bear the loss. The country could not afford to keep unprofitable pits working.

From the opening of the strike on April 1, four whole months passed before an agreement between the owners and miners was reached. The first difficulty to secure a resumption of negotiations encountered was in the Government insisting that the first subject to be discussed should be the return of the safety men to the mines, while the miners held that negotiations were useless

if their demands for a wages settlement along national lines, and a national profits' pool, were totally unacceptable. But the influence of the other members of the Triple Alliance secured a modification of both points of view, and joint negotiations were resumed on April 11 and 12. On April 12 the view of the Government was outlined that, while the miners' demand for a national settlement of wages might be practicable, their demand for a national pool of profits was impracticable. A pooling arrangement for the equalization of wages in the industry was declared not to be possible without the resumption of complete and permanent control by the State of the mining industry. A national settlement of wages, however, was suggested, by which the 2nd, 3rd, 4th and 5th points at issue between the owners and miners as outlined above should be determined by the joint conference, whilst subsequent differences of interpretation should be referred to a national joint committee of owners and miners. The Prime Minister explained the Government's proposals as regards the abnormal period following upon decontrol, as follows:—

"If and when an arrangement had been arrived at between the coal owners and the miners as to the rate of wages to be paid in the industry, fixed upon an economic basis, the Government would be willing to give assistance, either by loan or otherwise, during a short period, in order to mitigate the rapid reduction in wages in the districts most severely affected."

These proposals were fully discussed, but the miners' officials intimated their inability to accept them or to abandon their former position, and the conference thereupon ended. This failure at once brought to a head the question whether the other two members of the Triple Alliance, namely, the National Union of Railwaymen¹ and the National Transport Workers' Federation, would take sympathetic strike action in support of the miners. A general meeting of the National Union of Railwaymen, and a full conference of the executives of unions affiliated to the National Transport Workers' Federation, were summoned, and remained in session until April 16, when the question of sympathetic action was finally settled. The mediatory efforts of the railwaymen and transport workers on April 9, which secured the resumption of negotiations between owners and miners, had been supported by a decision that a sympathetic strike should take place on the night of April 12 unless negotiations between the miners, owners and Government were reopened before that date. This strike of April 12 was avoided by the resumption of negotiations on the 11th, but on the 13th, the day after the failure of the resumed negotiations, the railwaymen and transport workers determined to strike at 10 P.M. on April 15 in support of the miners. This sympathetic strike of April 15 was avoided, however, at the last moment. In the late evening of the 14th a group of private members of the House of Commons, after hearing a statement by Mr. Evan Williams, president of the Mining Association, dealing with the effect on the miners' actual earnings of the owners' proposals, invited Mr. Frank Hodges, the secretary of the Miners' Federation, to make a similar statement on behalf of the miners. In the discussion which followed his speech, it was understood from Mr. Hodges that the miners would be prepared to discuss a temporary wages settlement, provided that a period of time were fixed for the negotiation of a permanent settlement, to contain the principles of a national pool and a national wages board. The Prime Minister was at once communicated with, and on the following morning he invited owners and miners to meet him again for a further consideration of the wages question. The executive of the Miners' Federation, to general surprise, abruptly declined this invitation, and Mr. Hodges, whose "offer" was thus ignored, tendered his resignation (though it was afterwards withdrawn). The leaders of the railwaymen and transport workers, however, in these circumstances decided not to proceed with the sympathetic strike, and a breach was created in the Triple Alliance.

The next stage in the history of the dispute was a second series of joint negotiations between owners and miners, from April 22

¹ The Associated Society of Locomotive Engineers and Firemen before the close of this episode joined the other railwaymen and the transport workers in the discussions and the decisions on the question of sympathetic strike action.

to 28, as a result of a further invitation from the Prime Minister. This conference produced a further set of proposals from the owners, and the first detailed proposals for a settlement made by the Government in the course of the dispute, but these were rejected on the 28th by the National Delegate Conference, on the ground that they did not concede "the fundamental principles of a National Wages Board and a National Pool." No definite progress had been made as regards the proposed establishment of a permanent scheme for the regulation of wages in the industry. The Government suggested that the period of the permanent scheme should be one year from the close of the temporary period, subject thereafter to 3 months' notice on either side. This suggestion became part of the final settlement of July 1. They declared that a national pool or levy would involve legislation and must be regarded as a political issue; but they would accept a "National Wages Board" entrusted with the tasks of drawing up a schedule of districts and determining the principles by which wages should be adjusted in the districts, as well as with the duties of interpretation. The owners also spoke at this time of "areas" rather than "districts," the "areas" being the six divisions of Great Britain, among which the 25 districts are distributed by the Second Schedule of the Mining Industry Act, 1920. On the other hand, as a result of the statements of the owners and the Government, substantial progress was made with the preparation of a detailed temporary scheme for the emergency or abnormal period. The main points of these proposals may be summarized as follows:—

1. The duration of the temporary scheme was to be three months.
2. In each of the three months, a maximum sum per shift should be fixed, and the wages of no miner should be reduced by more than that maximum sum. The maximum reduction would be expressed as a national flat rate.
3. For the first month a maximum reduction of 3s. per shift was proposed and for the second month, one of 3s. 6d.
4. The Government were prepared to make a grant of £10,000,000 as their share in the cost of the scheme, and it was suggested that a portion of this grant might be carried forward into a fourth month.
5. The owners were prepared to waive all share in the surplus in any area, if the taking of that share would have the effect of reducing the rates of wages in one month as compared with the previous month. This was an elaboration of the proposal of the owners as regards the emergency period given above, and made public on March 25.
6. The owners were also prepared to agree that, during the period of the temporary scheme, deficiencies in standard profits should not be carried forward from one accounting period to another.

The miners, however, were as much opposed to this proposed temporary scheme as to the owners' permanent scheme. They could not accept a temporary settlement which was related to district settlements; they could not accept reductions which would force their wages below the cost of living level; and they maintained their demand that the Government should render financial assistance to the industry so as to prevent this occurring. On a cost of living basis they argued that the maximum reduction in the first place should be 2s. per shift; whereas the Government proposed a first reduction of 3s. per shift.

From the close of the second series of joint negotiations on April 28, a whole month elapsed before official negotiations were resumed. A third series of negotiations was then begun on May 27, an address being made by the Prime Minister to a joint assembly of the central committee of the Mining Association and the executive committee of the Miners' Federation. Proposals for a settlement were submitted by the Government separately to the two sides on May 28, and on June 3 the observations of owners and miners on these proposals were communicated to the Prime Minister. The reply of the Miners' Federation, drawn up by their executive committee, was to the effect that in every instance the districts had rejected the proposals. On June 4 the Prime Minister announced that the Government's offer of a grant of £10,000,000, intended to mitigate the reductions in wages and allow of a gradual scaling down of wages until they reached an economic level which the industry could sustain, would be withdrawn unless a settlement were reached within 14 days. This announcement was followed by joint meetings between owners and miners on June 6, 7, 8 and 9, and on June 10 the National

Delegate Conference of the Miners' Federation adopted a recommendation of their executive to refer the alternative courses of action to a ballot vote of their members. The alternatives were put to the men as follows:—

- "(1) Are you in favour of fighting on for the principles of the National Wages Board and National Pool, with loss of Government subsidy of £10,000,000 for wages if no settlement by June 18 1921?"
- "(2) Are you in favour of accepting the Government's and owners' terms as set forth on the back of this ballot paper?"

The result of the vote was known on June 17: the first question was answered in the affirmative by 435,614 members, and the second question by 180,725. The previous decisions of the representative bodies of the Federation were thus emphatically confirmed. The Government therefore announced their withdrawal of the proposed subsidy, and the basis for a temporary settlement had for the time being disappeared.

From the point of view of the final settlement, however, this third series of negotiations was important for the modifications which were made in the owners' permanent scheme. The owners definitely adopted the Government suggestions regarding the duration of the permanent scheme and the establishment of a National Wages Board; they proposed the establishment of similarly constituted district boards to determine district questions, they accepted a proposal made by the Government that if the rates of wages as fixed under the permanent scheme did not provide a subsistence wage to low-paid day wage workers, additions in the form of allowances per shift worked should be made by the decision of the district wages boards, and they were prepared to guarantee that the miners should receive during the first year of the agreement a minimum percentage addition of 20% to the standard wage as proposed by the owners.

The final period from June 17 to July 1 was remarkable for the marked changes in the attitude of the executive of the Miners' Federation. On June 18 an invitation was issued to the executive committees of all unions affected by wages disputes to meet the miners' executive at the earliest possible date, with the object of taking joint national action with the miners to secure their several demands. The meeting was arranged for June 25. Meanwhile the annual conference of the Labour party held at Brighton on June 21-4 showed plainly that no support for extended militant action would be given by other trade unions. The projected meeting of June 25 was therefore abandoned, and the Prime Minister was again approached by the miners' executive with a view to securing a satisfactory wages settlement. Joint negotiations between miners and owners were accordingly resumed on June 27, and on the evening of that day it was reported to the Government that an agreement had been reached, upon the assumption that the Government would reopen their offer of a grant of £10,000,000 to the industry. On June 28 the Government expressed their willingness to subsidize wages as required, during the temporary period, up to a maximum of £10,000,000. The miners' executive then referred the proposed terms to their districts; and their recommendation that the terms should be accepted was indorsed at the district meetings. On July 1 the final agreement between the Miners' Federation and the Mining Association was signed, the House of Commons voting, on the same day, a subsidy in aid of wages in the form offered by the Government on June 28. Work in the coal mines throughout Great Britain was resumed as rapidly as the circumstances at each colliery permitted.

The agreement largely incorporated the terms of the interim proposals. With regard to the temporary period of three months, it was agreed that the maximum national flat-rate reductions should be 2s. per shift in the first month, 2s. 6d. in the second month, and 3s. in the third month; and that, in those districts where it was not necessary to enforce the full maximum reduction, the wages payable during the temporary period should be calculated in terms of uniform district flat-rate reductions, and not in terms of basis rates *plus* percentages. On the other hand, the Government subsidy was now a maximum sum, and any balance not issued in respect of the temporary period of three months was no longer available to ease any further reductions

which might be necessary in the fourth month after the settlement. With regard to the permanent scheme the settlement provided that standard profits should be 17% of standard wages, and that 83% of the surplus proceeds should be applied to the payment of wages above the standard rates. The duration of the guarantee that the miners should receive a minimum percentage addition of 20% to the standard wages, was extended from one year to the whole period of the permanent scheme. In other respects the permanent scheme was the one first outlined by the owners before the beginning of the strike, but it included the important modifications and safeguards introduced in the course of the third series of joint negotiations.

The outbreak of the strike had led to the Government passing an Emergency Powers Act into law, to enable exceptional provision to be made for the protection of the community when "any action has been taken, or is immediately threatened by any person or body of persons, of such a nature or on so extensive a scale, as to be calculated to deprive the community, or a substantial portion of the community, of the essentials of life." On March 31 a proclamation was made under this Act declaring a "state of emergency" to exist, and by successive renewals at monthly intervals the "state of emergency" was continued until the settlement of July 1. Within this general period a state of more intense emergency occurred from April 8 to June 2. During this latter period the Reserves were embodied, and in addition to the enrolment of special constables, a Defence Force was enlisted with the object of supporting the police in providing protection to volunteers who were maintaining the mines in condition, or who might be required to carry on transport work in the event of the extension of the coal strike to railway and transport services. During the state of emergency, a series of emergency regulations were in force under which the Mines Department of the board of trade controlled the supply, consumption and movement of coal, and the police authorities in the various parts of the country were endowed with special powers for the suppression of sedition.

(B) FOREIGN COUNTRIES

A brief account is given below of the most recent statistics of the strikes and lock-outs in the principal European countries, other than the United Kingdom, available in 1921.

France—Detailed statistics of strikes and lock-outs for the years 1890 to 1912 and summaries for the years 1913 and 1914 had been published by the French Ministry of Labour. The following are the totals for the years 1907-14.—

Year	Number of Disputes	Number of Workpeople directly affected	Aggregate Duration in Working Days
1907	1,279	198,136	3,563,237
1908	1,104	124,248	2,307,120
1909	1,036	169,509	3,581,928
1910	1,511	290,899	4,887,837
1911	1,474	230,795	4,037,475
1912	1,120	268,230	2,335,891
1913 ¹	1,073	220,448	2,223,781
1914 ¹	672	160,566	2,192,078

¹ The figures for the years 1913 and 1914 relate only to strikes.

The principal groups of industries affected by the disputes were in 1907 the transport group involving 43,248 workpeople; in 1908 and 1909 the building trade group involving 56,691 and 42,658 workpeople respectively; in 1910 the transport group involving 83,025 workpeople, and the building group involving 75,695 workpeople; in 1911 the building group involving 93,660 workpeople; and in 1912 the mining and quarrying group involving 137,602.

During the years 1907 to 1912, 46% of the total number of workpeople affected were involved in disputes concerning wages, 19% in disputes concerning hours of labour, 10% in disputes concerning the employment of particular classes of persons, 11% in disputes concerning working arrangements and the remaining 14% in disputes due to other causes. The results of disputes during the period under survey were as follows: disputes involving 12% of the total number of workpeople directly affected terminated in favour of the workpeople; disputes involving 44% in favour of the employers; those involving the remaining 44% in a compromise.

Germany.—From 1899 statistics of strikes and lock-outs other than in agriculture have been published annually by the German Federal

Statistical Office. The figures for the period 1907 to 1918 are summarized below:

Year	Number of Disputes	Number of Workpeople directly or indirectly affected
1907	2,512	280,016
1908	1,524	119,781
1909	1,652	130,883
1910	3,228	390,706
1911	2,798	385,216
1912	2,834	493,749
1913	2,464	323,394
1914	1,223	98,339
1915	141	15,238
1916	240	128,881
1917	562	668,032
1918	772	1,325,807

The principal groups of industries affected by disputes in 1913 were the metal and engineering group involving 81,025 workpeople, the mining and smelting group involving 78,221 workpeople, and the building trades group involving 69,899 workpeople. In 1918 the principal groups were the mining and smelting group with 336,378 workpeople involved, and the metal and engineering group with 279,921 workpeople involved.

Of the total number of disputes occurring during the period 1907-18, 52% arose on questions of wages, 16% on questions of hours, and the balance on questions of the employment of particular classes of persons, working arrangements and miscellaneous matters. During the same period 15% of the total number of disputes were settled in favour of the workpeople, and 39% in favour of the employers, while 46% were compromised.

Belgium.—Statistics of strikes and lock-outs are published by the Belgian Ministry of Industry, Labour and Supplies. The table given below shows the number of strikes and lock-outs, and the number of workpeople directly affected, in the period 1908 to 1919, with the exception of 1914 to 1918.

Year	Number of Disputes	Number of Workpeople directly affected
1908	118	17,085
1909	123	23,469
1910	110	27,257
1911	162	57,203
1912	206	63,772
1913	167	23,752
1919	372	164,030

The mining and quarrying and the textile industries accounted for 6,096 and 3,114 respectively of the workpeople affected in 1908, for 6,456 and 2,846 of the workpeople affected in 1909, for 21,103 and 2,388 in 1910, for 34,417 and 9,089 in 1911, and for 38,479 and 5,856 in 1912. In 1913 the textile industry accounted for 10,158 of workpeople affected, and in 1919 the mining and quarrying industry for 99,035 of the workpeople affected. The causes of the disputes during the period 1908-13 were mainly questions of wages, 52% of the workpeople being involved on this account. Of the total number of strikes during the same period 13% ended in favour of the workpeople, 59% ended in favour of the employers, and 28% resulted in a compromise.

Holland.—Statistics of disputes in Holland are published by the Central Statistical Bureau. The figures for the years 1907-19 are given in the table below:—

Year	Number of Disputes	Number of Workpeople directly affected	Aggregate Duration in Working Days
1907	154	15,154	4,366,691
1908	135	7,165	91,860
1909	189	8,455	272,013
1910	146	13,238	334,595
1911	217	20,005	435,992
1912	283	21,672	367,751
1913	427	30,161	787,876
1914	271	25,569	361,400
1915	269	15,179	165,247
1916	377	18,127	249,442
1917	344	31,317	526,507
1918	325	39,640	607,236
1919	649	61,667	1,051,884

During the period 1911-5 the proportion of disputes due to questions of wages was 55%; it was 58% in 1916, 55% in 1917, 57% in 1918, and 58% in 1919. The results of the disputes during the period 1910-9 were as follows:—22% ended in favour of the workpeople, 28% ended in favour of the employers; 44% were compromised; and 6% were either indeterminate or the result unknown.

STRIKES AND LOCK-OUTS

Sweden.—The Swedish labour department has published statistics of strikes and lock-outs since 1903. Figures for 1908 to 1919 are shown below:—

Year	Number of Disputes	Number of Workpeople directly affected
1908	302	40,357
1909	138	301,749
1910	76	3,671
1911	98	20,576
1912	116	9,980
1913	119	9,591
1914	115	14,385
1915	80	5,119
1916	227	20,711
1917	475	46,701
1918	708	61,223
1919	440	81,041

Of the disputes recorded during the period 1910-9, 63% were caused by questions of wages. In the same period 28% of the disputes were settled in favour of the workpeople, 28% in favour of the employers, and 42% were compromised.

Spain.—Statistics of strikes are published annually by the Spanish Institute of Social Reforms. The figures for 1905-18 are given below:—

Year	Number of Strikes	Number of Workpeople directly affected
1905	130	20,176
1906	122	24,394
1907	118	12,671
1908	127	12,748
1909	78	6,683
1910	151	35,897
1911	118	22,154
1912	169	36,306
1913	201	84,316
1914	140	40,267
1915	91	30,591
1916	178	96,882
1917	176	71,440
1918	256	109,168

Questions of wages were the main causes of 48% of the strikes during the period 1910-8. In the same period 32% of the strikes terminated in favour of the workpeople, 34% in favour of the employers and 34% were compromised. In 1918, 29% of the workpeople directly affected were employed in agriculture and cattle breeding, 11% in the textile industry, 10% in the mining industry, and 9% in both metal and engineering and clothing trades.

(C) BRITISH DOMINIONS

Canada.—Statistics of disputes are published by the Department of Labour. The following table shows the number of disputes, the number of workpeople involved and the aggregate duration in working days during the years 1908-19:—

Year	Number of Disputes	Number of Workpeople directly or indirectly affected	Aggregate Duration in Working Days
1908	68	25,293	708,285
1909	60	17,332	871,845
1910	84	21,280	718,635
1911	99	30,094	2,046,650
1912	150	40,511	1,099,208
1913	113	39,536	1,287,678
1914	44	8,678	430,054
1915	73	9,140	106,149
1916	75	21,157	208,277
1917	148	48,392	1,134,970
1918	196	68,489	763,241
1919	298	133,988	3,942,189

Of the 449 disputes recorded during the period 1911-5, 128 occurred in the building trades, 103 in the metal trades, 51 in the clothing trades, 39 in the general transport trades and 29 in the mining industry. The majority of the disputes during the same period were due to questions of wages and hours, about 70% of the disputes being due to this cause. With regard to the results of the disputes during this period 139 or 30% resulted in favour of the workpeople, 164 or 36% in favour of the employers, 79 or 17% were compromised and in the remaining 67 cases the result was indefinite.

In 1919 the industry most affected by disputes was the metal and engineering, in which there were 45 strikes, involving 70,268 workpeople and a time loss of 1,993,704 working days. Forty

strikes, involving 10,779 workpeople and resulting in a loss of 287,146 working days, occurred in the building trades. Of the 298 disputes recorded in 1919, 223 were due to wages. In the same year 157 of the disputes terminated in favour of the workpeople, 88 in favour of the employers and 23 were compromised.

Australia.—The systematic collection of statistical data regarding strikes and lock-outs in Australia was initiated by the Commonwealth Bureau of Census and Statistics at the beginning of 1913.

The following table shows the number of strikes and the number of workpeople directly and indirectly affected in the years 1913-9:—

Year	Number of Disputes	Number of Workpeople affected
1913	208	50,283
1914	337	71,049
1915	358	81,292
1916	508	170,683
1917	444	173,970
1918	298	56,439
1919	460	157,591

In 1919 the total number of working days lost on account of strikes and lock-outs was 5,652,726. (J. H.)

(D) UNITED STATES

In Nov. 1909, more than 25,000 shirt-waist makers struck in New York City; in July 1910 the cloak and suit makers in the same city; and in Oct. the men's clothing workers in Chicago. These strikes were remarkable for the numbers involved, and for the plans of adjusting grievances which resulted.

The joint agreement of the bituminous mine operators with the United Mine Workers expired April 1 1910. Disagreements as to district boundaries prevented its renewal without friction. On April 1 about 300,000 miners struck. In most districts the operators soon granted the wages increases demanded. Some 45,000 miners remained out. In July the union concluded an agreement with the remaining operators, only to have it rejected by referendum of the strikers. The miners returned to work in Sept.; the union had paid out \$674,216 in strike benefits. The same year, in Columbus, O., the street-railway employees struck three times, in April, May and July, because of discharges of union members. The state Board of Arbitration considered the company responsible. The strikes were marked by violence, much of the company's property was destroyed and a number of lives were lost. Twice the militia were used to restore order.

In 1912 there were strikes led by the Industrial Workers of the World among the silk workers of New Jersey, the lumbermen in Louisiana, and the textile workers in Lawrence, Mass. (See TRADE UNIONS.) The Lawrence strike lasted for nine weeks and affected 12 mills. On Jan. 11 about 14,000 employees walked out, and during the strike the number increased to 23,000. The cause of the strike was the announcement by mill owners, when the state law went into effect limiting the hours of women and children to 54 a week, that the reduction in hours would not be accompanied by an increase in the hourly rates of pay. At the beginning of the strike only a small number of the operatives were organized; the paid-up membership of the I.W.W. in Lawrence was not more than 300. During the strike the I.W.W. claimed 14,000 members; but the next year the membership had dwindled to one-half. Violent acts by strikers, greatly exaggerated by the press, and violent acts by deputies, police and militia, scarcely mentioned by the press, embittered the struggle. Early in the strike Haywood, Ettor and Giovannitti, I.W.W. organizers, went to Lawrence. Their coming resulted in a reduction of violence, for they preached passive resistance; however, threats to prevent strikebreakers from working probably continued. A business man of Lawrence, not connected with the strikers, was arrested and fined for placing sticks of dynamite in various parts of the town, presumably to discredit the strikers. The American Federation of Labor contributed \$11,000 to the strike relief fund, the Socialists \$40,000 and the I.W.W. \$16,000. Two hundred children of the strikers were sent to New York to be fed by other workers in order that their parents might hold out longer. Ettor and Giovannitti were arrested in connexion with the murder of a woman, and used their trial for propaganda. The I.W.W. urged a general boycott of Lawrence. As a result of the strike 30,000 employees received wages increases of from 5%

to 20%, and an increased rate for overtime. The largest increases were given to the unskilled workers.

The anthracite coal strike, beginning March 31 1912 lasted seven weeks. About 170,000 men and boys were out. The results were wages increases, abolition of the sliding scale and provision for a grievance committee. A strike of the coal-miners of Paint Creek and Cabin Creek in W. Virginia lasted from April 1912 to July 1913, and was marked by violence and lawlessness. Thirteen lives were lost. It has been estimated that the employers lost \$2,000,000 because of the strike, the strikers \$1,500,000 in wages and that the strike cost the taxpayers of the state or county \$500,000. Miners in other states contributed \$602,000 to the strike fund. The U.S. Senate ordered an investigation.

In 1913 business was active, the cost of living was rising, and there were many strikes. A strike of silk workers in Paterson, N.J., beginning in Feb. involved 293 establishments and over 25,000 workers. The strike was in protest against the introduction of the three- and four-loom system, and to enforce shorter hours and increased wages. After the strike began, the I.W.W. sent in their leaders. They succeeded in holding the workers together during the five months of the strike. The attempt by the American Federation of Labor to organize the workers and effect trade agreements with the employers failed. The strike was lost through exhaustion of the workers. A strike in the copper mines of upper Michigan, for recognition of the Western Federation of Miners and to compel the enforcement of certain state laws, began in the summer of 1913 and lasted until April 1914. The men were taken back with the promise of wages increases and reduction of hours, but on condition that they give up membership in the union.

In Sept. 1913 a strike broke out among the employees of the Colorado Fuel and Iron Co. for recognition of the United Mine Workers' Union, wages increases and the enforcement of state mining laws. In Dec. a Federal grand jury indicted many of the union officials for violating the anti-trust Act by trying to create a monopoly of labour. Mine operators were also indicted for violating state mining laws. In Jan. 1914 the Federal House of Representatives ordered an investigation. Early in the strike the state militia had been sent in and martial law declared. Both sides were guilty of violence. The strikers had moved from the houses owned by the company to tent colonies on land leased by the union. One of the largest of these was at Ludlow. On April 20 1914 militia fired into the tents, which were ignited, and 7 men, 2 women and 11 children perished. Each side accused the other of initiating the attack. John D. Rockefeller, Jr., on behalf of the employing company, refused to go to arbitration with the union, which he believed to be controlled by eastern agitators. President Wilson then sent 2,000 Federal troops to restore peace. They took the place of the militia, who withdrew, and disarmed the strikers and mine guards and deported the strikebreakers. In Sept. President Wilson proposed that the company should take back the strikers not guilty of violence and establish grievance committees and a committee of appeals to effect arbitration. The proposal was accepted by the miners but rejected by the operators. Early in Dec. 1914 the President appointed a commission to settle future disputes in the Colorado mines, made up of representatives of the employers, the union and the public. The union then voted to call off the strike and on Dec. 30 part of the Federal troops were withdrawn. At no time during the strike did the directors of the company visit the property, but after investigation by the U.S. Commission on Industrial Relations, John D. Rockefeller, Jr., visited Colorado. The result was the introduction of a system of employee representation. The miners voted to accept the plan, which provides for annual election, by the workers in each camp, of representatives to meet in conference with the employers' representatives. Each district conference names committees on conciliation, safety, sanitation, health and housing, education and recreation. A supervisor of welfare work was appointed. The workers were granted the basic 8-hour day and check-weighmen. A promise was given that union men would not be discriminated against, but the union was not recognized.

A lock-out of 16,000 coal-miners in Ohio which lasted more than a year was settled in May 1915, by Federal mediation. For a year after the war broke out in Europe, business was depressed in the United States, and many workers were competing for employment; but with increasing demand for labour on war contracts strikes again became numerous. In 1915 there were 102 strikes and 6 lock-outs of machinists in the four months July to Oct.; in nearly every case the basic 8-hour day was gained. In 1916 there was rioting in connexion with strikes in the oil refineries at Bayonne, N.J., of iron and steel workers in East Youngstown, O., and of 30,000 workers of the Westinghouse Electric Co. in Pittsburgh. Unorganized iron miners on the Mesaba range in Michigan were on strike from June to October. In the same year there were also strikes of longshoremen on the Pacific coast, and street railway employees in several cities. Coal strikes affected 350,000 men. Some 10% of the strikes that year were in New York City where more than 300,000 workers were out, chiefly in the garment trades.

After the United States entered the war the American Federation of Labor discouraged strikes in essential industries. Disputes were settled by negotiation. A number of strikes did occur, however, in some cases involving large numbers of workers; the great majority were settled by Government committees. Those responsible for war labour administration were of the opinion that the period of the war should be one of truce in the industrial field. Demands for closed shop or for radical social change were barred. The truce was not always respected by workers or employers, but on the whole it was adhered to. Local machinists' unions in Bridgeport and Newark came under radical socialist leadership. As many of the Allies' war orders were placed in Bridgeport there was great demand for machinists and the town became overcrowded. The men were dissatisfied because their pay was lower than that of men in the shipbuilding yards, and because employers discriminated against the unions. In the summer of 1917 the men demanded the 8-hour day, 10% increase in wages with certain minimum rates of pay for each class of workers, right of union membership and shop committees for the adjustment of grievances. The answer of the employers was to ask the U.S. attorney-general for criminal action. Various Federal agents were sent to Bridgeport but were unsuccessful in preventing the strike which occurred in May 1918. The strikers, however, were persuaded by the Federal mediator to return to work. Hearings were held in Washington before a special board of the Ordnance Department, and on June 8 the award was made public. After some protest the workers accepted it, but the employers refused, with the result that the men again went out on strike June 26. The War Labor Board took up the matter, but unsuccessfully, an umpire was appointed, who granted the 8-hour day, arrangements for collective bargaining, and wages increases for the most poorly paid workers, but not classification of workers with minimum wage rates. The men felt that the Government should have sustained its earlier award, and they refused to accept the second, which seemed to them to be a compromise with the employers. A third time they went out on strike. President Wilson then wrote to the strikers threatening that unless they returned to work immediately, they would be refused employment in any war industry in their community, they might not claim draft exemption on the grounds of employment in an essential industry, and that the U.S. Employment Service would refuse to find them work in other localities. On Sept. 17 1918 the men voted to return to work. The President also required the employers to reinstate all strikers. The collective bargaining machinery provided by the award never functioned.

In the summer of 1917 the entire lumber industry of the north-west was disorganized by strikes. The chief demand was for the 8-hour day. The President's Mediation Commission was unsuccessful in its attempt to settle the difficulties. The employers continued the 10-hour day, but they had difficulty in keeping men, and those who did accept employment practised sabotage. In the shipyards workers refused to handle "10-hour lumber." These conditions continued until Col. Brice P. Disque, sent into

the field by the "spruce division" of the War Department, effected the organization of the Loyal Legion of Loggers and Lumbermen made up of both employers and employees and with the aim of improving conditions by mutual agreement. Members signed a pledge of loyalty to the U.S. Government. On March 1 1918 the employers introduced the 8-hour day without reduction of wages. A sanitary survey of the camps was instituted, and other improvements in living conditions were made. Labour turnover decreased and output increased considerably. Although at first it had aroused suspicion, the organization won support of most of the employers and men, but both A. F. of L. unions and I.W.W. continued to oppose it.

In many places the public, in sympathy with the employing interest and angered by the philosophy of the I.W.W., attempted to prevent strikes by arresting labour organizers as these came into a locality. Some were thrown into jail and sometimes kept there for long periods without trial. Among the strikes in connexion with which violence occurred were those of the miners in Arizona, in 1917, who struck near Jerome (May) and Bisbee (June) and also in two other districts. The chief demands were for higher wages and grievance committees. Mine owners charged the I.W.W. as responsible, although an A. F. of L. international union was actually in charge of the strike. About 100 miners were deported from Jerome by the employing interests, in cattle-cars. The train was turned back at the California state line, and the men were kept in jail for three months. On July 12 1917 in Bisbee, 1,200 strikers were dragged from their beds by armed citizens, compelled to march, and then confined in a ball-field and loaded on cattle-cars. The train was sent through the desert until taken over by soldiers camped at Columbus, N.M. Here they lived on army rations for three months, and then scattered. One-third of these men were members of the I.W.W. In July 1919 county officials arrested 107 men, prominent citizens of Bisbee, charged with kidnapping and assault, in connexion with the deportations of two years before. Civil suits for damages were filed against mining companies and the railways by the men who had been deported, these were settled out of court.

In the six months following America's entrance into the war 3,000 strikes were reported; in the first six months of 1918 the number was 1,771. When the Armistice was signed, the War Labor Board had on hand several hundred cases awaiting hearings. Now that the national emergency had passed, many employers and employees ceased to cooperate. Strikes began again. As in 1916 and 1917, the greatest number of strikes in 1918 and 1919 were in the metal trades, building, clothing, textile, transportation and mining. The largest number of workers in any one strike in 1916 was 60,000, in the men's clothing strike in New York; in 1917 no strike involved as many as 40,000; in 1918, 60,000 machinists were on strike in northern New Jersey. The strikes of 1919 were remarkable for the number of workers included; the total number was reported to the Bureau of Labor Statistics as 4,112,507. Not many strikebreakers were employed; the labour reserve was still depleted owing to business prosperity of the war period. Many of the larger strikes occurred in New York City and its vicinity; 176,000 struck in the clothing trades; 150,000 textile workers in New Jersey and New England; 16,000 marine workers struck in New York harbour in Jan., 17,000 in March; and 20,000 longshoremen in March. In July 40,000 marine workers of the Atlantic coast struck; 100,000 were out sometime during the year. In 1919, also, 65,000 struck in the stock-yards in Chicago; 100,000 in the shipyards of New York and vicinity; 151,000 in the New York building trades; 43,000 anthracite miners in Pennsylvania.

After the Armistice, war labour adjustment boards, one after another, were dissolved. Workers who had been prevented from striking by the promise of peaceful settlement of grievances, felt that the Government and employers had broken faith. The result was widespread unrest, and a number of spontaneous strikes by the rank and file of union membership, not authorized by the union officials. Demands both for the closed shop, and for the open shop were pushed without thought of compromise. Employers discriminated against union men, and recourse was

had to force. In accordance with a resolution of the convention of the A. F. of L. in June 1918, the 24 international unions which claimed jurisdiction over the trades in the steel industry co-operated to organize all the workers in that industry. Mass meetings were held in Sept. in mill towns. The companies replied by discharging union members; the U.S. Steel Corp. ignored the request of President Gompers of the A. F. of L. for a conference. On July 20 1919 the committee of the 24 unions decided to submit a strike vote to their membership. Twelve demands were made. The real issue was recognition of the union. Wages in the industry were high, but the hours long. In 1911 the stockholders of the Steel Corp. had ordered an investigation of conditions of work. The report showed that 50% to 60% of the employees in rolling-mills, open hearth and blast furnaces worked a 12-hour day. The committee recommended a reduction in hours, but the recommendation was quashed by the finance committee. In Sept. 1918 the basic 8-hour day was granted, which resulted in increased pay, not shorter hours. The communities in which steel workers lived were ruled politically by company influence. In W. Pennsylvania organizers were denied free speech and assemblage by local authorities. The unions voted to strike. The call to strike on Sept. 22 1919 was published in seven languages, to all workers in iron and steel mills and blast furnaces not bound by trade agreements. The companies prepared for battle. At McKeesport alone 3,000 citizens were sworn in as special police subject to instant call. The mills of the Pittsburgh district were fortified and provisioned. On Sept. 21 rioting and arrests began. The next day 365,000 men stayed away from work. The state constabulary were sent in. Gradually the men went back to work. On Jan. 8 1920 the national committee for organizing the workers permitted the 100,000 men still out to return to the mills. Those who were taken back were required to give up their union cards. The national committee reported that 156,702 union members paid initiation fees between Aug. 1 1918 and June 31 1920, and estimated at 250,000 the total number organized.

February 6 to 11 1919 there was a general strike in Seattle Wash., involving 60,000 persons, in sympathy with shipyard employees who were striking for an increase in pay. The general strike was carried out by craft unions of the A. F. of L., although I.W.W. propaganda in the interest of industrial solidarity may have helped to put the workers into the spirit for such a mass demonstration. On the first day 110 unions stayed out; some workers had permits from the strike committee to work in the interests of public health and safety; garbage was collected and milk was delivered to distributing stations. A Labour guard patrolled the streets to preserve order. The business men viewed the strike as a "revolution." The mayor announced that unless the strike were called off on the morning of Feb. 8, he would declare the city under martial law. This threat was not carried out, although citizens armed themselves, and the governor sent troops and machine-guns. On Feb. 11 the strike was called off. Workers had been returning, indeed, since the second day and a month later all were back, without wages increases.

The New York harbour strike of Jan. 1919 arose spontaneously as the result of local initiative and comprised practically all the 16,000 or 17,000 men employed on harbour craft. As a result 50,000 longshoremen also were idle. The harbour had been the scene of industrial dispute since 1917. The immediate cause of the 1919 strike was the refusal of the employers to appear for arbitration before the War Labor Board to which the men had appealed for the 8-hour day and increased pay. The employers were persuaded by President Wilson to accept arbitration, and the men returned to work. The award did not provide for the 8-hour day, and the men struck again. The Railroad Administration then made concessions to the men on boats, and they returned to work. Other Government employees followed, and by April the private employers settled for the original 10-hour day but with wages increases. On Oct. 7 the railway men struck again. The longshoremen joined them, against the orders of their national officials. They wanted increased pay; the strike dwindled away and was over by November.

STRINDBERG—STRYPA-CZERNOWITZ, BATTLE OF 397

In Aug. 1919, although forbidden by their national officers, the railway shopmen called a strike because of the delay of the Wage Adjustment Board to reach a decision on the demands of the men for increased pay. The strike began in Chicago and spread to New York and Boston; 250,000 men went out. After six days the strike was called off and the men returned to work. At the request of President Wilson the demands for wages increases were postponed. Other strikes not authorized by national officers of the union were those of employees of the General Electric Company in four cities in 1918 and of the New York local of the International Typographical Union in 1919. For 1917, 72 "unauthorized strikes" were reported, 58 for 1918, and 125 for 1919. Those in 1919 involved 1,053,256 strikers.

In Nov. 1919 435,000 bituminous coal-miners struck for wages increases of 60%. They also demanded the 6-hour day, and the 5-day week in order to distribute the work through the year. The miners at first refused to arbitrate the dispute as they feared the delay would give advantage to the employers. An injunction was issued to prevent the use of union funds for strike benefits. An award of an impartial committee was accepted in March 1920, which granted an average of 27% increase in wages, but the 8-hour day was retained.

About 93% of the policemen of Boston struck in Sept. 1919 for the right to organize and affiliate with the American Federation of Labor. The city was subject to rioting and crime until the National Guard restored order. President Wilson declared a police strike to be a crime against civilization. The police commissioner filled the places of the strikers with other men. In Aug. 1919 there was also an actors' strike, in which the stage hands and musicians joined in sympathy. An "outlaw" strike on the railways in April 1920, due to the delay of the President in appointing the Labor Board provided by the Transportation Act, was opposed by the brotherhoods. In 1919 and 1920 there were strikes on the Brooklyn Rapid Transit road, and in 1919 also on the Interborough Rapid Transit of New York.

A strike and lock-out in the men's clothing industry in New York of six months' duration was settled June 7 1921. The settlement may be regarded as a victory for the union, and for the principle of trade agreements. Since Sept. 1920 negotiations had been carried on between the employers' association and the union. Business depression gave an advantage to the employers, for whom a lock-out would not mean such a loss as if it had come a year earlier. On Dec. 2 the employers presented an ultimatum to the union stating that unless piece work, a reduction in wages and the employer's full control of employment and discharge were accepted before Dec. 6 the manufacturers would put their own programme into effect, regardless of the decision of the impartial board. The union rejected the ultimatum. The reply of the employers was an announcement that the impartial machinery had ceased to function. Stoppages of work by employees and lay-offs and shut-downs by employers followed. By Dec. 13 the union instituted picketing. An offer of mediation by the state Industrial Commission was accepted by the union, but rejected by the manufacturers. The manufacturers' association resigned from the national federation. In Jan. 1921 one of the employers began suit for an injunction against picketing, \$500,000 damages, and dissolution of the union because of its alleged revolutionary character. The suit for dissolution was dismissed on March 20. By March 27, 425 shops had reopened under agreements with the union, so that 25,000 of the 60,000 clothing workers were again at work. On April 5 the union announced that \$1,000,000 had been raised toward their defense fund. Early in May certain of the employers resigned from the association, and the remainder reached an agreement with the union, by which the bargaining machinery with the impartial chairman was reinstated. The workers accepted a 15% cut in wages. The union brought suit for \$1,000,000 damages against the employers on the charge of attempted boycott of union members.

STRYPA-CZERNOWITZ, BATTLE OF.—The fighting in the area between the River Strypa and Czernowitz (the capital of the Bukovina) in the winter of 1915-6 comprised an important series of operations on the eastern front between Russia and the Central Powers.

In the middle of Nov. 1915 the fighting activity in the Russian theatre of war had died down (see **EASTERN EUROPEAN FRONT CAMPAIGNS**). Both for Austria-Hungary and for Germany the war against Russia became of secondary importance in proportion as the war of annihilation against Serbia progressed. The Central Powers had for the moment no offensive in view against Russia, who was exhausted after the heavy fighting which had gone before. Both belligerents now settled down to a war of position, which enabled them to restore their armies. This lasted until Christmas.

In the middle of Dec., Ivanov, who was in command of the Russian S.W. front, prepared for a new great offensive. This was, no doubt, with the view of raising their fallen prestige and regaining the confidence of the wavering Balkan States; above all to relieve Montenegro, whose overthrow by Austria-Hungary was imminent; and not least to serving the advantage which a Russian victory would have in influencing Rumania, which was still vacillating, to join in against the Central Powers.

Three Russian armies—the VIII. under Brusilov, the XI. under Shtcherbachev and the IX. under Lechitski, with 32 infantry and 13 cavalry divisions as well as some *Reichswehr* formations—attacked the Austro-German front S. of the Polesie in E. Galicia and in the Bukovina. From N. to S there stood opposed to the Russians the main body of Linsingen's group of armies, Bohm's group of armies and Bothmer's and Pflanzer-Baltin's armies, counting roughly 40 infantry and 13 cavalry divisions. The approximate strength expressed in rifles was in the proportion of 450,000 Austro-Hungarian to 480,000 Russian. The Austro-Hungarian infantry divisions were on a lower establishment than the Russian.

Whereas on the N. wing and in the centre no particular actions took place, the main attack, assigned by Ivanov to Lechitski's and Shtcherbachev's armies, was delivered against Pflanzer and Bothmer on a front stretching from the Rumanian frontier to Burkanów on the Strypa. The main burden of the attack fell on Pflanzer-Baltin's army, which was fighting with 8 infantry and 5 cavalry divisions against the Russians' 10 infantry and 6 cavalry divisions.

Not without reason had the Russians selected the S. wing as the point of attack. A success which should give them back the capital of Bukovina could not have failed in its effect on Rumania. And besides, an advance into Bukovina was the shortest cut to the Carpathians, the reacquisition of which was among their most cherished ambitions. They hoped, by defeating Pflanzer's army, to roll up Bothmer's and Böhm's fronts.

The preparations for the attack on the Bessarabian front had been evident since the middle of December. Lechitski had during that month assembled 4 corps in front of Pflanzer's S. wing between the Pruth and the Dniester. A sharp watch was kept on this section by the XI. Corps under von Korda, general of infantry, with 3 infantry divisions and 1 of cavalry. Pflanzer was prudently preparing for the anticipated attacks by organizing the positions so strongly as to compensate for the deficiency in numbers. Reinforcements did not arrive until later.

On Dec. 23 an attack on Papp's brigade was repulsed with heavy Russian losses. In the following days small enemy attacks multiplied themselves at numerous points of the front. On the 26th heavy artillery fire began, and on the morning of the 27th, heralded by a heavy bombardment from at least 200 guns, the Russian mass attack was launched on the Bessarabian frontier.

and to the N.E. of Zaleszczyki, having as its centre of gravity the positions N. of Toporowce. In the afternoon also the Russians flung themselves six times on the Austro-Hungarian positions, 15 or 16 rows deep, but in vain. They were driven back with heavy losses either by artillery fire or in hand-to-hand fighting.

On the 28th they repeated their ruthless attacks, which, as at Toporowce and Bojan, became exceedingly violent. The S. wing of the S. army was attacked on the same day by the Russian XI Army, now commanded by Gen. Sakharov in place of Shtcherbachev. At Burkanów an Austro-Hungarian outpost on the Mogila height had to be brought back to the main position. On the 29th the battle reached its height. Not only the XI. Corps but also the VI. Corps and the 36th Inf. Div., defending the heights on the E. bank of the Strypa, were furiously attacked.

The Russians had brought up fresh forces from Odessa and Kherson for the attack on the N. wing of Pflanze's army. The Russian VII Army, with 5 to 6 divisions of the Caucasian V. Corps and the II Army Corps, pushed in between Lechitski's and Sakharov's armies, and in addition the II. Cav. Corps came over from Lechitski's S. wing. Considerably reinforced by these new forces, Ivanov continued to bring fresh masses into the attack on the Austro-Hungarian VI Corps and the 36th Inf. Div. But as on the previous days all these attacks, courageous as they were, broke down. Sakharov's S. wing met with the same fate in attacking the Burkanów bridge-head. Here the 132nd Inf. Bde. of Hoffmann's Corps heroically repulsed one onslaught after another and brought 900 prisoners behind the lines, leaving as many Russian corpses in front of the obstacles.

On the 30th and 31st the Russians, after hours of preliminary bombardment, renewed their attempts to break through opposite the VI. Corps. But Arz, reinforced by the 38th Honved Inf. Div. which had been brought up from the S. army, repulsed all the assaults. On the 31st the Russians, having had no success, and considerably weakened by their enormous losses, withdrew in the evening. On the Dniester front and the Bessarabian frontier they confined themselves on both days to moderate artillery fire, being greatly exhausted by the preceding days. On the II., I. and IV. Army fronts also, only artillery duels took place.

On New Year's eve and the morning of Jan. 1 1916 the attacks on Pflanze's S. wing in Bessarabia increased in intensity. But Korda repulsed all the Russian IX. Corps attacks in hand-to-hand fighting, with the help of the 9th Inf. Bde., which had come up from the Italian theatre. In the afternoon 6 Russian infantry regiments returned to the assault at Rarancze, and succeeded in forcing back the Austro-Hungarian position by about 300 paces on a breadth of 1,200 paces. A counter-attack was at once put in hand, but could not penetrate owing to renewed Russian attacks. Arz's and Bothmer's S. wing, which was attacked by the Russian XXII. Corps at Sokolov, repulsed all attacks on New Year's day.

On the 2nd the Russians repeated their efforts to break through at Rarancze, but failed in each case. But in view of the Russians' superior numbers, the Austro-Hungarian higher command renounced the idea of winning back the lost position.

On the 3rd and 4th the battle burst forth again on the Dniester front. At Toporowce and Rarancze furious fighting again took place. But the Russians' efforts remained fruitless, their attacks being frustrated by the striking bravery of the defenders in close fighting. Here the brave Croats of the 16th Inf. Reg. played a most glorious part. At Ocna, too, and at the bridge-head of Michalcze, N.W. of Uscieczko, the front and flanks of which were already surrounded by the Russians, all attacks were untiringly repulsed. On the 5th, after these assaults, a short lull set in once more in E. Galicia and on the Bessarabian frontier.

On Jan. 7, the Russian Christmas Day, which was also the opening day of the attack on Montenegro, the Russian storm-masses again attacked the VII. Army. At Dobropole a counter-attack by the 12th Inf. Div. drove the troops of the 3rd Turkestan Div. out of a captured line of trenches. At 11 A.M. the Russians opened a heavy bombardment on the Korda's XI. Corps, following it up at once with an infantry attack on the Toporowce and Burkanów positions. But this again brought no success.

On the 8th, 9th and 10th, it seemed as if the Russians had again to pause and take breath. Austro-Hungarian airmen reported the approach of new Russian reinforcements opposite the N. wing of Pflanze's army. On all these three days, however, the Russians continued to fire on the positions. On the 10th the firing at Toporowce and Rarancze became considerably more vigorous, and when it reached its greatest intensity on the 11th, and finally resolved itself into a bombardment, Korda again prepared for a most determined resistance. From three o'clock in the afternoon until ten in the evening, the Russian masses stormed the Austro-Hungarian positions unceasingly in the attempt to break through. But each new attack ended in a precipitate retreat, thanks to the excellent artillery defence.

Pflanze's front had meanwhile been reinforced by the 40th Honved Inf. Div., the 2nd Cav. Div. and the 24th Inf. Division.

It was not until the 13th that the Russians girded themselves for a fresh attack. With their divisions filled by fresh troops, they launched against Korda's positions eight violent assaults before the evening of the 14th, but were obliged to retire each time with heavy losses. This was their last effort. Their strength seemed broken, and on the 15th, except for some firing on the positions, there was peace.

The failure of the Russian attacks, and the cessation of hostilities against Montenegro which followed on the 17th, indicated the close of the New Year's battle. There were still a few isolated attacks in the next few days, but the need for rest on both sides brought about a speedy return to the war of positions. The embittered attacks of the Russian S. army persisted with only a few intervals for 24 days, ending in a complete victory for Austria-Hungary along the 130-km. battle-front of the VII. Army. At Rarancze only was a small portion of the front given up, whereas the Russian masses paid heavy tribute before the strong Austrian positions.

Thus the Russians failed to achieve their great aims. Their offensive was not able to save Montenegro from her fate, the Austro-Hungarian front had not been forced back, and the failure of the attack, which cost the Russians at least 170,000 dead and wounded and 6,000 prisoners, could not definitely influence Rumania's policy. (E. J.)

STUART, JAMES (1843-1913), British educationist and politician, founder of the university extension movement, was born at Balgonie, Fife, Jan. 2 1843, the son of Joseph Gordon Stuart, a manufacturer. He was educated at St. Andrews and at Trinity College, Cambridge, where he was third wrangler in 1866. In 1867 he was elected a fellow of Trinity, and became a mathematical tutor. The same year he lectured in astronomy to women teachers at Liverpool, and such was the success of these lectures that he was invited to repeat them at other centres. From this small beginning arose the university extension movement, which, though undertaken at first merely as an experiment, has now attained a very great success. In 1875 Stuart became first professor of mechanism and applied mechanics at Cambridge, and in this capacity was responsible for the organization of the university workshops and the teaching of engineering generally. In 1882 he unsuccessfully contested Cambridge University as a Liberal, but in 1884 was elected for Hackney. He held this seat till 1885. From 1885 to 1900 he was member for Hoxton and from 1906 to 1910 member for Sunderland. He was created a privy councillor in 1909. For many years he was a Progressive member of the London County Council, and was also interested in the management of the *Star* and the *Morning Leader*. Stuart married in 1890 Laura Elizabeth, the daughter of J. J. Colman, head of the great firm of mustard manufacturers, and became a director of the firm in 1898. He died at Norwich Oct. 13 1913.

STUART, RUTH MCENERY (1856-1917), American writer, was born in Avoyelles parish, La., in 1856. She was educated in private schools in New Orleans and in 1879 married Alfred C. Stuart, a planter. Her first story, *Uncle Mingo's Speculations*, appeared in 1888 in the *Princeton Review*. She moved to New York City in 1891 and soon became known for her stories of negro life in the South. She also wrote much verse for magazines.

She often appeared as a public reader of her own works, which were characterized by humour and pathos. Tulane University, New Orleans, conferred upon her in 1915 the degree of Litt.D. She died in New York City May 6 1917.

Her numerous books include *Carlotta's Intended* (1894); *Sonny* (1896); *In Simphinsville* (1897); *Moriah's Mourning* (1898); *Napoleon Jackson, the Gentleman of the Plush Rocker* (1902); *The Second Wowing of Salma Sue* (1905); *Sonny's Father* (1910); *The Unlived Life of Little Mary Ellen* (1910); *Daddy Do-Funny's Wisdom Jingles* (1913); and *Plantation Songs and Other Verse* (1916).

STUBBS, CHARLES WILLIAM (1843-1912), English divine, was born at Liverpool Sept. 3 1843, and educated at the Royal Institution school, Liverpool, and Sidney Sussex College, Cambridge. His father and grandfather were Yorkshire agriculturists, and throughout his life he took a strong interest in the welfare of the agricultural labourer, publishing three volumes on the subject, *Village Politics* (1878), *Christ and Democracy* (1883) and *The Land and the Labourers* (1890). He was a strong Liberal with somewhat socialistic views, and was preferred by Mr. Gladstone to the living of Stokenham and Chivelstone in Devon in 1884. In 1887 he was transferred to Liverpool, becoming rector of Wavertree. In 1893 he became dean of Ely, remaining there till 1905, when Sir Henry Campbell-Bannerman nominated him to the bishopric of Truro. He was Hulsean lecturer at Cambridge in 1904, and published his lectures under the title *The Christ in English Poetry* (1905). His other works include *A Creed for Christian Socialists* (1896); *Charles Kingsley and the Christian Social Movement* (1898) and a *Handbook to Ely Cathedral* (1898). He died at Truro May 4 1912.

STURDEE, SIR FREDERICK CHARLES DOVETON, 1ST BART. (1850-), British Admiral, was born at Charlton, Kent, June 9 1859, the son of a naval officer, and entered the navy in 1871. He was promoted lieutenant (1880), commander (1893), captain (1899), rear-admiral (1908), vice-admiral (1913), admiral (1917) and admiral of the fleet (1921). He saw service in Egypt (1882) and in Samoa (1898-9) when he was in command of the Anglo-American force. He was assistant-director of Naval Intelligence to the Admiralty (1900-2) and chief of staff, Mediterranean Fleet (1905-7) and Channel Fleet (1907). In 1910 he became rear-admiral of the first Battle Squadron, and commanded the 2nd Cruiser Squadron (1912-3). During the World War he was commander-in-chief, on the "Invincible," of the squadron which won the battle of the Falkland Is., Dec. 8 1914, and he took part in the battle of Jutland. He was created K.C.B. (1913), and K.C.M.G. (1916), and a baronetcy was conferred on him in 1916, with the title "of the Falkland Is." In 1918 he became commander-in-chief of the Nore.

STURDZA, DEMETRIUS (1833-1914), Rumanian statesman (see 25.1051), died in 1914.

STÜRGGH, CARL, COUNT (1850-1916), Austrian prime minister from Nov. 3 1911 to the time of his murder, was born on Oct. 30 1859, of an ancient noble Styrian family, and in 1881 he became an official of the Statthalterei at Graz, and later of the Ministry of Education. He left the State service in 1891, when he was elected as a representative of the loyal land-holding interest to the Reichsrat. He attached himself to the Left of the German party, and came forward as a keen opponent of universal suffrage. He was from Feb. 10 1909 to Nov. 3 1911 Minister of Education, and a zealous advocate of the humanistic education traditional in the gymnasia. Stürgkh was one of the committee of five ministers who decided on the dispatch of the ultimatum to Serbia and the declaration of war, which brought on the World War. He was killed on Oct. 21 1916 by a shot fired by the Social Democrat Friedrich Adler, a son of the Social Democrat leader, Viktor Adler, as a protest against Stürgkh's government without parliament. (See AUSTRIAN EMPIRE.)

STÜRNER, BORIS VLADIMIROVICH (1849-1917), Russian politician, was born in 1849, the son of an emigrant—his father being captain of a fire brigade at Tula. He studied at the university of Petrograd, and there made friends with Count Bobrinsky, a member of one of the leading Russian families, who introduced him into the upper circle of Petrograd society. His affable manners and his ability to win the confidence of important people

are the only explanation of his brilliant success in a circle to which he did not belong by birth or fortune. He started his career in the Chamberlain's department of the Imperial Court, but he held at the same time different situations in the Senate, the Ministry of Justice and elsewhere. When in 1892 the Government rejected the candidate nominated to the presidency of the executive board of the Tver Zemstvo, Stürmer, whose name was on the list of the Tver gentry, was appointed to this office. It was the first case of a president of the Zemstvo being appointed instead of being elected. In 1894 Stürmer was appointed governor of the Novgorod, and later of the Iaroslavl province. Subsequently he was in charge of a department of the Home Office. In 1904 he was created member of the State Council, but he never took an active part in the legislative work. Meanwhile he won the confidence of the Court, and he was made prime minister in Jan. 1916, at a period when the Emperor, avoiding strong personalities, wished to secure the fulfilment of his orders by devoted servants. As prime minister Stürmer's reactionary attitude provoked a strong opposition in liberal and patriotic circles, rumours accusing him of connexions with Germany were widely spread without real proof. These accusations were finally brought to the tribune of the Duma by M. Milyukov and resulted in Stürmer's resignation in November. After Sazonov's dismissal Stürmer took the portfolio of Foreign Affairs, and his activities in this department resulted in the premature declaration of war by Rumania, so disastrous for that country and for Russia. He was arrested after the revolution, and he died in prison of disease in Sept. 1917.

STYRIA (see 25.1058), an Austrian territory bordered on the E. by the Southern Slav State and that part of Burgenland which belongs to Austria; on the N. by Lower and Upper Austria, on the W. by Salzburg and Carinthia, and on the S. by the Southern Slav State. The part of Styria included in the Southern Slav State has an area of some 2,366 sq. m. and had, in 1910, a pop. of 433,000. The Austrian territory extends over some 6,304 sq. m., of which the greater part is mountainous and almost the whole lies in the Eastern Alps. Styria had formerly three large divisions:—Northern or Upper Styria; Middle Styria; and Southern or Lower Styria. Lower Styria and the southern part of Middle Styria, up to the Posruck range and to the Mur have, however, been taken over by the Southern Slav State. Middle Styria is surrounded on the W. and N. by a semi-circular mountain range which joins the Cetic and a part of the Noric Alps and has recently become known as the "Steierische Randgebirge." The pass through which flows the river Mur between Bruck and Graz unites it to Upper Styria. The northern part of Upper Styria is occupied by the heights of the *Nördlichen Kalkalpen*. The eastern part of the Noric Alps, the Bacher together with the Posruck, now belongs to the Southern Slav State.

Population.—The pop. of the Styria of to-day was, in 1910, 952,590; in 1920 it had decreased to about 946,720 (151 per sq.m.). It is almost purely German. The proportion of males to females in 1910 was as 1,000 to 983; in 1920 as 1,000 to 1,053. While Styria lost some 75,000 Germans, among whom were 9,000 belonging to the exclusively German-speaking districts, she has now only about 5,000 Slovene inhabitants. In 1910 the pop. of the present-day Styria was as to 97.4% Roman Catholic and 2.1% Evangelical.

For administrative purposes, Styria is divided into 16 districts and the autonomous city of Graz, the capital (pop. 137,032 in 1920). Other important places are:—(pop. figures are taken from the census of 1920) in the Traun and Enns district of Upper Styria—Bad Aussee (pop. 1,370); Elsenzerz (pop. 6,337); Mariazell, the famous resort of pilgrims (pop. 1,881); in the Upper Mur district—Judenburg (pop. 5,668); Fohnsdorf (pop. 7,199); Zeltweg (pop. 3,682); Knittelfeld (pop. 10,672); Leoben (pop. 11,231); Donawitz (pop. 15,087); Vordernberg (pop. 2,352); Bruck an der Mur (pop. 8,490);—in Mürz-Thal—Kappenberg (pop. 12,576); Mürzschlag (pop. 6,483);—in Middle Styria—Köflach (pop. 2,655); Voitsberg (pop. 3,283); Eggenberg bei Graz (pop. 15,554); Weiz (pop. 3,620); Fürstenfeld (pop. 5,649) and the Gleichenberg Spa, Kurort Gleichenberg (pop. 872).

Education.—Styria has three higher educational establishments, namely the university and the technical college of Graz and the Montanist College in Leoben.

Notwithstanding the great newness of the surface, only 8.0% of the present Styria could be reckoned as unproductive in 1900. Of the productive parts, 19.1% was arable, 0.9% gardens; 0.5%

vineyards, 11.8% meadows; 13.3% grazing lands, 54.4% was, however, forest. This territory is justly called "green Styria." Cattle-raising has greatly developed and farming is actively carried on on the high lands. Nevertheless, in 1918 there were only 358,108 head of cattle (of which 170,630 were milch-cows) and 344,188 swine. A good breed of horses exists in Ennstal and considerable attention is devoted to poultry-farming in Middle Styria, where the shooting and fishing are good. The forests yield a great variety of timber.

Minerals.—Styria is so rich in iron ore that it has been called the "land of iron" (*eiserne Mark*). Lignite is also abundant. Of the total output of the mines of present-day Austria (51,000,000 kronen in 1915) 71% (36,000,000 kronen) is attributed to Styria; its output of iron (1.8 million tons in 1915) is over 94% of the Austrian total. Iron-mining is almost exclusively confined to the Erzberg between Eisenerz and Vordernberg. The manufacture of iron in Austria is now almost entirely confined to Styria (538,753 tons out of a total of 541,004 tons). The most important iron-smelting works are in or near the above-named region and at Iliefau, Trofaiach and especially Donawitz; in the lignite districts, in Zeltweg and Knittelfeld, near the lignite diggings of Fohnsdorf and in Eibiswald; also in Murz-Thal (Kapfenberg, Mürzzuschlag). The Mürz-Thal is also the centre of the newly created scythe-making industry.

The lignite produced, 1.8 million tons or over 74% of the Austrian total, is found in many places. The most important mines are at Fohnsdorf in Upper Styria; the product of those near Leoben is used by the great metal works of Donawitz and others—and there are smaller mines in Mürz-Thal; in Western Middle Styria in the districts of Hofbach and Voitsberg and those of Eibiswald and Wies.

Styria also produces salt; 28,000 tons, some 17% of the whole Austrian output, was obtained near Aussee in 1915. It yields also almost the entire Austrian output of graphite and some sulphur, lead and zinc ores, clay and building stone. The output of magnesite has become especially important; Styria alone almost supplies the world, chiefly from the neighbourhood of Veitsch, Trieben, Kraubath, in the Breitenau near Bruck and elsewhere.

Water-power.—The plentiful and accessible supply of water-power has caused the installation of great electrical stations of which, however, full advantage has not been taken. The electrical works of Weiz are world-famed.

Manufactures.—Notable Styrian manufacturing industries are those of the iron works at the places already named, also at Pailen-Thal (Rottenmann, Trieben) and at and near Graz. These turn out a great variety of iron goods, small articles as well as scythes, machinery, locomotives (Graz), bicycles (Graz) and wagons. Graz makes carriages and automobiles and also holds an important place in the wide-spread wood industries (including furniture). The manufactures of lignite and cellulose, pasteboard, paper (Graf-Korn, near Graz, and other places), also of beer (Graz), tiles, flour, leather, explosives (Deutsch-Landsberg and other places) are considerable. Less important are flour-milling, and the textile, glass, tobacco and chemical industries.

Communications.—The new frontier cuts through the Marburg-Unterdrauburg line so that the connexion between Middle Styria and Carinthia goes a long way round, causing considerable inconvenience. Mariazell is now connected by rail with Vienna.

SUBMARINE CABLE TELEGRAPHY (*see 26.527*).—In 1921 there were over 298,000 nautical miles of telegraph cable in operation at the sea bottom, made up of some 3,000 separate lengths, of which about 2,540 were administered by the various governments concerned, whilst the remainder were the property of private (mainly British) companies. Of the world's cables, over 130,000 n.m. are owned by British companies, 71,000 by American companies, and 24,000 by companies of other countries. How much the Allied countries—especially Britain—were indebted to submarine telegraphy in connexion with the World War will probably never be fully realized. Had British communication with the Dominions been cut off at the outset by the enemy, months would have elapsed before arrangements could have been completed for the despatch of the overseas contingents which rushed to British aid. On the other hand, within four hours of the declaration of war, Germany was entirely deprived of direct telegraphic communication with the United States. A British cruiser effected the required interruption in the English Channel by cutting both the cables running between Emden and New York via the Azores, one being taken in to Penzance (Cornwall). Then in March 1917 they were both cut at points 643 and 610 n.m. respectively from New York, one of them being diverted by a British P.O. telegraph ship into Halifax, Nova Scotia. Since July 1917 this has been at any rate temporarily turned to account as a connecting link with the All-British Pacific Cable system. The other line was handed over to France and taken in to

Brest.¹ Altogether 20,000 n.m. of ex-German cables were captured during the war, covering practically every one of those passing through the English Channel.

Remarkable indeed were the achievements of submarine telegraph cable-laying and repairing authorities during the war. Despite the active German submarine warfare, a vast number stand to the credit of British ships, largely to meet immediate strategic requirements. Whilst some of these were effected by cruisers of the Royal Navy provided with the necessary apparatus and the required length of cable, they were in the most part carried out by specially designed telegraph ships, though accompanied as often as possible (where especially desirable) by a man-of-war as escort. In addition to manufacturing 20,000 m. of trench telephone cable, the Telegraph Construction and Maintenance Co. made 19,000 m. of submarine cable, and its ships were actively engaged on highly dangerous work in the way of laying, repairing and diverting cables. The "Telconia"—perhaps the most efficiently designed telegraph ship in existence—made 75 cable repairs and laid 24 new lines around the English and Irish coasts whilst in commission for H.M. Post Office.

The first entirely new cable to be laid during the war was that by the Telegraph Construction Co.'s T.S. "Colonia" between Montevideo and the Falkland Is. in 1915, under the auspices of the British Admiralty. In the same year, this company also laid, under Post Office supervision, a direct Anglo-Russian cable from Peterhead (Aberdeenshire) to Alexandrovsk (about the nearest Arctic Ocean coast point to Petrograd). In both instances this was the earliest occasion on which a cable had been brought to the farther point. The first line had purely strategic objects in view, but the second was more especially to meet the fact that communication between Britain and Russia had previously been only effected across countries that were now to a great extent enemy countries; indeed, the Indo-European Telegraph Co.'s land line system had become practically inoperative ever since the outbreak of the war. This work was a truly remarkable feat. The cable was laid in the winter and was landed on Russian territory at the time of year when the sun does not rise above the horizon in those northern latitudes. In fact, the entire undertaking had to be carried out in darkness, as well as in seas infested with enemy submarines. It was conducted with every possible secrecy, it being arranged for the "Colonia," in order to mislead the enemy, to go on a preliminary cruise in an entirely different direction. With land lines at each end and special repeaters, direct telegraphic communication was thus established between the Central Telegraph Office in London and the corresponding building in Petrograd. Moreover, many telegrams from countries S. of Russia—Greece, for instance—passed over this cable in making their circuitous journey from the Levant to various quarters of the globe. This was the first piece of ocean cable work that the British Post Office had ever had to do with. Thus, for its purpose, Post Office engineers and clerks were initiated, at short notice, in the art of deep-sea cable-laying and long distance cable-working at the hands of the contractors, as well as by a staff of the Eastern Telegraph Co. provided for working the cable.²

The other more especially important piece of British cable work was the putting through of one of the Emden-New York cables as the first Imperial Atlantic cable to link up with the All-British Pacific line. The path taken by what now constitutes a completed "All Red" route to Australasia is London, Penzance, Fayal Isle, Azores (mid-Atlantic), Halifax, Bamfield (Vancouver), Fanning I. (a small, mid-Pacific, coral formation), Suva (Fiji Is.), Norfolk I., from whence there are two branches, one to Southport, Queensland (Australia) and the other to Auckland (New Zealand).

The Atlantic section of this "All Red" cable system was being worked in 1921 by the Post Office. Thus it has come to pass that a Government department, that, conjointly with the great cable companies, had opposed in turn the scheme for an All-British

¹ Owing to the enemy's submarine activities, the late German Atlantic cables could not be attended to for some 14 months.

² The Post Office Engineering Department's previous experience of cable work was closely confined to short Channel lines, etc.

She often appeared as a public reader of her own works, which were characterized by humour and pathos. Tulane University, New Orleans, conferred upon her in 1915 the degree of Litt.D. She died in New York City May 6 1917.

Her numerous books include *Carlotta's Intended* (1894); *Sonny* (1896); *In Simphinsville* (1897); *Moriah's Mourning* (1898); *Napoleon Jackson, the Gentleman of the Plush Rocker* (1902); *The Second Wowing of Salma Sue* (1905); *Sonny's Father* (1910); *The Unlived Life of Little Mary Ellen* (1910); *Daddy Do-Funny's Wisdom Jingles* (1913); and *Plantation Songs and Other Verse* (1916).

STUBBS, CHARLES WILLIAM (1843-1912), English divine, was born at Liverpool Sept. 3 1843, and educated at the Royal Institution school, Liverpool, and Sidney Sussex College, Cambridge. His father and grandfather were Yorkshire agriculturists, and throughout his life he took a strong interest in the welfare of the agricultural labourer, publishing three volumes on the subject, *Village Politics* (1878), *Christ and Democracy* (1883) and *The Land and the Labourers* (1890). He was a strong Liberal with somewhat socialistic views, and was preferred by Mr. Gladstone to the living of Stokenham and Chivelstone in Devon in 1884. In 1887 he was transferred to Liverpool, becoming rector of Wavertree. In 1893 he became dean of Ely, remaining there till 1905, when Sir Henry Campbell-Bannerman nominated him to the bishopric of Truro. He was Hulsean lecturer at Cambridge in 1904, and published his lectures under the title *The Christ in English Poetry* (1905). His other works include *A Creed for Christian Socialists* (1896); *Charles Kingsley and the Christian Social Movement* (1898) and a *Handbook to Ely Cathedral* (1898). He died at Truro May 4 1912.

STURDEE, SIR FREDERICK CHARLES DOVETON, 1ST BART. (1850-), British Admiral, was born at Charlton, Kent, June 9 1859, the son of a naval officer, and entered the navy in 1871. He was promoted lieutenant (1880), commander (1893), captain (1899), rear-admiral (1908), vice-admiral (1913), admiral (1917) and admiral of the fleet (1921). He saw service in Egypt (1882) and in Samoa (1898-9) when he was in command of the Anglo-American force. He was assistant-director of Naval Intelligence to the Admiralty (1900-2) and chief of staff, Mediterranean Fleet (1905-7) and Channel Fleet (1907). In 1910 he became rear-admiral of the first Battle Squadron, and commanded the 2nd Cruiser Squadron (1912-3). During the World War he was commander-in-chief, on the "Invincible," of the squadron which won the battle of the Falkland Is., Dec. 8 1914, and he took part in the battle of Jutland. He was created K.C.B. (1913), and K.C.M.G. (1916), and a baronetcy was conferred on him in 1916, with the title "of the Falkland Is." In 1918 he became commander-in-chief of the Nore.

STURDZA, DEMETRIUS (1833-1914), Rumanian statesman (see 25.1051), died in 1914.

STÜRGGH, CARL, COUNT (1850-1916), Austrian prime minister from Nov. 3 1911 to the time of his murder, was born on Oct. 30 1859, of an ancient noble Styrian family, and in 1881 he became an official of the Statthalterei at Graz, and later of the Ministry of Education. He left the State service in 1891, when he was elected as a representative of the loyal land-holding interest to the Reichsrat. He attached himself to the Left of the German party, and came forward as a keen opponent of universal suffrage. He was from Feb. 10 1909 to Nov. 3 1911 Minister of Education, and a zealous advocate of the humanistic education traditional in the gymnasia. Stürggkh was one of the committee of five ministers who decided on the dispatch of the ultimatum to Serbia and the declaration of war, which brought on the World War. He was killed on Oct. 21 1916 by a shot fired by the Social Democrat Friedrich Adler, a son of the Social Democrat leader, Viktor Adler, as a protest against Stürggkh's government without parliament. (See AUSTRIAN EMPIRE.)

STÜRNER, BORIS VLADIMIROVICH (1849-1917), Russian politician, was born in 1849, the son of an emigrant—his father being captain of a fire brigade at Tula. He studied at the university of Petrograd, and there made friends with Count Bobrinsky, a member of one of the leading Russian families, who introduced him into the upper circle of Petrograd society. His affable manners and his ability to win the confidence of important people

are the only explanation of his brilliant success in a circle to which he did not belong by birth or fortune. He started his career in the Chamberlain's department of the Imperial Court, but he held at the same time different situations in the Senate, the Ministry of Justice and elsewhere. When in 1892 the Government rejected the candidate nominated to the presidency of the executive board of the Tver Zemstvo, Stürmer, whose name was on the list of the Tver gentry, was appointed to this office. It was the first case of a president of the Zemstvo being appointed instead of being elected. In 1894 Stürmer was appointed governor of the Novgorod, and later of the Iaroslavl province. Subsequently he was in charge of a department of the Home Office. In 1904 he was created member of the State Council, but he never took an active part in the legislative work. Meanwhile he won the confidence of the Court, and he was made prime minister in Jan. 1916, at a period when the Emperor, avoiding strong personalities, wished to secure the fulfilment of his orders by devoted servants. As prime minister Stürmer's reactionary attitude provoked a strong opposition in liberal and patriotic circles, rumours accusing him of connexions with Germany were widely spread without real proof. These accusations were finally brought to the tribune of the Duma by M. Milyukov and resulted in Stürmer's resignation in November. After Sazonov's dismissal Stürmer took the portfolio of Foreign Affairs, and his activities in this department resulted in the premature declaration of war by Rumania, so disastrous for that country and for Russia. He was arrested after the revolution, and he died in prison of disease in Sept. 1917.

STYRIA (see 25.1058), an Austrian territory bordered on the E. by the Southern Slav State and that part of Burgenland which belongs to Austria; on the N. by Lower and Upper Austria, on the W. by Salzburg and Carinthia, and on the S. by the Southern Slav State. The part of Styria included in the Southern Slav State has an area of some 2,366 sq. m. and had, in 1910, a pop. of 433,000. The Austrian territory extends over some 6,304 sq. m., of which the greater part is mountainous and almost the whole lies in the Eastern Alps. Styria had formerly three large divisions:—Northern or Upper Styria; Middle Styria; and Southern or Lower Styria. Lower Styria and the southern part of Middle Styria, up to the Posruck range and to the Mur have, however, been taken over by the Southern Slav State. Middle Styria is surrounded on the W. and N. by a semi-circular mountain range which joins the Cetic and a part of the Noric Alps and has recently become known as the "Steierische Randgebirge." The pass through which flows the river Mur between Bruck and Graz unites it to Upper Styria. The northern part of Upper Styria is occupied by the heights of the *Nördlichen Kalkalpen*. The eastern part of the Noric Alps, the Bacher together with the Posruck, now belongs to the Southern Slav State.

Population.—The pop. of the Styria of to-day was, in 1910, 952,590; in 1920 it had decreased to about 946,720 (151 per sq.m.). It is almost purely German. The proportion of males to females in 1910 was as 1,000 to 983; in 1920 as 1,000 to 1,053. While Styria lost some 75,000 Germans, among whom were 9,000 belonging to the exclusively German-speaking districts, she has now only about 5,000 Slovene inhabitants. In 1910 the pop. of the present-day Styria was as to 97.4% Roman Catholic and 2.1% Evangelical.

For administrative purposes, Styria is divided into 16 districts and the autonomous city of Graz, the capital (pop. 137,032 in 1920). Other important places are:—(pop. figures are taken from the census of 1920) in the Traun and Enns district of Upper Styria—Bad Aussee (pop. 1,370); Elsenzerz (pop. 6,337); Mariazell, the famous resort of pilgrims (pop. 1,881); in the Upper Mur district—Judenburg (pop. 5,668); Fohnsdorf (pop. 7,199); Zeltweg (pop. 3,682); Knittelfeld (pop. 10,672); Leoben (pop. 11,231); Donawitz (pop. 15,087); Vordernberg (pop. 2,352); Bruck an der Mur (pop. 8,490);—in Mürz-Thal—Kappenberg (pop. 12,576); Mürzschlag (pop. 6,483);—in Middle Styria—Köflach (pop. 2,655); Voitsberg (pop. 3,283); Eggenberg bei Graz (pop. 15,554); Weiz (pop. 3,620); Fürstenfeld (pop. 5,649) and the Gleichenberg Spa, Kurort Gleichenberg (pop. 872).

Education.—Styria has three higher educational establishments, namely the university and the technical college of Graz and the Montanist College in Leoben.

Notwithstanding the great newness of the surface, only 8.0% of the present Styria could be reckoned as unproductive in 1900. Of the productive parts, 19.1% was arable, 0.9% gardens; 0.5%

words were sent. Ten years later, the volume of traffic had been increased ten-fold. The war brought this up to some 26,000 words per day, or about 9,500,000 words per annum. Notwithstanding the large capital cost of this line (£2,000,000) it produced a gross profit of £94,000 for the year 1920, whilst its reserve fund stood at nearly £1,107,000. To illustrate the high strategic value of the line, during the war, if the Allies had happened to be—even temporarily—deprived of naval control, the British Mediterranean cables would undoubtedly soon have been cut, which would have meant that British inter-imperial telegraphic communication could only have been secured by means of the All-British Pacific line. It had been felt for a long time that, since the Imperial Pacific cable was laid as far back as 1902, steps must be taken to duplicate it in order to provide against complete breakdown, as well as for dealing with over-congestion. In 1921, however, owing to the necessity for economy and to the high cost of materials, it seemed probable that this duplication would require to be limited, for the present, to the duplication of the long, slow working, section in very deep water, i.e. the 3,458 n.m. between Bamfield (Vancouver) and Fanning I., which runs into a depth of 3,400 fathoms (nearly 3½ n.m.), and brings down the resultant speed on the whole line to a low figure.

Perhaps nothing contributed more in the past to the leading commercial position of Britain than her enterprise in the matter of telegraph cables. Fortunately, too, she also recognized that the problem of Empire is largely a problem of communication. Arising out of the war to some extent, there has been a general demand for a great deal more inter-communication, not only between different branches of the British Empire, but also between distant foreign countries. This demand must be met in the first place by a considerable addition to the world's cable system over and above those that were in operation previous to hostilities. The part of the British Empire which in 1921 was more especially badly served in the matter of telegraphic communication was the West Indies, where, largely owing to the nature of the sea bottom, the existing inter-insular lines (originally laid in 1870) were constantly breaking down.¹ But for "atmospherics" in these tropical regions, this would be an ideal case for "wireless." As it is, it would seem that an efficient air service would do most to improve prevailing shortcomings—at any rate for mail purposes, the steamer service being also very deficient. From a world standpoint, however, probably the most acute need for additional cable facilities is in the Pacific Ocean, for, while the traffic over the N. Atlantic cables has been practically quadrupled since 1913, Pacific cable traffic has increased nearly nine-fold.

The war also aroused the United States to her disadvantage in the matter of cable communication as compared with her trade rivals. Thus, on April 26 1921, the U.S. Senate passed a bill "to prevent unauthorized cable landings in the United States or any of its possessions." The bill gives the President sweeping authority also to issue, withhold and revoke licences as to cable landings, as well as for obtaining concessions for the United States in other parts of the world. Section 2 of the bill enables the President "to withhold or revoke such licence when satisfied such action will assist in obtaining for the landing or operation of cables in foreign countries or in maintaining the rights or interests of the United States." The President may grant such licence on such terms as will assure just and reasonable rates. The licence is not to give the licensee exclusive rights of landing or of operation, in the United States. The policy appears to be based chiefly upon considerations that shall guard against consolidation or amalgamation with other cable lines, while insisting upon reciprocal accommodation for American corporations and companies in foreign territory. In 1920 the U.S. authorities refused to allow a cable laid for the Western Union Co. to be landed at a point on the coast of Florida on the ground that it was intended for connecting up, *via* Barbados, with the "Western Telegraph" system (at Maranham) of a British company.² The American Govern-

ment considered that allowing such a cable to be laid would have lent colour to the British company having sole rights of communication between the United States and Brazil. As a matter of fact, another American company (All America Cables, Inc., of New York)³ was also preparing to lay a cable to the Brazilian Coast, and it was thought by the U.S. Government that by acceding to the application of the Western Union Co., the claims to a monopoly being possibly established thereby might prevent the other cable being laid—a cable greatly to the interests of American trade with Brazil. The United States had evidently determined to establish its own system of cables throughout the world, partly for high national reasons, but also with a view to developing trade, especially with S. America.

France also has shown a disposition to be increasingly active and enterprising in this matter; likewise Japan.

International Cable Conference, 1920-1.—Probably no telegraphic conference has ever been the scene of such acute disagreement on essential points as that which held sittings during parts of 1920 and 1921 at Washington. This was perhaps natural, when we remember (a) that Germany had been relieved of practically all her cables, (b) that the destiny of these cables was of first-rate importance to all the principal powers.

Soon after the confiscation of the German cables an agreement was entered into between Great Britain, France, Italy and Japan, whereby these ex-German lines were to be severally distributed amongst them. The United States having come into the war some time later, it was proposed at the Conference, that these cables should, as a substituted arrangement, become the joint property of the five Allies.

The actual diversion of the German Atlantic cables was completed by Great Britain in July 1917, and by France in Nov. 1917—in both instances after the United States had joined the Allies. The American view was, therefore, that neither of these appropriations of cables between the Azores (Portuguese possessions) and the United States could be justified, seeing that both the United States and Portugal were already allied with England and France in the vigorous prosecution of the war. Then again, no single section of the ex-German cable in the Pacific touched Japanese soil, but one landed on American territory (Guam). Thus it was argued that it was something of an anomaly that the Japanese should ever have seized the German cable system, to the great detriment of American trade with China and the Philippines—and correspondingly to their own (Japanese) advantage.

There were probably few matters that could, in principle, be dealt with so suitably by the League of Nations as those associated with international telegraphic communication. But that could only apply if, and when, the United States joined the League, or, on the other hand, in instances where America was in no way concerned. With ex-German islands and cables, however, it was quite clear that the United States was very much concerned. Further, there was no nation whose interests were liable to be so much affected by the mandate as regards Yap—more especially in reference to the cable—as the United States. The control of telegraphic communication between that island and China meant much to Japan. On the other hand, such an arrangement was regarded as contrary to American interests. In these circumstances, seeing that the United States was one of the "principal Allied and Associated Powers," the question was raised why such a mandate was ever granted to Japan without the assent of the United States. However, the Yap difficulty was eventually settled, so as to preserve American rights, at the Washington Conference in Dec. 1921 (*see JAPAN*; also *WASHINGTON CONFERENCE*).

consideration of recent years both in Britain as well as in the United States. Thus, in order to improve the then existing facilities, a cable was laid in 1910 by the Telegraph Construction & Maintenance Co. between St. Vincent, Ascension and Buenos Aires, these sections now forming a part of the Western ~~Telegraph~~ Telegraph Co.'s system. In 1920, the same company laid a cable between Maranham and Barbados.

² The prospects of trade with S. America are, in fact, so attractive that telegraphic communication therewith has been made a special

It was perhaps in the nature of things that those countries—such as the United States—which were in a less favourable position in the matter of cable ownership should especially desire the internationalization or neutralization of cables. Certainly, the neutralization and internationalization of cable systems might have one advantage, *i.e.* bring to an end the suspicions, right or wrong, that messages concerning another country were delayed, scrutinized, tampered with, etc. Such charges were largely due to keen commercial rivalry, and principally—if not entirely—a question of news agencies rather than cable companies. Any foundation they had was probably more or less closely limited to the war, when certainly Canada was very ill-supplied with news from Europe—or indeed, with reference to Imperial matters—whilst over-abundantly informed of trouble in Ireland.

Strategic Cables—Unless the strict neutralization of cables becomes the order of the day, under the League of Nations or otherwise, the best principle would probably be that every country should—partly for strategical reasons—establish for itself many more cables on a variety of routes well clear of foreign soil. These should be worked on a low rate basis for the general encouragement of intercommunication, but especially for developing commerce and trade. They should be supplemented by wireless, which is already in use as feeders to the cable systems. There can be no question that messages passing through cables touching foreign territory are insecure. If the cable lands on an enemy's country, the message is stopped or read off, and if on neutral soil, it runs the chance of also finding its way to the enemy, if only because a country which is neutral to-day may be unfriendly to-morrow. A clear distinction must be observed between an international submarine cable and a national cable. An international cable is one which connects the territory of different independent states, a national submarine cable is one which unites the territory or the colonial possessions of a single independent state. The character of the charter or ownership of a submarine cable determines whether it should be deemed foreign or national in respect to a particular state. Apart from their great strategic value, the Chambers of Commerce of practically every important town in the United Kingdom have, on strictly business grounds, loudly urged for a system of All-British cables worked at comparatively easy rates. The same course has also been taken at various influential congresses of the Chambers of Commerce of the British Empire, partly with a view to ensuring against enemy interruptions and eavesdropping. Promoters of private enterprise are indisposed to undertake the laying of cables of a strategic, rather than commercial, order. On the other hand, the cables on the trade routes—through the Mediterranean, etc.—are especially liable to interruption, much more so than those in the open ocean.

Cable Tariff—The ordinary cable rates, though showing material reduction from those of the earliest days, were in 1921 still very high from the public standpoint.¹ For financial reasons, they were largely based on the length of cable involved (see accompanying table), whereas it is just in the case of especially great distances that the cablegram is at an advantage against the mail boat. Here is a striking case where public (*i.e.* national) and private interests necessarily clash, and where, of course, national interests should be made supreme. This, it is to be feared, can be done only by adequate state control.

In the final report (Cd. 8462) of the Dominions Royal Commission in 1917 expression was given to the view that "charges are very high, the scales extremely complicated and their justification difficult to recognize." The report goes on to say: "The popularization of the cable service can only come with a simplification of the charges and their radical reduction; at present outside its commercial use cable communication is a luxury."

In 1912 a system of half rates for plain-language cablegrams deferred in transmission for 24 hours was introduced after many years' outside pressure. This reform marks something of an epoch in the history of cable telegraphy, and has, in due course, become universal. Week-end cablegrams at a reduced rate were

also introduced a little later, this being further supplemented by reduced rates for press messages between Britain and her Dominions. There is also now the "cable letter" service which offers even more favourable rates.

With practically all the great cable companies, the tariffs were maintained throughout the war at the same normal figure, whilst considerably more business was done than under peace conditions. A great increase in Government messages occurred, and the suspension of private codes added vastly to the length of most business telegrams, not to mention the continuous flow of extensive press "cables" relating to the war. Then, again, an enormous number of messages were sent such as in normal times—free from postal shortcomings—would be limited to ordinary written correspondence or to "deferred" traffic, which was abandoned by most of the cable companies throughout hostilities. The net result was that these organizations, unlike railway companies, not only maintained their reserves, but very materially added to them during the war. The best explanation here is to be found in the fact that cable repairs to be faced after the long period of warfare were altogether abnormal, though it must be remembered most of the companies concerned already had enormous reserves. The principal exception is the case of the Central and South American Telegraph Co, combined with the Mexican

¹ Some of the more recent reductions may possibly be due in part to the competition—such as it is—of wireless telegraphy.

Telegraph Co. (the former operating what are now known as the All-America Cables), which, during the war, made large reductions in their tariff, even though, on the greater part of their route, holding a monopoly. The directors expressed their conviction that (a) the cable performs a very special mission during warfare, and (b) it plays a highly important part in the fostering of trade relations. They were, therefore, determined to aid in every way possible the efforts to maintain and extend the already large trade between the United States and the countries of Central and S. America.

It must not be forgotten that an essential accompaniment to a low telegraph tariff is many more communicating strings; otherwise, the congested condition only becomes worse congested. On the other hand, it is also only by great developments—of one sort and another—in our means of communication that an increased, as well as cheaper, telegraphic output can be secured.

Nationalization—One result of the Dominions Royal Commission's exhaustive inquiry was the following expression of opinion: "We feel bound, however, to record our opinion that at no distant date the nationalization of the private cable companies will become one of the most urgent problems for statesmanship." Their report states further—"It appears difficult, if not impossible, to attain the desired cheapness of cable communication, as to the importance of which we hold the strongest views, without interfering with the rights of private companies." Again—"The urgency of placing cable communication on such a footing that it would be available, not only to the rich, but to all classes, not only to the merchant, but also to the private individual, is manifest and imperative."

But it must not be forgotten that the world is indebted, in the first instance, to the enterprise of private companies for the establishment of submarine cable communication. Some of the companies have certainly been assisted in their enterprise by large Government subsidies.² Moreover, these companies have met with rich returns over their enterprise.

Telegraph Control Board—Whether State ownership should ever be adopted by a country is, of course, a large question, but it seems obvious that in national and imperial interests a measure of State control is desirable in the matter of inter-imperial communications generally. A controlling organization of one sort or another appears to be called for, if only for watching and securing public interests, where clashing with private interests, in return for favours granted by the State.

In the case of Great Britain there are no less than seven Government departments (in addition to the Treasury) concerned in this matter. Hitherto one of these alone (the Post Office) has been acting for the Government, and all questions regarding other departmental interests had to be submitted to the Post Office. This was never very satisfactory in the result.

A British inter-departmental board to deal with inter-departmental telegraphs of all sorts has been advocated for many years. By this scheme, all the Government departments concerned were to be represented and to meet periodically to discuss and settle all important matters as they arose. The war made it clear to the British Government that something of the sort was necessary; and Jan. 1 1919 saw the establishment of such a committee, the whole coming under the *aegis* of the Committee of Imperial De-

fence. Such a control board, or committee, becomes increasingly desirable in these days of wireless development, for a nice sense of impartiality and discrimination may be required for deciding what should be effected by cable and what by wireless.

Working Developments.—The development of the art of submarine telegraphy was considerable during 1907-21—not so much in relation to the cable itself as to the electrical apparatus for working it. These include the introduction of automatic relays (associated more especially with the names of the late Dr. Alexander Muirhead, F.R.S., and Mr. S. G. Brown, F.R.S.) on the Eastern, Western Union, All-British and Commercial-Pacific cables, as well as other wide-spread cable systems.

These have almost entirely superseded manual retransmission between cable sections. Secondly, the introduction of magnifiers (or amplifiers, as they are sometimes called), by rendering the signals more legible, has enabled the carrying capacity of the cables to be enormously increased, at the same time adding to their reliability in the matter of accuracy. Such devices are based on the published experiments of Charles Curtis in the United States and Edward Raymond-Barker in England, and emanate in turn from K. C. Cox, T. B. Dixon, Walter Judd, Angus Fraser, E. S. Heurtley and Axel Orling. The Heurtley magnifier has been very widely adopted by the Pacific Cable Board, the Eastern Association Companies, etc. In vastly improving the character of the signals, this type of apparatus achieves the net result of adding to the effective working speed in the same degree. Indeed, the later results with the Orling magnifier point to a speed increase of as much as 200 per cent.

Thirdly, automatic printing apparatus has been introduced on the land lines worked in conjunction with cables. This apparatus is for the most part due to Mr. F. G. Creed.

Then again, Maj.-Gen. G. O. Squier, Chief Signal Officer of the U.S. army, has experimented with alternating current generators for cable telegraphy, and his researches point to results of a highly advanced—as well as revolutionizing—character.

The Imperial Cable section of the "All Red" route is associated with some of the latest developments in cable telegraphy. The transmission both at London and Halifax is effected by what are known as converter cable transmitters. These are entirely automatic in their working, and, by the use of a switch, will take either Morse or cable type of perforation. There are automatic repeaters at each of the intermediate stations. One of these sections, *i.e.* Bamfield-Fanning, 3,458 n.m., is the longest existing cable length, and has always been a source of great difficulty in the matter of speed as well as from a commercial point of view generally. In the circumstances, the results that have been achieved, by means of recent electrical devices, are very remarkable. It is, indeed, highly creditable that the score of a cricket match can be got through from Melbourne to London within 15 minutes, despite the six intermediate retransmitting points, over so great a total length. A few years earlier, such retransmissions were always effected manually. Now, however, automatic (machine) repeaters are gradually becoming general for all extensive systems with a number of intervening cable sections. The average duplex working speed on the entire route (controlled by that of the long section) was formerly 78 words per minute,³ but it has been very considerably increased by means of the Heurtley amplifier or magnifier. Something like a 40% increase in the simplex working speed (or 20% duplex) is claimed on this apparatus, which converts the microscopic signals associated with a long cable worked at high speed into characters of reasonable size. On the Atlantic sections some of the very latest devices have been introduced for the purposes of efficient and high speed working, such as had previously been adopted by the Eastern Associated Telegraph Companies. In the main, the plan is that of Morse working in connexion with the Gulstad Relay, so that the speed of connecting land lines is brought up to that of cable code working.⁴ The Eastern Compa-

¹ Final Report (Cd. 8462 of 1917).

² These are as follows—

Name of Company	Amount of Subsidy	Period of Subsidy	Cables for which Subsidy granted
Eastern Telegraph Co.	£ 4,500	20 years from April 24 1901.	Sierra Leone-Ascension
Eastern & S. African Telegraph Co.	28,000	20 years from Nov. 1893.	Zanzibar-Seychelles-Mauritius.
	13,500	20 years from Jan. 1 1900.	Three S. African cables
Eastern Extension Co.	4,000	Indefinite.	Chefoo-Wei-hai-wei.
Direct West India Co.	8,000	20 years from Feb. 1 1898.	Bermuda-Jamaica.

³ Nearly all long cables are now worked on the duplex system.

⁴ On the Indian Government (Persian Gulf) system between Basra and Karachi, the speed for land line Morse was actually raised from 35 to 75 words per minute.

ries have further greatly added to the efficiency of their system by means of the Creed Printer, which is also installed on the Atlantic section of the "All Red" route, as well as in connexion with Wheatstone high-speed working on the Pacific cable land line system between Melbourne and Sydney.

A Stock Exchange Telegraph Service of a highly efficient order was established some years ago between London and New York. So efficient is this that messages are got through within ten minutes. Something like 2,500 such messages are transmitted between the two Stock Exchanges during an afternoon.

Cables and Commerce—In pre-cable days each country was, in large measure, an independent commercial unit. The submarine cable has done much to alter that state of things. Whereas in 1870 the total value of the commerce between the United States and Great Britain was about £50,000,000, in the fiscal year ending June 30 1920 it was as much as £525,000,000. Besides the enormous increase in volume of business brought about by the extension of telegraphic service across the oceans, this quickened communication has also brought a complete change in business methods. It has, indeed, introduced an element of stability into international trade such as was seriously lacking when intercourse depended solely on the mail.

The World War has tended also to increase cable traffic because of changed business habits. During the early months of the conflict a rigorous censorship on cable messages was enforced by the Allied Governments. At first codes of all kinds were prohibited, and although this regulation was subsequently modified to allow the use of ordinary commercial codes, private codes and lighter messages were stopped. As a result, many business firms discovered that for much of their cable business the time and labour spent in coding and decoding—as well as the errors which are inevitable in the transmission of unintelligible matter—made messages in plain language only slightly more expensive than code. The result after the war has been a considerable increase in the percentage of plain-language messages. Another factor in the greater traffic has been the increased use of the cables for transactions which were formerly carried on by mail. This has been due partly to changed conditions which have made speedy communication more than ever necessary, and partly to the fact that the business houses, which were forced to increase their use of the cables during the war, have continued to do so on discovering the great convenience of cable communication in comparison with the mail.

SUBMARINE CAMPAIGNS.—At the beginning of the World War the submarine was a comparatively new weapon of untried possibilities, whose ultimate place in naval warfare it was hard to foresee; and there ensued a period of tentative effort, confined at first to the North Sea, which lasted from Aug. 1914 to Feb. 1915. Germany started the war with 28 submarines, but the unreliable nature of the Korting engines fitted in the first 18 boats (U1-U18) had given her a low opinion of their merits. This was accentuated by the result of the first operation of the war consisting of a sortie by 10 boats up the North Sea, in which U15 was rammed by the light cruiser "Birmingham" on Aug. 9 1914 and U13 disappeared. On the British side some 56 submarines were available, the newest boats of the D and E class being attached to the 8th Flotilla (18 boats) employed under Commodore Roger Keyes in guarding the approach to Dover Straits with a couple (E6 and E8) reconnoitring in the Bight.

Early Days of the War.—Submarines did not play a decisive part in the Heligoland Bight action on Aug. 28. The six British submarines present were disconcerted by the unexpected appearance of British light cruisers, and the German submarines were retained off Heligoland guarding the approach to the river. The first British warship to be sunk by submarines was the "Pathfinder," a small cruiser torpedoed by U21 (Otto Hersing), off the Forth on Sept. 5, an incident which aroused little comment beyond emphasizing the danger of old ships patrolling on

regular beats. The sinking of the "Cressy," "Hogue" and "Aboukir" off the Dutch coast on Sept. 23 1914 was a much heavier blow. They had been sent to patrol on the Broad Fourteens, between England and Holland, and were steaming slowly in line abreast two miles apart at 6:30 A.M. when the "Aboukir," "Hogue" and "Cressy" were torpedoed in quick succession. This was the work of Otto Weddigen in U6, and the wholesale disappearance of Cruiser Force C within an hour with a loss of over 1,400 men came as an unpleasant shock, and definitely established the power of the new weapon. By the end of Sept. submarines were pushing past Dover Straits into the Channel, and on Oct. 16 1914 the fear of the new weapon reached a climax when on a false alarm of one in Scapa Flow the British Grand fleet hastily put to sea at night and proceeded to Lough Swilly where by a freak of misfortune the "Audacious" ran on a mine and was lost. Oct. 20 1914 had seen the sinking of the first merchant ship, the ss. "Glitra," off Norway by U17, but it was not until Nov. 23 that U18 actually attempted to enter the Flow. The Grand fleet were at sea at the time and U18 was rammed by a minesweeper, the "Dorothy Gray," close to the Hoxa entrance. She went down to 11 fathoms with her hydroplanes damaged, and coming to the surface later was rammed by the destroyer "Garry" and forced to surrender, the first and (with the exception of UBR16 in 1918) the last attempt to enter Scapa Flow.

Defensive Methods—The war found the British navy almost destitute of defensive methods against the submarine. A committee had sat on the subject but had evolved nothing but the modified sweep—a somewhat clumsy contrivance consisting of a line of explosive charges towed astern, regulated in depth by a water-kite and fired from inboard. The defence of Scapa had been mooted as early as 1912, and Adml. Jellicoe, then at the Admiralty, had taken an important part in discussions on the subject, but nothing had been done beyond allocating a small sum for the purpose in 1913, which was diverted to Dover to build a wall on the breakwater, in pursuance of the pre-war tendency to try and fit prospective wars into the existing naval ports. By the end of 1914 Cromarty had been supplied with Capt. Donald Monro's boom, but Scapa with all its entrances was not secure till Feb. 1915. Counter measures at this stage of the war were confined to an extensive development of the Auxiliary Patrol organization, the tentative supply of defensive armament to merchant shipping, and the equipment of a comparatively small number of vessels with the modified sweep. The trawlers of the Auxiliary Patrol played an important part in minesweeping and in escort work, but were too slow and too poorly armed to be really effective in offensive operations against the submarine. By the end of 1914 the submarine was generally recognized as a new and powerful weapon in naval warfare, though its tremendous potency as an instrument of the *guerre de course* had not been fully realized. Germany had lost 7 and with the addition of 12 had 30 now available, with 42 U boats and 127 UB and UC under construction and on order. Von Tirpitz, fully alive to their possibilities, was already building great hopes on them.

The early morning of New Year's Day 1915 saw the old battleship "Formidable" (Capt. A. N. Loxley) fall a victim to U24 off Start Point while patrolling up and down with the Channel fleet at 10 knots. The captain went down with the ship. Only 141 were saved out of a crew of over 800, and the incident demolished once and for all the opinion of a certain school of naval thought that the submarine could be ignored.

They were now going farther afield. Otto Hersing in U27 made his first cruise to the Irish Sea in Jan. 1915, and this month too saw the first instances of a ship being torpedoed without warning in the case of the British ss. "Tokemaru" and ss. "Ikaria" off Havre on Jan. 30 by U20 (Schwieger, who was to earn an unenviable reputation for ruthless warfare).

Campaigns of 1915.—Feb. 4 1915 saw the close of what may be termed the preliminary phase of submarine warfare. The German naval staff now decided to conduct a general campaign against merchant shipping, and on this date the German Government issued a declaration constituting all waters round Great Britain and Ireland a war zone (*Kriegsgebiet*), in which from

Feb. 4 all enemy merchant ships would be destroyed without it being always possible to avoid danger to passengers or crew, and where even neutral vessels would be exposed to danger of attack. This evoked on Feb. 11 a strong protest from the United States denouncing it as an indefensible violation of neutral rights. The date was postponed to Feb. 18 and the order modified to the extent that neutral ships were to be spared, though in adjudging their neutrality all circumstances and not the flag only were to be taken into account. March 18 1915 saw the end of Otto Weddigen in U20 which was on her way home round Great Britain, about half-way between Kinnaird Head and Norway, when she was rammed by the battleship "Dreadnought" after attacking the battleship "Marlborough." The inauguration of the new campaign was followed in March by the establishment of the Flanders flotilla, which at first consisted of small UB and UC boats working chiefly round the Thames and east coast. By Oct. 1915 it had grown to 16 boats, and was contributing a fair proportion of the ships sunk.

The Flanders flotilla had hardly started its career when it met with a formidable obstacle in Dover Straits. Experiments had been proceeding for some months in the use of steel wire nets to indicate and obstruct the passage of submarines, and the admiral at Dover (Rear-Adml. Hon. Horace Hood) now succeeded in closing the Straits by this means for over four months. The nets used were in lengths of 100 yds. and 60 or 30 ft. deep, shot by drifters, and by Feb. 13 1915 he had some 30 drifters riding to their nets in the Straits. Bad weather took a heavy toll of the equipment, but the results were surprisingly successful to an extent hardly appreciated at the time. U8 fouled one of these nets on March 8 1915 off the Varne and was forced to come up by the destroyer "Ghurka," which exploded a modified sweep over her. U37 went down the Channel later in the month and never returned. Early in April U32 got caught in a net, and had so much difficulty in getting clear that she went home north-about. She drew a formidable picture of the obstruction, and on the strength of her report the Right flotillas received instructions to go northabout, and the Flanders boats following their example also eschewed the Straits for over four months. It was thought at first that in the net a permanent antidote to the submarine had been found, and net bases were established at several ports, particularly at Larnes for the North Channel, but technical difficulties (clips and indicator buoys) supervened, and the Germans overcame the lighter form of net by net cutters.

The sinking of the liners "Falaba," "Lusitania" and "Arabic" constituted three beacons in the 1915 campaign. The former, an Elder Dempster liner of 4,806 tons on the way to Sierra Leone, was torpedoed with five minutes' warning on March 27 by U28 off the south of Ireland, and sank in eight minutes with the loss of over 100 lives. The indignation arising from this incident had hardly subsided when it was fanned to fever heat by one of the most momentous incidents of the war. On May 7 1915 Schwieger in U20 was off the Old Head of Kinsale (south of Ireland) when he sighted a great liner homeward bound. This was the "Lusitania" going only 18 knots, her decks crowded with women and children. At 2:15 P.M. he sent two torpedoes into her without warning and she went down in 20 minutes with the loss of 1,198 lives, while Schwieger "moved with mixed feelings" watched the terrific scene. A chorus of applause arose in Germany, but the deed can be seen now as an error of the first magnitude, which set on foot the whole train of circumstances which brought America into the war. The controversy between the German naval staff and the Chancellor immediately reached a crisis. The latter refused to be responsible for such acts, and on June 5, 1915 an imperial order was issued forbidding the sinking of large passenger vessels. Von Tirpitz, the Secretary of State, was furious, and he and Bachmann, the chief of the naval staff, both sent in their resignations, but were commanded bluntly to remain at their posts.

Meanwhile Otto Hersing, the pioneer in distant fields, had sailed on April 25 in U21 for the Mediterranean. Arrangements had been made to provide him with oil on the way, probably in the vicinity of Tangiers, but they broke down, and he arrived

at Cattaro on May 13 with only half a ton of oil fuel left. He reached the Dardanelles on May 25 and instantly made his presence felt. The "Vengeance" was missed by a torpedo that day; the old battleship "Triumph" supporting the Anzacs off Gaba Tepe was hit by two torpedoes at 12:30 P.M. and turned turtle in nine minutes with a loss of over 200 lives. Two days later (May 27) the "Majestic," supporting the troops inside the Straits, was hit and capized with the loss of 49 men. The whole system of naval bombardment received a severe shock, though it was not till Aug. 13, when the "Royal Edward" was sunk near Kos by UB14, that the transports began to suffer.

By this time another counter to the submarine had been found in the decoy ship, whose early type consisted of trawlers or vessels with submarines in tow. Three submarines were sunk in this way during the summer of 1915 (U40 on June 23 by C24, U23 on July 20 by C27, and U36 on July 24 by the "Prince Charles"). Aug. 19 1915 saw the destruction in the approach to St. George's Channel by the decoy ship "Baralong" of U27, while she was attacking the "Nicosian." Several German sailors had boarded the latter vessel, and the American cattlemen in her, when they saw the submarine disappear, fell on them and threw them overboard. Germany gave vent to a roar of indignation, undisturbed by the fact that the very day U27 was sunk U24 (Schneider) met the White Star liner "Arabic" outward bound off the south of Ireland and sank her without warning with the loss of 44 lives. Indignation in America flamed up anew. Again at great headquarters von Tirpitz wrestled with the Chancellor and again the Chancellor won the day. The use of decoy ships and defensively armed merchantmen, by increasing the danger of coming to the surface, provided the German naval staff with a strong argument for unrestricted warfare, but the imperial decision went in favour of the Chancellor, and orders were issued on Aug. 30 that no liners were to be sunk without warning and due regard for the safety of passengers. This was a bitter blow to the partisans of submarine warfare, and Adml. Bachmann, the chief of the naval staff, who had not been consulted on the issue, resigned and was succeeded by Adml. von Holtzendorff. The commander-in-chief of the High Sea fleet, Adml. von Pohl, also asked to be relieved, but to no purpose. He was told he did not understand the political situation. On Sept. 20 1915 further orders were issued to suspend submarine warfare on the west coast and in the Channel. The campaign now languished in British waters. From Sept. 1915 to Feb. 1916 activity against merchant shipping practically ceased in the North and was transferred to the Mediterranean.

During the year Feb. 1915 to Jan. 1916 a total of 394 Allied and neutral ships had been sunk by submarines with a gross tonnage of 1,059,141 tons, of these 225 (760,440 tons) were British, 54 of which had been sunk in the Mediterranean. Some 60 merchant ships had been sunk without warning during the year and 17 submarines had been destroyed, an average of one submarine for 23.1 ships.

The Baltic.—Meanwhile British submarines had been active in the Baltic and the Dardanelles, where a great field had opened to British heroism. In the Baltic E9 (Comdr. Max Horton) and E1 (Comdr. N. F. Laurence) were the first to penetrate early in 1915, and proved a valuable addition to the Russian (Adml. Essen's) force. On July 2 1915, when the Russians sank the minelayer "Albatross," E9 sent two torpedoes into the old cruiser "Prinz Adalbert" and drove her back to port. On Aug. 4 1915 E13 ran ashore on the Danish island of Saltholm while passing the Sound. Before the 24 hours given her by the Danes to get off had elapsed two German destroyers appeared and, opening fire on her, killed half the crew, an act which did not pass unavenged. The Germans at the time were making a determined attempt to force the Gulf of Riga with a view to operating on the Russian flank, and the battle-cruisers of the 1st Scouting Group with the 1st Battle Squadron and a number of light cruisers had been lent for this purpose by the High Sea fleet. E1 now appeared on the scene, and the very day that E13 received its deadly hail of fire sent a torpedo into the battle-cruiser "Moltke" off the Gulf of Riga, driving her back to port.

Winter did not stop the activity of the British submarines. In the latter part of 1915 E8, E9 and E19 (Comdr. F. A. N. Cromie) attacked the important iron ore trade from Lulea (Sweden) to Germany, and between Oct. 11 and 23 sank 14 large German steamers engaged in it. The "Prinz Adalbert" too was sunk by E8 on Nov. 8, and on Dec. 12 the light cruiser "Bremen" and destroyer V191 were sent to the bottom. The Germans now set to work vigorously to devise counter measures. Minefields were laid in the Sound off Drogden, in the Flint-Rinne at the southern end of the passage on the Swedish side and at Falsterbo; an old battleship was stationed to defend them, torpedo flotillas were despatched to patrol the entrance to the Baltic, and convoy flotillas were organized for the Swedish trade with the result that British submarine activity suffered a severe check and the difficulty of entering the Baltic was greatly increased. The work of submarines there was also seriously hampered by the inability of the Russian dockyards to cope with their demands, an unmistakable indication of the probable failure of any attempt to conduct a big campaign in that sea.

The Mediterranean.—In the Mediterranean the ability of submarines to assist the Dardanelles campaign by interfering with Turkish transport in the Sea of Marmora was fully realized, but the passage of the Dardanelles was not an easy proposition. Twenty-seven miles long with a width of only a mile in the famous Narrows (the $\frac{3}{4}$ m. stretch between Chanak and Nagara) lent itself easily to defence, and could be transformed into a veritable trap for submarines. It is impossible to give the details of every passage where every passage was an heroic venture. Lt.-Comdr. Norman Holbrook had made the passage on Dec. 11 1914 in B11 and torpedoed an old battleship, the "Messidiyeh." E15 (Lt.-Comdr. T. S. Brodie) was now the first to go up on April 15, but grounded in Kepez Bay (on the Asiatic side some 10 m. up) and was lost, his ship being torpedoed later by a picket boat under Lt.-Comdr. Eric Robinson, to prevent it falling into the hands of the Turks. E14 (Lt.-Comdr. E. C. Boyle) followed, passing Chanak on the surface and running submerged for forty-four hours. She sank three ships, including the transport "Gul Gemel" with 6,000 troops, bringing her commander a V.C. AE2 (Lt.-Comdr. H. H. G. Stoker) made the passage on April 25, diving under the minefields, but on the 30th broke surface suddenly, and coming under fire was forced to the surface and sunk. On May 1 the French submarine "Joule" attempted the passage and succumbed to a mine. E11 (Lt.-Comdr. M. E. Nasmith) passed safely at the end of May, sank 10 ships, penetrated into the Bosphorus and torpedoed the transport "Stamboul" and an ammunition ship there. Passing Kilid Bahr on his way back, her commander found a large mine perched in the bows which he dropped neatly by dipping and going astern, and won a V.C. in its place. E12 (Lt.-Comdr. Kenneth M. Bruce), E7 (Lt.-Comdr. A. D. Cochrane), E2 (Comdr. David Stocks), E20 (Lt.-Comdr. C. H. Warren) and H1 (Lt. Wilfred Pirie) followed, doing the same heroic work in difficult and dangerous waters. E14 was up again in July and sank 22 ships, great and small, including a 5,000-ton steamer on Aug. 7, and clearing the Sea of Marmora. He was assisted in this task by E11, who sank the old battleship "Hairedin Barbarossa" the same day and the transports "Chios" and "Samsoun" with the ammunition ships "Espahan" and "Tenedos" a week or so later. By this time a powerful barrage had been laid at Nagara, greatly increasing the risk of the passage. The French submarine "Mariotte" encountered an enemy submarine and was sunk (July 26) and E2 on her way in got badly entangled in the Nagara obstruction, but managed after 10 minutes' plunging about to get clear. E7 was not so fortunate. Going up on Aug. 4 she got enmeshed in the nets, and after the explosion of three mines in her vicinity was forced to the surface and sunk. E12, who followed in Sept., remained up 40 days with E20 and H1 in her company for a time and sank 37 ships. On the way down she fouled a net in the Narrows and went down to 245 ft., with the hydroplanes jammed and the conning tower flooded; finally she struck the chain moorings at Kilid Bahr which swept away the entanglement, and though she broke surface and came under fire managed

to win through. The French submarine "Turquoise" was sunk by gunfire on Oct. 30 1915, and a final toll of British boats was taken in E20 (Lt.-Comdr. C. H. Warren) which fell a victim to stratagem after passing through the Narrows. With the help of an Allied code probably taken from a captured submarine she was inveigled to a rendezvous and torpedoed by UB14 on Nov. 6. E11 remained up a record period of 48 days in Nov. and Dec., sinking 46 ships of different sizes. The last submarine to make the hazardous passage was E2, which was recalled on Jan. 2, a week before the final evacuation, and got safely through.

For the latter part of the year 1915 two submarines had usually been working in the Sea of Marmora at a time. Altogether some 32 passages had been made or attempted by submarines, and though they had incurred the loss of 7 of their number (E15, AE2, E7, E20, "Joule," "Mariotte" and "Turquoise," their efforts had met with a large degree of success. The Sea of Marmora had been made unsafe, the Turks had been forced to send their troops by a roundabout route—by rail to Rodost and then a three days' march to Gallipoli. Their tale of losses included two old battleships, one destroyer, 12 sloops and small craft, 7 transports, and no less than 197 vessels of all sorts and sizes, steam and sail, of which 36 were over 1,000 tons. This was the end of the Dardanelles submarine campaign, whose record fills a golden page in the annals of the navy.

In the autumn of 1915, when activity in British waters diminished, five more German submarines were sent to the Mediterranean. With them went Max Valentiner in U38 and Arnaud de la Penière in U35, two of the most distinguished German submarine commanders. The result was immediately evident. Valentiner, on his way from Gibraltar to Cattaro alone sank a round dozen of ships, including the Italian liner "Ancona" with a loss of over 200 lives, and the sinkings in the Mediterranean in Nov. went up to 23 chiefly off Crete, Malta and Tunis. They were nearly all merchant ships. No more men of war fell to them, and out of 242 transports only three were lost, the "Royal Edward" (Aug. 13, loss of life 955), "Ramazan" (Sept. 10) and the "Marquette" on Oct. 23. On Dec. 30 1915 Valentiner sank the P. & O. liner "Persia" (7,974 tons) off Crete without warning with a loss of 334 lives, but Germany refused to admit that it was one of her submarines and tried to transfer the responsibility to Austria. This brought the year 1915 to an end, a year fertile in hope and speculation, begetting vast promises of further success. To all Germany the future of her navy lay beneath the waters, though few could read the riddle as far as the bottom of Scapa Flow.

Types of German Submarines.—A short digression may be inserted here on the general types and characteristics of German submarines. They comprised four main classes—converted mercantiles (Deutschland class), U boats, UB and UC. The converted mercantile numbered a bare half-dozen (U151-U155) and were used chiefly off the Azores and in 1918 off the coast of America. They were about 213 ft. long, large, slow and clumsy, going about nine knots only on the surface, but capable of remaining out for three to five months. They had a good armament of two 5.9-in. guns, six torpedo tubes (4 bow, 2 beam) and 30 torpedoes. The U boats were the principal type, and were large boats which did most of their work in the Atlantic approaches. They were 210-225 ft. long, could go 14-17 knots on the surface, and 8-9 knots submerged. They could only maintain this speed submerged for an hour or so, but could continue at a speed of about two knots for as much as 48 hours; then, like all submarines, they had to come to the surface and recharge their batteries with the help of their Diesel motors. They carried two guns (usually one 4.1 in. and one 22-pounder), with 4 to 6 torpedo tubes and 8 to 12 torpedoes, and remained out generally from 25-30 days. There was also a special class of U minelayers, which originally numbered 10, viz. U71-U80, carrying 36 mines and 2 torpedoes. They had only a single hull and were slow boats, rarely cruising at more than 5 knots. Though the work on the west coast of Scotland and off the Dutch coast in 1918 was done by these boats they were not as a class very successful, and by 1918 there were only 5 of them left. The UB boats were originally built for coastal work, and the first 17 were small boats capable of being sent in sections overland. The earlier boats could remain out from 7-14 days, the later boats from 14-24 days. They carried one gun forward (a 4.1 in. or 22-pounder) and the earlier boats 2 to 6 torpedoes, which were increased to 5 tubes (4 bow, 1 stern) and 10 torpedoes in the later type. The UC boats were essentially minelayers, carrying one 22-pounder forward, 3 tubes with 4 to 6 torpedoes, and 18 mines. They remained out

from 10-20 days in the North Sea, but when working in the Channel from Flanders rarely more than twelve. Submarines cruised normally on the surface. When attacking they usually proceeded at periscope depth (about 45 ft. for U boats), cruising at 65-85 ft., and going to 150 ft. if attacked. The fact that a periscope was rarely visible, even with glasses, at over a mile, emphasizes the difficulty of counter-attack.

German Submarine Flotillas.—The flotillas were distributed in four principal commands—the North Sea (or High Sea fleet) flotillas working from the Bight and usually termed the North Sea flotillas; the Flanders flotillas working from Zeebrugge, the Mediterranean based on Pola, Cattaro and Constantinople, and the Baltic (or Kurland) flotilla working from Baltic ports. The Flanders flotilla consisted wholly of UB and UC boats and was allotted a definite area of operations, which extended on the east coast of Great Britain as far as Flamborough Head (Yorks), and in the Channel as far as 7° W. (about as far as Waterford) and down to the Gironde. At the beginning of the year 1916 the strength of the various flotillas was approximately North Sea 16, Baltic 6, Flanders 18, Mediterranean 12. There were 16 boats approaching completion, and 161 boats building and being delivered at the rate of 8 to 10 a month.

Campaign of 1916.—The year 1916 was marked by another long-drawn-out controversy between the German Chancellor and the naval staff. The Chancellor stood out against unrestricted naval warfare (that is sinking at sight), the naval staff fought for it. Nor were their arguments lacking in force. If a submarine came to the surface at a distance a ship could run away, if it rose close at hand it was exposed to fire from an armed merchantman or decoy ship. In Jan. 1916 the German naval staff presented a memorandum claiming that unrestricted warfare would force England to make peace in six months. It stated that from Feb. to Oct. 1915 one or two steamers, averaging 4,085 tons, had been sunk daily by each submarine. This was an exaggerated estimate, for the figures for British ships in 1915 were more nearly one-third of a ship per submarine per day, but on this basis they calculated a loss of 631,000 tons a month, at which rate it was estimated that England would be reduced to her knees in six months. A definitive audience took place at Great Headquarters on March 6, 1916, when it was decided to postpone its execution till April 1 in order to bring all possible means of persuasion to bear on the United States in the attempt to reconcile them to the idea.

Von Tirpitz, in despair at the continual frustration of his plans, resigned, and his place was taken by Adml. von Capelle. Five days before the prescribed date UB18 (Steinbrinck) torpedoed the "Sussex" on March 24, 1916 on her way from Folkestone to Dieppe with 25 American citizens on board; and though she remained afloat, the forepart of the vessel was blown up and some 80 passengers were killed and injured. America's patience now came to an end, and on April 18 President Wilson threatened to break off diplomatic relations. The German Government gave way, and abandoning the idea of ruthless warfare issued an order on April 25 precluding submarines from sinking any merchant ship at sight, and requiring them in their war against trade to act in strict accordance with the methods prescribed by prize law, which entailed stopping a ship, examining her papers and giving all the crew and passengers an opportunity to leave her before proceeding to any act of destruction.

Meanwhile the chief of the naval staff at Berlin had issued an order, which came into force on Feb. 29, 1916, that armed merchantmen were to be regarded as warships, and the attention of German submarine commanders was called to a clause in the prize regulations under which all merchantmen which might attack a German or neutral ship were to be regarded as pirates. This found its sequel on March 28, when Capt. Fryatt in his ship the "Brussels" attacked U33 on her way to Holland, and, being captured with his ship by a German destroyer on June 23, was tried and shot (July 27, 1916).

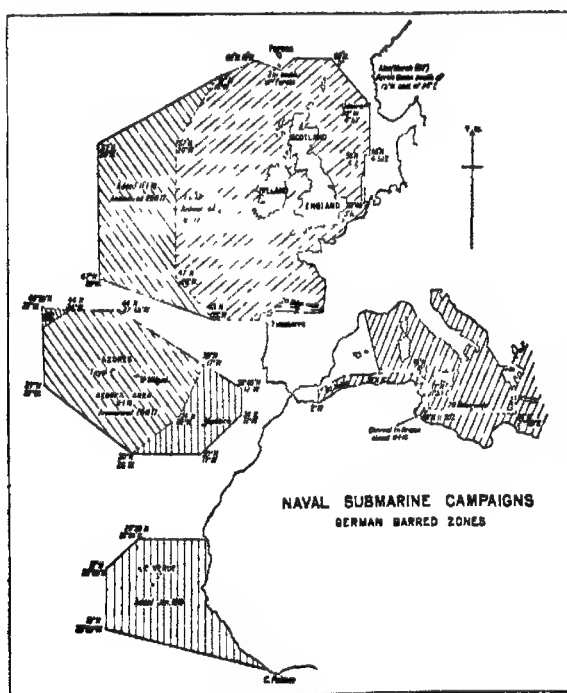

The decision against unrestricted warfare came as a bitter disappointment to Adml. Scheer, who received the order on his way to carry out the Lowestoft raid on April 25, 1916. He immediately recalled all the High Sea fleet submarines and ordered them to cease operations against merchant shipping. He refused to have anything to do with what he called the blunt edge of the weapon, and had decided that if they were not to be used in unrestricted warfare he would use them only in fleet operations.

The Flanders command followed suit with most of its boats, and the Mediterranean flotillas were left to continue the campaign against commerce alone. Just as Adml. Scheer's order went out an extensive barrage was being laid off the Belgian coast (April 24) by the Dover Patrol (Vice-Adml. Sir Reginald Bacon). This was an effort on a large scale to cope with the submarine by a combination of mines and mine-nets. It consisted of some 18 m. of moored nets fitted with net mines, supported by lines of mines, running parallel to and about 12 m. off the Belgian coast. It was completed by May 7, 1916 and a patrol was maintained on it by day from May to October. It is difficult to estimate its precise value, for the diminished activity ascribed to it at Dover was undoubtedly due to the cessation of submarine operations on political grounds from May to Sept. 1916. No doubt it made work more difficult for Flanders submarines, but the mines were poor and notoriously ineffective. A single boat (UB3) was destroyed in its vicinity the day it was laid by a lance bomb thrown from a drifter, the "Gleaner of the Sea." Another (UB10) ran into it and took eight hours to clear with net mines exploding all round her, and though the work entailed in the barrage deserves a generous meed of praise no submarine was actually destroyed by it in 1916, and it certainly never prevented the entry and exit of the Flanders boats.

Steinbrinck, of the Flanders flotilla, was now sent to cruise in the Channel to report on the feasibility of warfare on the lines of prize law, which involved the stoppage and due warning of ships before destruction. His report was unfavourable, and during the summer the Flanders boats worked only on the E. coast. Scheer meanwhile used his Bight flotilla (reinforced with Flanders boats) in fleet operations, of which the most important were those of Jutland and Aug. 19, when the "Nottingham" and "Falmouth" were sunk by U52 and U66. It was on this latter occasion that E23 (Lt.-Comdr. Robert Turner) torpedoed the German battleship "Westfalen" on its way out of the Bight. This was at 5:30 A.M., and on rising to the surface later at 10.10 A.M. he reported the German fleet to the C-in-C., then some 180 m. off, an incident which first brought into prominence the possibilities of the submarine in fleet reconnaissance work. During the summer the chief of the German naval staff was trying to persuade Scheer to modify his "harsh professional conception" of submarine warfare, and resume restricted war against commerce in accordance with prize law. The Mediterranean submarines had continued working on these lines with good results; the Flanders flotilla had recommenced on a small scale in Sept. 1916, and the operations in concert with the fleet had only resulted in the sinking of two light cruisers. The "Deutschland," under Capt. Paul König, tried a trading venture across the Atlantic during the summer, reaching America on July 9, 1916 and returning on Aug. 23 with a cargo of rubber, nickel, and tin, but the "Bremen" which followed her in Sept. was lost. U53, under Lt.-Comdr. Hans Rowe, a skilful and chivalrous commander, crossed the Atlantic (leaving on Sept. 17 and arriving on Oct. 7) and sunk five merchantmen off Newport News. The "Deutschland" made a second trip across, arriving in New London on Nov. 1 and reaching Germany safely on Dec. 10, 1916. There her mercantile career ended, and she was fitted out as a submarine-of-war and went off to work in the Azores. Archangel too became a sphere of activity for a time, and seven ships were sunk there in Oct., but the initial success did not continue, and in Nov. U56 was sunk by Russian patrols. The German naval staff now decided that all flotillas were to resume the campaign against commerce in accordance with prize law, and orders to this effect were issued on Oct. 6, 1916. Scheer had underestimated the power of legitimate warfare. The monthly average of all Allied and neutral merchant ships sunk by submarines had been 76 ships and 153,521 tons (gross) from Feb. to Sept. 1916. From Oct. 1916 to Jan. 1917 the average rose to 173 ships and 346,405 tons, and the campaign was extended with success to the Azores, Canaries and Madeira, where Funchal was bombarded on Dec. 3 by a converted mercantile.

"Unrestricted" Warfare, 1917.—But during the autumn Scheer and the naval staff found powerful allies for the policy

of unrestricted warfare in Hindenburg and Ludendorff. The topic was again discussed on Sept. 3 1916 at Great Headquarters at Pless in the presence of the Chancellor, Hindenburg, Ludendorff and Adml. von Holtzendorff, and it was finally decided to postpone it till an effort had been made to come to terms. Then followed the note of Dec. 12 1916 calling on the Allies to avoid further bloodshed, and on Dec. 22 the naval staff presented another memorandum in which it was hoped to reduce British shipping by 39% in five months, on a basis of 600,000 tons monthly, an estimate which turned out to be excessive, for by June 1917 British shipping had been reduced only from 18.2 to 16.6 million tons, a reduction of only 9.1%. The offer to negotiate was rejected by the Allies, and it was decided on Jan. 9 1917 to commence unrestricted warfare on Feb. 1 1917. All Germany was waiting for the decision. The Reichstag listened to the Chancellor's announcement in breathless silence, and on Feb. 3 the American ambassador left Berlin. Germany now had 148 submarines, of which 28 were in the Mediterranean and some 20 in Flanders. She had commenced with 28 and had lost 51. The repairs incurred at Jutland, the provision of patrol vessels and the vacillations of policy had reacted on submarine building, and von Capelle had only laid down 90 boats to Tirpitz's 186, but during 1917 269 more were ordered and it was hoped to keep pace with the demand. The barred zone announced by Germany on Jan. 31 1917 in which all shipping was liable to be sunk extended roughly from Terschelling (Holland) to Udsire (Norway), thence to the Faroe Is. and passing down the meridian of long. 20° W., 350 m. from the coast of Ireland, went on to Finisterre. It also included the Mediterranean with the exception of its western portion round Majorca and a narrow track 20 m. wide as far as Greece. The area round Archangel was added to it

in March 1917, and on Jan. 11 1918 it was extended to the meridian of long. 30° W., 720 m. from the coast of Ireland, and two large areas were added round the Azores and C. Verde Is.

The effects of the new campaign were quickly felt. The system under which traffic approached Great Britain on routes patrolled by ships and trawlers with a sprinkling of destroyers proved incapable of meeting the emergency. Losses of Allied merchant ships rose from 171 in Jan. to 234 in Feb., 281 in March and 373 in April. This was the black month of the war. At this rate one ship in every four that left British shores did not

return, and by Nov. 1917 the irreducible margin of shipping would probably have been reached. The effects were most severely felt in the Channel, Mediterranean and the routes south of Ireland (called the Fastnet and Scilly approaches), which were strewn with the hulls of sunken ships. The outlook was dark and perplexing to those who saw the Grand Fleet remaining mistress of a sea which was becoming a cemetery for British shipping, and had not realized the fact that the battle fleets were becoming subsidiary factors in a new form of the *guerre de course*. The efforts to deal with the situation took a threefold form. Firstly, a convoy system (see CONVOY) was introduced involving the escort of merchant shipping at sea and the control of all shipping movements; secondly, the naval staff was reorganized so as to insure a due status for the convoy system, and a planning section and anti-submarine division were added to it (see ADMIRALTY ADMINISTRATION); thirdly, invention and research were speeded up in the technical fields of mines, depth charges and hydrophones. These efforts were successful. Gradually the losses of ships went down and the losses of submarines crept up.

The enemy's operations can only be broadly described; his principal areas were the approaches to the Channel and Irish Sea, the North Sea (particularly off the Yorks. coast), the Channel and Mediterranean. The number of submarines operating varied. As a rule there might be two or three (converted mercantile) operating in the Azores and on the Dakar (W. Africa) coast, 8 or 9 U boats in the Atlantic approach (from longitude 7° to 12° W.) and on their way there and back, 4 or 5 (including a couple of Flanders UC) in the Channel and its approach, with 5 UB (Flanders) and 2 UC (Flanders) in the North Sea. In the Mediterranean there were usually 4 to 6 submarines at work, including 1 or 2 on the N. African coast, 1 or 2 round Italy, 1 perhaps off Salonika, 2 off Egypt, Syria and Crete. This gives a total of some 25-30 submarines at work. The tonnage sunk per submarine varied. Curiously enough the average bag was considerably more in the time of restricted warfare than it was in 1917-8. In the former period it was probably something like 16,000 tons a trip. U49 on her first trip in Nov. 1916 in the Channel and Bay of Biscay sank 40,000 tons, and Forstmann, Arnauld de la Perière and Max Valentiner in the Mediterranean thought little of 20,000 tons a trip in 1916. But in 1917 the average bag was probably not much more than 8,000 tons for a U boat and 3,000 for a UB or UC. In the North Sea in Jan. 1918 a U boat was fairly fortunate to get 4,000 tons, and in the Channel 6,000 tons had become a fair bag.

Progress of Counter Measures—In the anti-submarine campaign great progress was made in technical devices, and larger depth charges were supplied in greater quantities. Type D charge (300 lb. T.N.T.) entirely superseded type D* (120 lb.), and the output was increased. Destroyers carried five or six instead of one or two; some were equipped with as many as 20 or 30, and the number of submarines sunk by depth charges rose from 8 in 1917 to 15 in 1918. Decoys (generally designated Q ships) continued effective in 1917, and five submarines were sunk by them during the year. These were merchant ships manned with a trained crew and armed with guns carefully concealed by special devices. On a submarine opening fire the ship would stop and a portion of the crew called the "panic party" took to the boats, lowering them carelessly and hurriedly in the hope that the submarine would approach and board the vessel. If she did the bulwarks fell and a deadly fire was poured into her at close quarters. Capt. Gordon Campbell was the most successful exponent of this stratagem. U38 fell to his ship, the "Pargust," on Feb. 17 1917 off the southwest of Ireland, and UC29 was sunk by her on June 7 in the same area, bringing him a V.C. His last ship, the "Dunraven," sank on Aug. 10 after a heroic action with U61, in which the after gun's crew remained steady at their post with the poop blazing under them and were blown up with the gun rather than betray the nature of their ship. The "Prize," (Lt. Wm. Sanders) and the "Stoncrop" (Comdr. Morris Blackwood) were also gallant ships, the former sinking U88 out in the Atlantic on Sept. 17 and both being sunk by submarines. By Sept. 1917 the decoy had lost its efficacy, though four were

still in use in the early part of 1918. From first to last it achieved the destruction of 13 submarines with the loss of some 20 decoy ships, great and small, some like the "Prize" and "Vala" with all hands. Its place was now taken by the seaplane and P boat. The latter were low boats not easily seen in mist or at dawn and were responsible for no less than four submarines in 1917. Aircraft now began to be really effective, and in 1917 six submarines succumbed to the 300-lb bombs of large Handley-Pages in the southern portion of the North Sea. British submarines too were constantly on patrol, and were able to count six submarines to their credit by the end of the year (G13 sank UC43 off the Shetlands March 10, E54 UB1 in the Atlantic May 1; D7 U45 north of Ireland Sept. 12, E45 UC70, Oct. 19, E52 UC63 Nov. 1, in the North Sea, and C15 UC65 Nov. 3, in the Channel). The hydrophone, an instrument designed to detect submarines by sound waves under water, also developed greatly, but was more useful as a detector and in controlled minefields than in actual pursuit.

The whole system of staff work was overhauled. Direction of convoys became one of the principal functions of the naval staff and the machinery of Intelligence was adjusted in this light. Intelligence of first-rate importance derived from wireless directionals had hitherto been shrouded in secrecy and locked away in drawers for the edification of the very few. The director of Naval Intelligence (Rear-Adm. Sir W. R. Hall) at last obtained control of it, and spread it abroad and circulated it to every command. The movements of all enemy submarines hitherto veiled in secrecy were displayed on a great chart in the Convoys room, and subjected to careful analysis by the new Plans Section. In Oct. 1917 this division prepared a large mine-net operation based on careful observation of submarine tracks in September. In spite of bad weather and unfavourable circumstances three large submarines (U50, U66 and U106) found their way into the minefield and were sunk, causing a scare in the Bight which sent submarines round by the Kattegat for the first time.

Plans were prepared too for mining the Bight, but it was not till Sept. 1917 that the new mines were ready in sufficient quantity. Gradually the whole strength of the High Sea fleet had to be concentrated on getting submarines in and out. An armada of minesweepers, barrier breakers, escort forces and outpost forces were constantly at work trying to keep a passage open for them along ways which extended as far as 150 m. from Heligoland. Dover still remained a thorn in the flesh. The cessation of submarine activity in April 1916 had been erroneously attributed there to the Belgian coast barrage, and a similar barrage had accordingly been laid across the Straits in the latter part of 1916. It was composed of mine-nets 60 ft. deep with a minefield in support. But the mines were of the old defective design. They dragged into the nets, sank British ships, and had to be swept up in June and July 1917. The barrage entailed enormous labour but did not close the Straits, and from Feb. to Nov. 1917 enemy submarines passed at the rate of at least 24 passages a month. This was a serious matter, for the Dover passage saved a Flanders boat eight days on the double journey to the Channel approach out of its trip of 14 days, and a Bight boat six days out of its trip of 25 days. In Oct. the whole question became acute, for Flanders boats were responsible for some 22 ships a month in the Channel. The proper antidote was a strong minefield, and the vice-admiral at Dover had suggested in July 1917 laying a deep minefield from the Varne to Gris Nez, but the new mines were not ready and could not be supplied to Dover till Nov. It was partly laid on Nov. 21, but it was not constantly and intensively patrolled so as to make the submarines dive, with the result that between Nov. 21 and Dec. 8 21 submarines made the passage in safety. This was a severe disappointment, and instructions were sent to establish a strong patrol equipped with flares and searchlights to force the submarines down. This was done to a limited extent, and on the 10th the new minefield took its first toll in UB56. But difficulties arose in the execution of the plans and the urgency was so acute that before the end of the month Rear-Adm. Sir Roger Keyes, Director of Plans, was sent to Dover to assume the command, and the next four months saw nine sub-

marines destroyed in the Dover area. By Feb. 1918 the Bight boats had ceased to use the Straits, and by May the activity of the Flanders boats in the Channel had been enormously reduced, the blocking of Zeebrugge contributed to this result, and the losses in the Channel were reduced to six a month, the minefields laid by the Flanders boats falling from 404 in 1917 to 64 in 1918.

The year 1918 saw the commencement of a much more ambitious scheme—the Northern Barrage—which aimed at nothing less than mining with 120,000 mines the huge stretch of 240 m. between the Orkneys and Norway. (See MINESWEEPING AND MINELAYING.) This was really an immense task, complicated by a deep gut some 60 m. wide on the Norwegian side where the depths ran to 150 fathoms. The credit for its conception and execution lies largely with Adm. Sims and the U.S. Navy. It was an American enterprise performed by American sailors in American minelayers. As it was only commenced in April and was barely completed in Oct. its value is difficult to appraise, but the loss of some half-a-dozen boats can be attributed to it in Sept. and Oct. 1918. United States destroyers too were doing invaluable work in escorting convoys, and had been doing it ever since May 1917, during the dark months of 1917 when destroyers were more valuable than battleships.

The losses in the Mediterranean had given rise to serious concern, and the First Lord (Sir Eric Geddes) and the director of Naval Intelligence proceeded there in person to arrange for an extensive reorganization of the commander-in-chief's staff. Its clear waters, too deep for mines, and its regular tracks had been an ideal hunting ground for submarines. During 1917 only two German submarines had been lost there, and in the black month of April 1917 the Mediterranean had supplied one-fifth of the tonnage sunk. The arrival of some 14 Japanese destroyers in the summer brought the losses down about 10%, but in Dec. 1917, when vigorous action had greatly reduced the losses at home, the Mediterranean was still contributing 147,000 tons a month or over one-third of the whole. The convoy system was now introduced in the Mediterranean, the Otranto barrage was established and reinforced, and in May 1918 no fewer than four submarines were destroyed there. The effect of these measures was soon felt. Our losses in that sea were reduced from 95 ships a month in the last quarter of 1917 to an average of 43 in July, Aug. and Sept. 1918.

The U-boat zone had been extended to the Azores in Nov. 1917, and one or two boats had been working regularly there with fair results and comparative immunity till May 11 1918 when U154 was torpedoed by E35 about 150 m. west of Cape St. Vincent, an exploit directly due to improved intelligence.

Adm. von Capelle had been confident that his submarines would be able to prevent the U.S.A. troops reaching Europe, but actually not a single transport was lost up to Feb. 5 1918, when the "Tuscania" was torpedoed with a loss of only 44 lives out of 2,404. To stop the ceaseless flow of troops four large submarines were sent across the Atlantic, but though they destroyed over 60 ships they did not get a single loaded transport, and U156 was lost in the Northern Barrage on her way home. On July 19 1918 the great liner "Justicia," 32,234 tons, was hit by a torpedo from UB64 at 2:30 P.M. off the Skerryvore (Scotland, W. coast), and attacked again by U54 and UB124 the next morning. A whole armoury of depth charges was dropped round UB124 by the "Marne" and other destroyers, forcing her to the surface to surrender. All this time the mining of the Heligoland Bight went steadily on with the help of the gallant 20th Destroyer Flotilla (Capt. Berwick Curtis), and its exits were occasionally entirely closed. The Flanders flotilla felt the full force of the increased activity at Dover and suffered heavily. In Jan. 1918 it numbered 29 boats; it lost no less than 24 during the year and its strength dropped to 13. By the middle of 1918 it had earned the dread name of the "Drowning Flotilla," and its boats could reckon on a life of only three or four trips.

The Kattegat still remained open. In April 1918 a deep minefield was laid there, and had it been possible to keep it patrolled the submarines would have had to face another serious danger. How far this was practicable is a moot point.

SUBMARINE CAMPAIGNS

611

The reports of destruction in 1918 gradually began to fall into four categories. Either a mine demolished the boat wholesale, or an aeroplane swooped down on it with 300-lb. bombs, or a volley of depth charges forced it to the surface, or a torpedo from a British submarine brought its career to a sudden end. Depth charges competed with mines as the principal instrument of destruction (destroyers and patrols 30%, mines 30%), then came the submarine 8%, with aircraft a bad last.

It is impossible to narrate the long story of destruction. UB81 may be mentioned as an example of the unenviable career of a German submarine. On her way down Channel on Dec. 2 1917 she struck a mine off the Owers (near Portsmouth) and water began to enter by the stern. An attempt was made to bring her to the surface, but the after-tanks would not blow and her stern sank to the bottom in 90 feet. The gauges showed the bows to be out of water, and with the boat lying at an angle of about 60° a torpedo was lowered from the bow tube, and a man rammed up its narrow length. The sea cap was opened cautiously and it was found that the mouth of the tube was a couple of feet above water. Men were rammed carefully up and seven men had dragged themselves painfully out, only to find the cold so bitter and the strain so great that most of them elected to go back and join those who were seeking oblivion and death in the oxygen flasks. P32 patrolling in the vicinity saw the bows above water, but in the endeavour to get alongside the wind and waves bumped her against the submarine, which went to the bottom, leaving only a solitary survivor. Two little drifters contributed their quota to the tale. On April 17 1918 a little drifter, the "Pilot Me," whose jolly name was in itself an omen of success, working in the North Channel, suddenly sighted the periscope of UB82, 150 ft. off, and turning quickly dropped four depth charges on it. The submarine came up at an angle of 45°, and three other drifters, the "Young Fred," "Look Sharp" and "Light," all opened fire on her. She went down and the "Young Fred" dropped four depth charges on her, bringing her to a final end.

Statistics of Submarine Warfare—The dreary dreadful tale of ships sunk and attacked is too long to give (for dates and names see *Admiralty Return of British Merchant and Fishing Vessels Captured or Destroyed*, Aug. 1919, H.C. 199). It includes the names of nine hospital ships, all, with one exception, large ships whose character was unmistakable ("Asturias" March 20 1917, Channel, beached, 44 lives lost; "Gloucester Castle" March 30 1917, Channel, towed in, "Donegal" April 17 1917, Channel, sunk, 41 lost; "Gulldford Castle" April 10 1917, Bristol Channel, hit by dud torpedo; "Lanfranc" April 17 1917, off Havre, with 167 wounded Germans, sunk, 34 lost; "Dover Castle" May 26 1917, Mediterranean, sunk, 7 lost; "Rewa" Jan. 4 1918, Bristol Channel, sunk, 4 lost; "Glenart Castle" Feb. 26 1918, Bristol Channel, sunk, 95 lost; "Llandoverly Castle" June 27 1918, Atlantic). Of these the attack on the "Llandoverly Castle" by U86 (Patrig) was probably the most flagrant breach of the principles of humanity. She was homeward bound from Canada 116 m. from the Fastnets (S.W. point of Ireland). The enormous red cross of a hospital ship was lit on her side, glowing in the twilight like a lustrous jewel, when she was attacked and sunk, of the 258 persons on board, including 14 nurses, all except a boatload of 20 perished.

* (Including losses by surface craft and mines.)

In Oct. 1918 Flanders was evacuated and the remains of the flotilla blown up. It was a Flanders boat UB116 (Lt. Emmann) which made a last desperate effort to enter Scapa on Oct. 28. It was heard on the hydrophones, and seen for a moment in the search-light beam. Then came the heavy shock of an explosion and the last of the Flanders flotilla found a fitting end in the very gates of the enemy.

When the Armistice was under discussion, Scheer, who was now chief of the German naval staff, recalled all the submarines, intending to make use of them in a last desperate sortie with the fleet, but he found himself suddenly confronted with mutiny, and the fleet never sailed, though the submarines remained true. Meanwhile in the British navy the evolution of the submarine had followed a different path. Here there was a tendency to produce a type useful in reconnaissance work and able to act in tactical conjunction with the fleet. Of E class, which did yeoman service, 49 were built and 27 lost. They were vessels of 180 ft. long with three to five 18-in. tubes and a speed of 15 knots on the surface and 10 submerged. They were followed by G class (10 built in 1916, 4 lost) with better seagoing qualities and double hulls, armed with one 3-in. anti-aircraft gun and 5 tubes (four 8-in. and one 21-in. astern); their speed was 14 and 10 knots. Of J class 7 were built in 1916-7 and 1 lost. They were 270 ft. long, carried one 4-in. and six 18-in. tubes and could do 18 knots on the surface. K class were designed for fleet work, and were completed in 1917-8 (16 built, 3 lost). They were steam-driven on the surface, attaining a speed of 22 knots, 334 ft. long, and carried one 4-in., one 3-in. A.A. gun and eight 18-in. tubes. L class carried one 3-in. A.A. and six 21-in. tubes. They were 222 ft. long with a surface speed of 17 knots. Some 25 were complete in 1918 (2 lost). Of M class only 4 were ordered. They were about 200 ft. long and carried a single 12-in. 35 calibre gun which could be fired only in the direction of the bow. The design was "freakish" and displayed a lack of tactical, strategical sense. Only one was completed. R class, of which 12 were completed (none lost), was specially designed for anti-submarine work. They were short and built for quick diving and rapid manoeuvring. They carried one 3-in. gun and four 18-in. tubes. Of British submarines 54 were lost during the war. —

The question arises, How nearly did the German submarine campaign attain its aim? The increase in submarine destruction and the decrease in shipping losses possess little meaning apart from the figures of output in either case. In spite of strenuous

British effort the German submarine output more than kept pace at first with their destruction. In 1917 the net gain in submarines was approximately 45, but in 1918 the two exactly balanced (74 added, 74 lost). The shipping position depended largely on the irreducible margin which would have fulfilled British needs. This may be taken as 12½ million tons, and in addition there was always some 600,000 tons of British shipping under repair (from enemy and marine damage), requiring a total of, say, 13,000,000 tons (gross). By the end of 1918 there were 3,391 British steam vessels of over 1,000 tons, with a gross tonnage of 14,049,000.

The British shipbuilding capacity remained much the same (about 1.2 million tons a year, 1 370 million tons gross for Jan. to Oct. 1918), but net losses had been reduced to about 33,000 tons gross per month, which meant that the submarine could no longer attain its object within a reasonable time. It is true that the German output of submarines would have increased 20 or so monthly in 1919, but there is every reason to believe that the Allied navies could have dealt with it. The really critical time from Aug. 1917 to Dec. 1917 had passed. The submarine campaign had failed. On three grey Nov. days they sailed along Germany's *via dolorosa* towards Harwich, bringing to a grim and sordid conclusion one of the most tremendous chapters in the history, not only of naval warfare, but of the world.

Final Tale of German Submarines in Nov. 1918.

SUBMARINE MINES (see 26 1).—It was the Russo-Japanese War 1903-4 which saw the first use of what has been called deep-sea mining—that is to say, the application of the submarine mine to strategic and tactical uses quite distinct from its previous application for coast defence, and that war led to the intensification of development in all maritime countries.

In the World War 1914-8 Great Britain laid a total of 130,380 non-controlled mines, 1,192 controlled mines and 25,083 of a small special type of net mine; in addition, 899 British non-controlled mines were laid by a U.S. minelayer. As showing the growing intensity of mining as the war developed, British minelayers were engaged on an average number of days in each month of 2½ in 1915, 5½ in 1916, 11 in 1917, and 20 in 1918. A mine barrage across the Dover Straits contained 9,373 mines. The great Northern Barrage from the Orkney Is. to the coast of Norway contained 69,766 mines, of this number 56,033 were American mines and laid by the U.S. minelayers. The British minelayers, who were chiefly employed elsewhere, laid the remainder. British submarines laid 2,469 mines. (See generally MINELAYING AND MINESWEEPING.)

The chief naval war losses in surface ships due to the action of mines were:—

	Battleships	Cruisers	Destroyers and Torpedo Boats
Great Britain	5	3	22
France	1	1	5
Russia	1	—	6
Italy	1	—	2
United States	—	1	—
Japan	—	—	1
Germany	—	2	20
Austria	—	—	3
Turkey	—	2	—

Mines, as distinct from depth charges, accounted for the known loss of 35 German (or Austrian) submarines.

The loss of the British mercantile marine due to mines was 673,417 gross tons, besides a loss in fishing vessels of 8,545 gross tons.

Classification of Mines.—Submarine mines can be divided into two general types, controlled and non-controlled. These may be again divided, each into two divisions, contact and non-contact, and these may be further sub-divided into three classes, moored, drifting and ground. A ground mine is one which is laid actually on the bottom; it is chiefly useful in shallow waters. Drifting mines may be submerged and oscillate between set depths, may float on the surface, or may be suspended below a float; they are especially suitable for employment in river warfare. A moored mine which is the type most frequently used, is a buoyant mine anchored to the bottom by a heavy weight or "sinker," the mine being attached to its "sinker" by chain or wire rope. The "sinker" may be automatic in its working and, following an adjustment which is capable of being readily made by the layer, it will take the mine to the desired depth below the surface. The depth adjustment will be made by the layer in accordance with the draft of the enemy's ships.

Controlled mines are those which have their firing source outside the mine and directly controllable by human agency. An electric current, provided by a dynamo or battery, is conveyed to the mines by cables led along the sea bottom from a control station on shore where the current may be switched on or off as desired. In the case of contact controlled mines a break in the controlling circuit, inside the mine, is completed when the mine is struck. Sometimes this is arranged by the crushing of a horn or it may be arranged by mechanism which acts due to the inertia of the blow. In the case of non-contact controlled mines, the firing is accomplished either by the direct observation of the operator or the mines themselves are made their own observers. In the first case the observer follows the enemy vessel through a telescope, which works over a prepared chart having metal strips on it corresponding to the positions of the mines, when a plunger on the training arm attached to the telescope comes into contact with one of the metal strips, the circuit is completed to that particular mine or line of mines and the mines are fired. Where the mines are their own operators, each contains mechanism, such as a microphone, which will pick up the sound of a ship's propellers and will indicate to the operator the moment when he should fire. The observation current from the mine is conveyed to the operator by the same cables that are used to fire the mine.

Controlled mines are especially applicable to the defence of harbours, where, by nature of their control, passage of friendly ships can be permitted but, at any time if necessary, can be denied. Contact controlled mines are used chiefly in side channels, because, although they can be put to "safe," they nevertheless foul the ground and friendly ships passing might damage them or tear them from their moorings; used channels have, therefore, to be mined with non-contact controlled mines, moored at a depth below the draft of the deepest draft ship using the channel.

Controlled mines are very costly to install and maintain and they require a large personnel to tend and operate them. (See PLATE, figs 6 and 7, for types of non-contact controlled mines.)

Non-controlled mines are those which are automatic when once laid. They carry their own firing source or obtain it from the sea and have no further dependence on any human control. Mechanism is usually fitted which renders them safe during laying and for a short time afterwards, or at any time should they break adrift from their moorings. They may also be fitted with mechanism rendering them safe or disposing of them by explosion after a determined interval, and unless so fitted they must be swept up when no longer required.

There are several methods by which contact non-controlled mines are fired:—(i) Inertia, where the momentum of the blow displaces a weight or pendulum inside the mine, causing the release of a percussion firing mechanism. (ii) Mechanical lever, where the contact with a vessel displaces a rod or lever on the outside of the mine which first cocks and then releases a percussion firing mechanism. (iii) Hydrostatic, where the contact with a vessel admits water, usually by the crushing of an external horn, into a valve inside the mine, which acting under the water pressure releases percussion firing mechanism. (iv.) Electrical, which is usually of the well-known "Hertz" horn type, where contact with a vessel crushes an external horn which contains within it a bichromate solution in a glass tube. When the glass of this latter is broken, the solution flows to the plates of an electric battery, previously inert, situated within the mine at the base of the horn. The solution energizes the battery, which is electrically connected to the mine detonator, thus firing the mine. This type, though electrical in action, carries the energy in a chemical form.

In the case of non-contact non-controlled mines, firing can be accomplished by an observing mechanism, as for instance a microphone, within the mine; as a vessel approaches, the sound of her propellers is picked up by the microphone and by means of relay mechanism the mine can be made to fire when a pre-determined intensity of sound has been reached.

SUBMARINE MINES

Figs 1 and 2 show contact non-controlled mines having the horn type of firing mechanism and attached to their automatic sinkers as they would appear on board the minelayer when ready for laying. The small wheels on each side of the sinkers at the bottom engage on the rail track laid along the minelayer's deck.

Figs 3 and 4 show similar types of mines as they would appear when broken adrift from their moorings and floating on the surface.

Fig. 5 shows a special type of horned contact non-controlled mine adapted for discharge out of a torpedo tube of a submarine.

Figs 6 and 7 show types of non-contact controlled mines as they would appear when broken adrift from their moorings and floating on the surface.

Fig. 8 shows the explosion of a depth charge fired at a depth of 40 feet.

The object of such an arrangement is to increase the probability of the mine, but since in this case the mine is fired out of actual contact with the ship's hull, explosive effect is sacrificed for the gain in probability, a failing common to all types of non-contact mine. (Various types of non-controlled mines are shown in the accompanying Plate, figs. 1-5.)

Minefields.—Controlled minefields, on account of the complicated nature of material, etc., are applicable only to a limited defence of friendly shores. The mines are usually laid by small special minelayers in short lines or small groups, all the mines of a line or group being fired simultaneously where these are of the non-contact type.

Non-controlled minefields on the other hand are required on an extensive scale and in all depths of water, both for offence against the enemy and defence of friendly coasts. They may consist of "barrages" to prevent the passage of enemy vessels through definite and particular areas, "independent minefields" to inflict loss on the enemy where there is a reasonable possibility of doing so, and "mined areas," which are built up of individual minefields to inflict loss on the enemy in areas which he is obliged to use when his ships put to sea for operations or exercise. Mines are laid in lines which are either continuous or broken up into groups, but variations of a single line are more often used, especially when several minelayers are taking part in the operation together, the more usual variations being two or more parallel lines, single indented or stepped line and dog's leg line.

There are also some special forms of mining, such as the laying of "connected mines" where two or more non-controlled mines are connected together, or where, as an anti-submarine measure, the mines are suspended in nets. The object of all such systems is to increase probability, but the latter is only gained, in these cases, by complication of the material and the laying of it out.

Minelayers.—Various classes of vessels are employed for laying non-controlled minefields—(a) Large minelayers with large carrying capacity for laying "barrages," (b) Fast minelayers of moderate capacity for laying "mined areas" or "independent minefields" in enemy waters. (c) Very fast minelayers and submarine minelayers for laying small minefields close in to vulnerable points.

Submarine minelayers require special laying apparatus. Surface minelayers are usually provided with narrow-gauge rails running along the deck and ending in a discharge "trap" at the stern. The "sunkers" have two pairs of wheels which fit the rail gauge and each mine rests on top of its own sinker. The mines and sinkers are disposed in long tiers along the rails and as the minelaying proceeds the tiers are gradually hauled aft towards the traps, electrical power being usually employed for this purpose. On nearing the "trap" each "unit" is hauled off the face of the tier in succession and pushed into the "trap" from where it is let go by order.

The spacing of the mines apart varies according to circumstances, but the least distance at which mines can be spaced apart is limited to the distance at which one mine, if exploded, will not damage or countermine the next adjacent. The spacing on board the minelayer is regulated by time; the interval between successive mines being let go varies according to the speed at which the vessel is steaming and the spacing being used. Where a minelayer has more than one set of rails, it is usual to drop mines alternately from each set; this is for convenience and gives more time for the loading of each "trap." (H D B.)

Depth Charges.—A development of submarine mines which came in during the World War is the engine known as a depth charge.

This, as its name implies, is a charge of explosive which is detonated on reaching a given depth.

The explosive is carried in a mild-steel plate "charge case," to which rings are secured at the top and bottom for handling. A primer for detonating the main charge is secured in the centre of the charge case, round which primer lies the great bulk of the explosive charge and immediately above the primer is secured the "pistol." The pistol is arranged to fire the charge at varying depths.

One principle by which a depth charge may be fired consists of admitting water to a chamber containing a hydrostatic diaphragm. The pressure of the sea-water acts on the diaphragm and at the set depth causes a striker to act, thereby exploding the charge. A suitable safety arrangement is of course provided, and this consists of a safety key which cannot be withdrawn until the depth charge has been adjusted for a depth setting.

Depth charges are carried in the stern of vessels, either in chutes or on a tilting tray, and can be released either hydraulically from the forebridge, or by hand. As the depth charge sinks at a rate of 10 ft. per second, it is clear that the laying vessel must maintain a certain minimum speed to ensure herself against damage by the depth charge she has dropped. This is 10 knots.

In addition to the two methods of carrying and dropping depth charges already mentioned, an alternative is provided in some ships in the form of a depth charge thrower. This consists of a steel barrel and an "expansion chamber." Into the expansion chamber is screwed an explosion tube which on firing sets up a pressure which will throw the depth charge a distance of 40 yds. with a time of flight of four seconds.

The introduction of the depth charge was brought about in 1915 owing to the complete immunity enjoyed by a submarine immediately on submersion, notwithstanding the knowledge of a surface vessel

that the submarine was in its immediate vicinity. The introduction and rapid development of the depth charge entirely removed this sense of security, and quite apart from the destruction of 34 submarines actually achieved by this means, it produced a very great moral effect upon hostile submarines, and hampered them in attacks upon surface craft, owing to their perception of the risk of allowing their periscopes to be sighted, and thus drawing down a rain of these depth charges upon them.

Though depth charges generally cannot be depended on to vitally damage a submarine outside a range of about 30 ft. (depending on the weight of the charge), the effect on the nerves of a crew of a series of heavy explosions at a greater distance than this fatal limit is very marked, and may be regarded as one of the great uses of this weapon. In many cases in which British submarines have been subjected to a depth charge attack, the force of the explosion has caused an immense concussion inside the boat. Fig. 8 in the accompanying Plate shows the explosion of a depth charge at 40 feet. (B A.)

SUDAN (*see 26.9*).—The countries of the western and central Sudan are treated under their distinctive names; the present article deals with the Anglo-Egyptian Sudan, which, following official usage, is called the Sudan simply.

The area administered by the Sudan Government, enlarged during 1910-6 by the addition of the Lado Enclave and Darfur, was officially given in 1921 as 1,014,000 sq. miles. In the same year the pop. was estimated at over 4,000,000, which compared with an estimate of 1,853,000 in 1905. Nearly half the people are primitive negroid tribes living in the equatorial belt. Khartum, including Khartum North, had 39,056 inhabitants in 1921, Onidurnian 59,429.

Economic and Social Conditions.—The years 1910-2 were years of prosperity, so much so that in April 1912 Lord Kitchener declared that "there is now hardly a poor man in the Sudan." But in that year the country experienced low floods and poor rains, while the 1913 Nile flood was one of the lowest on record. The rains, scanty at the best, failed altogether in some districts. The result was that 1913 and 1914 were years of acute agricultural and trade depression. 1914 was described as perhaps the most difficult, from the point of revenue and the economic situation, experienced in the history of the Sudan. Trade suffered another shock with the outbreak of the World War. Abundant rains in the autumn and a high Nile happily resulted in providing the country with an ample supply of food-stuffs. Yet 1915 was little better than 1914. War conditions and the scarcity of shipping had caused a much lessened demand for the produce of the country. The cultivators, who form the majority of the people, "while they had enough to eat, were short of ready money" and hard pressed to pay their taxes. European conditions were indeed closely reproduced in the Sudan so far as commerce and economics were concerned. This was seen in 1916 when a period of comparative prosperity set in, though this was also due in part to abundant rains and a good flood in 1915. "The influence of the war," said the official report issued in 1920, "which had had such a depressing effect on trade in 1914 and 1915, began to operate in the reverse direction, and a great impetus was given to the export trade through an unprecedented demand for Sudan products. The presence of a large body of British troops in Egypt requiring grain and live stock, the demand created on the Arabian coast for Sudan millet, and in England and Allied and neutral countries for cotton and gum enabled all these commodities to be disposed of freely."

The experience of 1916 was repeated in 1917 and 1918 and, although there was a low Nile and poor rains in 1918, the country suffered no serious setback in 1919. Conditions in 1920 were influenced by the world depression in trade, nevertheless the year (following average rains and a medium flood in 1919) proved one of fair prosperity.

In considering the productivity and industry of the country it should be remembered that the Sudan consists of three natural zones, the desert zone in the north, where cultivation is only possible in a narrow strip on either bank of the Nile; a central zone where there are large areas of fertility, including the rainlands of Kassala and of Tokar, the Gezira plain, the pastures and gum-forests of Kordofan; and a southern belt, where the soil is richest and the rain tropical. But this southern

belt up to 1921 yielded very little, for the negroid tribes which inhabit it showed scant inclination to do more than supply their own needs, while the lack of communications over enormous distances and the difficulties of administration rendered development by outside agencies extremely hazardous. Timber was, however, obtained from the forests of the Bahr el Ghazal and Lado and a (diminishing) quantity of ivory.

Apart from the tribes of this southern zone—and even among them progress in civilization was made—the people of the Sudan, negro and "Arab,"¹ showed willingness, in many cases eagerness, to benefit by Western civilization. Their standard of living became more exacting and their desire for education greater. Moreover, the possibilities and advantages of trade, through the World War, had been brought home to a larger number of the population than before. "There has been," wrote the governor-general, Sir Lee Stack, in April 1920, "an advance in energy and initiative, particularly among those who make their living by cultivation."

Products and Trade.—Gum arabic is perhaps the most characteristic product of the Sudan, which provides the bulk of the world's supply. Formerly the only Sudan product in which Germany had a direct interest, the largest share of the gum trade is now with Great Britain. In 1913 the export of gum was 336,000 kantars, it fell to 258,000 kantars in 1915 and was 344,000 kantars in 1919 (a kantar equals 99.049 pounds). The value of the gum varied in the period named from £E314,000 to £E744,000. The principal crops are durra (millet) and cotton. As the area cultivated depends upon an uncertain rainfall and an equally uncertain Nile flood, the amount produced is liable to great variations. In 1915 the total area under cultivation was 2,463,000 feddans, in 1916 it fell to 1,489,000 feddans, was over 2,000,000 in 1917 and but 1,669,000 in 1919 (a feddan equals 1.038 acre). Nor in respect to durra does the export correspond to the crop raised. Much of the grain is home-consumed and only the surplus sent abroad. The durra exported in 1913 was 2,080 tons; in 1914 only 530 tons. Exports rose to 84,000 tons in 1917 and fell to 1,650 tons in 1919. The total export of durra for the five years 1915-9 was 245,300 tons, against 53,500 tons in 1910-4.

Great expectations were held as to the development of the area under cotton by irrigation, but the financial situation created by the war rendered any large extension impossible for the time being. The variation in output was great—9,400 bales (of 400 lb.) in 1914; 23,900 bales in 1915; 12,300 bales in 1919. The total export of cotton in the 10 years 1910-9 was 161,000 bales. The yearly fluctuation was mainly due to the variation in the crop of flood-grown cotton in the Tokar district, Red Sea province. Only by irrigation works and by the building of railways to afford the cotton districts rapid and cheap means of access to the world's markets could any great increase of the crop be expected (see below: *Irrigation and Communications*).

Besides gum, cotton and durra the chief exports were cattle and sheep, hides and skins and sesame. The extent to which the export of live stock was stimulated during the war is shown by the following figures. Total number of cattle exported 1910-4, 64,400; in 1915-9, 129,500. In the same periods the number of sheep exported was 450,000 and 648,000 respectively. The export of hide and skins, however, decreased, being 1,928,000 in the five years 1910-4 and 1,552,000 in 1915-9. The very large number of camels exported for the use of the Egyptian Expeditionary Force is not included in the trade returns. Supplies of ivory decreased; 2,792 kantars were exported in 1913 and only 1,105 kantars in 1919. Dates, wood, charcoal, gold and senna were minor exports.

Three-fourths of the total exports go in the first place to Egypt, whence a considerable proportion is re-exported to Europe. Nearly all the rest of the exports go to Arabia, Abyssinia or Entren. Imports consist mainly of textiles and food-stuffs. An indication of the increased purchasing power of the people was the rise in the value of the imports of cotton fabrics, sugar, tea, coffee and spices. Those imports were valued at £E684,000 in 1914 and at £E2,062,000 in 1918. Imports come mainly from Great Britain and Egypt (each about 30%) and India and Aden (about 15%). South Africa (chiefly coal and sugar) and Abyssinia supply most of the other imports.

The following table shows the value of external trade (excluding specie) in the years named—

Year	Imports	Exports (including Re-export)	Total
1910	£E1,348,000	£E 977,000	£E2,325,000
1913	2,109,000	1,278,000	3,387,000
1918	4,024,000	4,210,000	8,234,000
1919	4,805,000	3,004,000	7,814,000

¹ Most of the "Arab" tribes in the Sudan are of Hamitic stock.

² Includes for 1918 Government imports £E988,000, and for 1919 Government imports £E1,804,000.

Irrigation.—The cultivator in the Sudan depended mainly on the rainfall and only to a less extent on the Nile flood and on artificial irrigation. While these conditions continued the area cultivated, in a year of good rains, could not much exceed 2,500,000 feddans, while cultivable land, given irrigation, has been estimated as high as a fourth of the total area of the Sudan. The Sudan Government elaborated schemes for irrigating a small portion of this uncultivated land, namely the Gezira plain and the Tokar area. In addition they embarked in 1909 on a scheme for irrigating an additional 100,000 feddans in the Dongola province by annual flooding on the basin system. In 1917, as an emergency measure to meet war needs, some 19,000 feddans in Berber and Dongola provinces were put under cultivation by means of pump irrigation.

The Gezira scheme was of much importance. The Gezira (=island) is the land lying between the White and Blue Niles. It was originally proposed to irrigate 100,000 feddans. Experiments undertaken in 1911 at Tayiba, near Wad Medani, on the Blue Nile, having proved conclusively that Egyptian cotton of the best quality could be grown commercially in that district, irrigation work was started early in 1914, with funds advanced by the British National Debt Commissioners. The intention then was to raise in London a loan of £3,000,000 to meet the expense of the work, but owing to the World War the scheme had to be held in abeyance. Eventually, in 1919, a loan of £6,000,000 was authorized by the British Parliament, £4,000,000 to be spent on the Gezira works. Meanwhile it had been decided to increase the area to be irrigated to 300,000 feddans. The Gezira scheme provided for the erection of a dam on the Blue Nile at Makwar, near Sennar, so as to raise the river to a level sufficient to feed a great canal excavated across the plain. Work on the canal, the levelling survey and the necessary buildings was continued at a snail's pace (owing to war exigencies) until 1917, when a fresh start was made. In the interval the Egyptian Government had intervened with irrigation projects intended for the benefit of Egypt, and in 1916 investigations were conducted in connexion with the water supply of both the Blue and White Niles. The result was a larger project, for which Sir Murdoch Macdonald, then adviser to the Egyptian Ministry of Public Works, was responsible. In addition to the Gezira scheme it was decided to build a dam across the White Nile at Gebel Aulia about 24 m. south of Khartum, which should be able to hold up nearly double the quantity of water stored by the Aswan dam—this White Nile dam being for the benefit of Egypt. Drawings of the two dams, both engineering works of the first magnitude, were completed in 1917. Cement having been found at a convenient spot near Makwar, a factory was erected there in 1919, and the preliminary work pushed forward on both dams, some of the workmen engaged being brought from the Yemen. Sir William Willrocks, the engineer of the Aswan dam, having very severely criticized the schemes, a Nile Projects Commission, composed of eminent engineers unconnected with the Egyptian or Sudan services, made a thorough investigation during 1920. The commission reported that both schemes were sound and the last obstacle to the building of the dams appeared to be overcome. In 1921, however, the Egyptian Government was compelled, owing to the serious financial situation, to order the discontinuance of work on the Gebel Aulia dam; the Gezira operations were continued but at a greatly reduced rate. Up to June 30 1921 some £E3,264,000 had been spent upon the Gezira schemes. Meanwhile a proposal to increase the Sudan loan to £9,500,000, owing to the increased cost of labour, material and transport, had been rejected. The Tokar area irrigation works, for which only £140,000 was estimated to be needed, were continued.

Communications.—As a corollary to the irrigation schemes at Tokar a railway from that town to the seaport of Suakin was sanctioned in 1919. The distance is about 60 miles. The railway south from Khartum to Sennar and thence, crossing the White Nile at Konti, westward to El Obeid, the capital of Kordofan—a distance of 428 m.—was completed in 1911. It had the immediate effect of stimulating the trade in gum arabic for which Kordofan is famous. Both railways and steamers are State-owned; in 1918 the steamers department, which controlled the whole of the river traffic on the White and Blue Niles and their tributaries south of Khartum, was incorporated with the railways department, which had taken over the administration of the harbour of Port Sudan in 1914. The chief difficulty of the department during 1914-20 was in maintaining regular services efficiently. Great difficulty was experienced in keeping the Bahr el Ghazal free from sudd blocks, which caused much delay to steamers.

The upkeep of existing roads and the building of new roads entailed heavy labour and expense. In the northern and central zones wells had to be dug to make many of the tracks usable; in the south there was superabundance of water and dense forests to be cut through. One of the most important trade roads was that from Rejaf—the southern limit of navigability of the Nile from Khartum—westward to the Belgian Congo border. Good work was done on this road in 1916-8. Eighty streams had to be crossed in 125 m.; a single-span steel bridge 193 ft. long was erected over the river Yei. The difficulty of keeping the roads practicable in the equatorial regions in the long rainy season was great. It was largely on the opening-up of roads, and more roads, that the complete pacification of the southern provinces depended. From 1916 onward experiments

were made in the use of motor tractors and cars on the roads, with at first but moderate success. In 1920 the use of aeroplanes by officials for visiting distant posts was first recorded. This followed the laying-out in 1919 of a number of aerodromes and the passage in Feb. 1920 of aeroplanes engaged in the first Cairo to Cape flight. This flight led to the discovery, from the air, by Dr. Chalmers Mitchell, of the volcanic character of a range of hills in the Bayuda desert (see AFRICA: Exploration).

On the conquest of Darfur the telegraph system was extended to its capital El Fasher. Telephone exchanges are established in the chief towns. The first wireless telegraphic stations were erected in 1915—at Port Sudan, Malakal, Nasser and Gambella, a chain extending from the Red Sea to S.W. Abyssinia. In 1916-8 five other wireless stations were erected, three in Darfur, the others in the far south, at Wau and Mongalla.

Finance.—The subvention in aid of civil expenditure made to the Sudan by the Egyptian Government, which began in 1899 with an allocation of £E.156,000, reached its maximum in 1902 with £E.268,000, after which it was gradually reduced. In 1912 it stood at £E.163,000. In 1913 it ceased to be paid in accordance with an arrangement by which the Egyptian Government credited the Sudan with the amount of the customs collected in Egypt on goods entering and issuing from the Sudan, estimated at £E.85,000. The Egyptian Government, however, continued to defray military expenditure on account of the Sudan, estimated at £E.172,000. The insufficient rains and low floods with other external factors exercised an adverse effect on the economic situation just when the subvention was withdrawn. Nevertheless, the Sudan budgets of 1913-4-5 closed with a slight surplus. The more prosperous conditions which followed eased the situation and allowed an increase of taxation without impairing trade. Revenue, which in 1911 stood at £E.1,664,000, rose in 1919 to £E.2,950,000, with a surplus over expenditure of £E.267,000. The budget for 1920 was balanced at £E.3,500,000. A traders' tax was imposed in 1913, the trading community as a class having up to then paid nothing in direct taxation. In 1919 £E.6% was payable on assessed annual profits exceeding £E.500. In 1917 an excise duty was imposed on sugar, in 1919 the duty on tobacco was raised, heavy increases were made in railway and steamer rates both for goods and passengers. The railway and steamer services yielded a substantial profit (£E.210,000 in 1915, £E.286,000 in 1919). The rise in the price of all commodities was the main cause of the increase in taxation. The surpluses obtained since 1916 were passed to a reserve fund, the only source available, apart from borrowing, for capital expenditure. On Jan. 1 1920 the reserve fund amounted to £E.426,000 only, the "reserve" being almost wholly expended year by year on necessary works.

Education.—The Government schools are all in the northern or Moslem half of the Sudan; the only schools among the pagans in the southern half are those of the missionary societies. In the north there was a considerable increase in the number of boys attending elementary vernacular schools, while the sending of girls to school became more popular with parents. There were in 1919 five elementary girls' schools, besides higher schools for girls managed by missionaries. There was after the war a considerable demand for boys with a technical or industrial education. In 1920 over 400 boys trained in the Gordon College workshops were in employment, as to three-fourths in Government service. (F. R. C.)

Political History.—The political status of the Anglo-Egyptian Sudan remained in 1921 as defined by the treaty between Great Britain and Egypt of Jan. 18 1899. Although the country passed through a period of depression in 1913-5, comparing 1920 with 1910 there was a distinct advance in the well-being and resources of the people. The recovery from the disastrous rule of the Mahdi and Khalifa was shown by the large increase in population. The period 1910-20 was also notable for a marked growth of confidence in the Government. The loyalty of the leading chiefs and notables was never in doubt, and throughout the World War the vast majority of the people remained peaceful and contented. The number of minor operations undertaken both before and after the war were mainly against primitive tribes in the far south and did not affect the more highly developed provinces.

By the annexation of Darfur in 1916 (see below) the area under the control of the Sudan Government was increased to over 1,000,000 sq. miles. This vast region was administered in 1921 by some 110 British officers and officials, assisted by a technical staff. The military establishment included 14,000 men of the Egyptian army, with one British infantry battalion and a detachment of garrison artillery at Khartum. A new unit, the Western Arab Corps, was raised for service in Darfur.

The Lado Enclave (see 16.60) was transferred in 1910 from the Belgian Congo to the Sudan and added to the province of Mongalla. In the same year an outbreak of the old fanatical

spirit had to be suppressed in Sennar, and during 1910-2 minor expeditions dealt with local disturbances in Kordofan and Mongalla. Others were also undertaken in 1914-8 to deal with turbulent elements in the Nuba Mountains—traditionally obnoxious to authority—and to keep order in the equatorial regions, where the Nuer and Dinka tribes gave a good deal of trouble. The most important of these operations was in the Nuba province in 1917-8. After a number of collisions, in which Capt. R. W. Hutton was killed (April 1917), a considerable force was sent in the autumn of that year and after a somewhat arduous campaign the hill tribes were in Feb. 1918 reduced to submission. In 1918 the Sudanese troops aided in operations against the warlike Turkana, a tribe, much given to raiding, living on the Sudan-Uganda border. Unfortunately neither the Sudan nor the Uganda Government had forces to spare to station troops permanently in this remote area.

An incident at Kassala towards the end of 1918 of no political importance is yet noteworthy as illustrative of the sporadic outbursts of fanaticism to which parts of the Sudan were liable. It was thus officially recorded:—

"Without a word of warning and in the dead of night a band of some 40 fanatics, led by a religious lunatic, suddenly rushed the guard and milking picket furnished by the Egyptian unit on the fort and then proceeded to attack the lines of the camel company of the Eastern Arab Corps. No longer aided by the element of surprise, the band suffered heavily in killed and wounded at the hands of the latter unit. The leader was amongst the killed and the few that escaped were ultimately accounted for by the camel company and the police."

Aggressive action by the Aliab section of the Dinkas in Mongalla province led to the despatch of a small force in 1919 under Maj. R. F. White, which was accompanied by the governor, Maj. C. H. Stigand. An attack by spearmen in the long grass led to the death (Dec. 8 1919) of these two valuable officers and other casualties, entailing a punitive expedition in the following year.

The completion of the railway from Khartum to El Obeid, the capital of Kordofan, in 1911 enabled the Government better to control Darfur, where 'Ali Dinar ruled as a Sultan tributary to the Sudan; and, after the French occupation of Wadai, negotiations were in 1912 opened with France for the determination of boundaries by the inspector-general, Sir Rudolf von Slatin, on behalf of Great Britain and Egypt.

In Jan. 1912 King George and Queen Mary paid a visit to Port Sudan on their return journey from India, and a review was held at Sinkat by the King, at which representatives from almost every section of the Sudan were present. The scanty rainfall and abnormally low Nile of 1913 caused famine conditions in portions of Dongola and the Blue and White Nile provinces. Relief measures and the importation of large quantities of millet from India made a most beneficial impression on the populations affected. In April 1914 an exchange of certain districts on the Upper Nile was effected, in the interests of both administrations, with the Uganda Protectorate (see UGANDA).

On the outbreak of war with Turkey in Nov. 1914 the various provinces of the Sudan, notwithstanding the Moslem character of the majority, displayed perfect loyalty to the administration. In Darfur, on the other hand, the Sultan 'Ali Dinar renounced his allegiance, and, instigated by Turkish emissaries working through the Senussi sect, contemplated an invasion of the Sudan. His communications with the Senussites were cut off by posts of irregulars, and early in 1916, military operations were undertaken which led to the defeat and subsequent death of 'Ali Dinar (for the military operations, see SENUSSI). Darfur was thereafter administered as a province, and an Anglo-French convention, signed at Paris on Sept. 8 1919, at length settled the common frontier of Darfur and Wadai. The occupation of Darfur was followed by an expedition in co-operation with the French in the region north of Darfur against marauders of the Guraan tribe, who had given considerable trouble to both administrations. A garrison for Northern Uganda, whence troops had been withdrawn to meet the menace from German East Africa, was for a brief period provided by the Sudan Govern-

ment Except in Darfur, the war did not, externally, touch the Sudan at any point, and its administration continued on normal lines. The Prince of Wales visited the Sudan in 1916 and the Duke of Connaught in the following year.

The disturbances which broke out in Egypt in 1919 interrupted direct communications with Cairo, and the temporary cessation of Nile traffic caused a certain loss of trade. The Sudanese populations were not concerned with the aspirations of Egyptian nationalism, and the large Egyptian official community, while by no means indifferent to the development of events in their own country, did not actively display sympathy, so that this period of crisis passed without incident. Nor did the Armistice and the negotiations which followed the victory of the Allies occasion special comments. A delegation of Sudanese notables proceeded to England to offer congratulations on the successful termination of the war and returned with pleasant impressions of their visit. The only remaining centre of unrest in 1921 was the Abyssinian border, where raids and hunting parties of chiefs, nominally but not effectively under Abyssinian control, continued to give difficulty.

The outstanding event in Sudanese history during the war period was the withdrawal of Sir Reginald Wingate from the governor-generalship, on his being called to Cairo in Dec. 1916 as high commissioner for Egypt. He succeeded Lord Kitchener as Sirdar of the Egyptian army and governor-general in Dec. 1899, after an almost continuous service with the Egyptian army since 1883. Under his able and sympathetic administration the Sudan had emerged from the chaotic condition to which Mahdist misrule had reduced it, and gradually developed into a peaceful and contented country. His name will long be remembered by the people to whose regeneration he devoted the best years of his life. Another historic association with the Sudan was terminated by the outbreak of war between Great Britain and Austria-Hungary, when Sir Rudolf von Slatin, the inspector-general, whose advice in all native affairs had been most valuable, was inevitably compelled to resign. Mention may also be made of the resignation of Sir Edgar Bonham-Carter in 1917 after 18 years' service. He had been responsible for the creation and development of the whole legal and judicial system of the Sudan.

Col. (afterwards Maj.-Gen. Sir) Lee Stack, civil secretary to the Sudan Government, succeeded Sir Reginald Wingate as governor-general and sirdar; Slatin Pasha's post was not filled.

See the Annual Reports on the finances, administration, etc., of the Sudan, issued annually in London up to 1913, and the Report for 1914-9, issued 1920, which is of special value. The *Sudan Almanac and Handbook to the Sudan* are also official publications. Murray's *Guide to Egypt and the Sudan*, and Macmillan's, Baedeker's and Lock's guide-books may be used with profit. See also Y. P. Artin, *England in the Sudan* (1911); and *Sudan Notes and Records*, an excellent serial publication begun in 1918. The Survey Department, Khartum, issues a map of the Sudan, in many sheets, on the scale of 1:250,000. (J. R. R.)

SUDERMANN, HERMANN (1857-), German dramatist and novelist (see 26 20). His novels include *Das hohe Lied* (1900); and *Litauische Geschichten* (1917); while in 1911 appeared a volume of short stories, *Die indische Lilie*. His later plays include *Strandkinder* (1910); *Der Bettler von Syrakus* (1911); *Der gute Ruf* (1913); *Die Lohgesänge des Claudian* (1914), and *Das Höhere Leben* (1919).

SUESS, EDUARD (1831-1914), Austrian geologist (see 26 21), died at Vienna, April 25 1914.

SUEZ CANAL (see 26 22).—The five years 1909-13 witnessed a considerable increase in the traffic passing through the canal. The World War greatly restricted the use, particularly in 1917.

In the following table the figure for receipts is obtained by taking 25 francs as equal to £1 sterling except for 1920, when the rate is reckoned at 50 francs to the £1.—

	No. of vessels	No. of passengers	Net tonnage	Gross receipts
1909	4,239	213,122	15,407,527	£4,782,724
1913	5,085	282,235	20,033,834	£5,140,403
1917	2,353	142,313	8,368,918	£2,880,761
1920	4,009	500,147 ¹	17,574,657	£5,329,213

¹ This abnormal increase was due to the movement of troops.

In Feb. 1915 the Turks, who had traversed the Sinai peninsula, attacked the Suez Canal at various points, and it was not until after the battle of Romani in Aug. 1916 that all danger to the canal was ended. Throughout this period traffic was interrupted on two occasions only, and then for very brief periods. During the World War, under Adml. Robinson as Director-General of the Egyptian Ports and Lights Administration, 1,239 transports and men-of-war, totalling over 8,000,000 tons, were passed in safety through the canal, and 965 transports, 43 hospital ships, 36 store ships and 307 colliers were dealt with at Port Said.

Striking differences in the pre-war and post-war shipping were the elimination temporarily after 1914 of German vessels (which in 1911 had 13.4% of the tonnage) and the increasing number of Japanese and United States ships using the canal. Japanese vessels represented before the war 1.7% of the tonnage; in 1920 their tonnage had increased to 9.1%. United States vessels, rarely seen in the canal before the war, in 1920 represented 4.1% of the tonnage. British ships continued to provide the bulk of the tonnage, the proportion in 1920 being 61.7% compared with 62.2% in 1911. In 1920 three passages were made by steamers of over 23,000 tons gross, a figure never before reached, and one vessel had a length of 669 ft., the longest registered in the canal. The quantity of goods passing through the canal in 1920 was 34% below the figures of 1913. There had been some change in the character of the merchandise, food-stuffs diminishing sensibly in volume, though corn from Manchuria and China made its appearance. Imports of coal from S. Africa and Australia were particularly marked in 1919 and 1920.

A scheme to extend the concession of the Suez Canal Co.—the existing concession does not expire until 1968—was rejected by the Egyptian General Assembly in 1910, not on its merits but in an effort to discredit the British administration. The Suez Canal Co. cooperated heartily with the British authorities in Egypt during the war. To meet the increased costs caused by the war the Company in 1916 and 1917 imposed higher tariff charges, which, after the war, acted in restraint of traffic and were not of permanent benefit to the Company. In 1910 the Company asked to have put into operation at Port Said the free zone regime provided for in an agreement made in 1902 between it and the Egyptian Government. It held that the transit trade would be stimulated if an area were set apart in which goods could be handled, or remain, uncontrolled by the customs. An agreement on the subject was drawn up in 1920.

It is noteworthy that in 1919, and to a much more marked extent in 1920, the Company benefited by the decreased value of the franc. This was made possible as shipping dues were collected in Egypt and were paid in money less depreciated than the franc, and profits earned in Egypt were used in the purchase of francs at current rates. In 1920 the benefit from these operations amounted to 101,772,000 francs, or over £2,000,000 at average rates of exchange.

The annual reports of the Suez Canal Co., published in Paris, give full statistical information. (F. R. C.)

SUGAR (see 26 32).—In the year 1910-1 the world's production of sugar amounted to 16,951,000 tons, of which 8,391,000 tons were produced from cane and 8,560,000 tons from beet, including that grown in America. For 1913-4 the world's total production reached 18,486,000 tons, of which the cane production was 9,577,000 tons—an increase of 1,186,000 tons of cane. The beet crop for the same period was 8,909,000 tons, of which 655,000 tons were grown in America—an increase of 340,000 tons. These were the highest figures reached during the decade 1910-20, for after the outbreak of the World War in 1914 the European production declined yearly, until in 1919-20 the world's beet crop reached only a little over 3,200,000 tons, of which 653,000 tons were American. The world's crop of sugar for 1920-1 was estimated at about 16,475,000 tons, of which cane was estimated to produce over 11,828,000 tons, and beet 4,647,000 tons, of which 935,000 tons were American.

Owing to the British Government recognizing at once the importance of securing to the nation a supply of sugar sufficient for the wants of the people, sugar was the first commodity to be controlled in the United Kingdom during the war (see FOOD SUPPLY), and within a few days of its outbreak the Government had bought several thousand tons of sugar. In Aug. 1914 a Royal Commission on the Sugar Supply was formed. It took over the duties of buying and selling sugar. These operations were done through the ordinary channels of trade, and everyone was guaranteed a

supply on the basis of his trade before the war, the actual quantities being fixed from time to time in proportion to the sugar held by the Government; and it is not too much to say that the sugar control was the most successful of the many Government controls.

It may be noted that in the Final Report of the Commission issued in June 1921 it was stated that, "The wisdom of the Government in at once taking over in 1914 responsibility for the sugar supply was, in our opinion, fully proved in the sequel. But while we recognize that in the special circumstances State management was a necessity, our experience does not lead us to think that State control is a desirable thing in itself in the region of trade in commodities."

The total consumption of sugar sold under control was approximately as follows.—

	Tons
1915	1,818,488
1916	1,314,910
1917	1,219,761
1918	1,109,905
1919	1,595,004
1920	952,408

The stocks held by the Commission on March 31 1921 were 390,479 tons of raw and 57,787 tons of white.

The Commission had desired to carry out their operations free of cost to the Exchequer. "This aspiration cannot now be realized," they add, "but the fault is not ours. From time to time since the middle of 1919 the Commission has on various occasions pleaded for an increase in the selling prices of its sugars, so as to build up a reserve to meet the loss which it foresaw as probable on the liquidation of its stocks on the conclusion of its operations. But on no occasion has a rise been authorized until weeks or months after it was recommended, and then not always to the extent recommended."

"From a calculation we have made we are able to say that if our recommendations (which were always kept as low as possible in view of the reluctance shown by the Cabinet to an increase in prices) had been approved at the time they were made our receipts would have been £16,000,000 more than they have been in fact. Even that sum is less than the deficit which it is probable that the Exchequer will have to meet on our operations, and which we estimate at not less than £24,500,000. Some may perhaps hold that it is not of material importance to the public whether it has to bear a burden of this kind in its capacity as a taxpayer or in that of a consumer of sugar. But to us it is a matter of regret that we shall not be able to claim that we discharged the duties imposed upon us without having recourse to the funds of the Exchequer otherwise than for the purpose of the temporary financing of our operations. The advances made to us under this latter head by the Treasury stood on March 31 at £27,281,937."

The cost of the establishment of the Commission from 1914 to 1921 is given as £103,239.

The year 1920 stands out as having the most violent fluctuations the sugar trade has probably ever experienced. The British Royal Commission on the Sugar Supply and the American Equalization Board acted conjointly in 1919, and by their actions controlled both the American and European markets. Prices were kept between 30s. and 63s. per cwt. for Java 96° F.L., but there was some hesitation in the autumn with regard to the continuation of the operations of the American Equalization Board, which did not decide on further action until December. In the meantime a good deal of the Cuban crop had been sold to Europe and the East on a basis of 6½c. per lb., and when the American Equalization Board decided to continue control it was too late to secure the Cuban crop. The planters, having sold a certain quantity of sugar, were independent, and prices were forced up to 12c. (equal to 76s. 9d. per cwt.) at the end of January. In Feb. there were, however, large offerings on the part of the Cuban planters, owing to supplies of sugar coming into the market, and quotations declined to 9c. (equal to 59s. 3d. per cwt.) In March the American refiners began to buy freely, and this increased demand was intensified by two serious reductions in the estimate of the Cuban crop. Wild speculations took place, and in May as much as 23½c. (equal to 136s. per cwt.) was paid. Large purchases were also made in Jan. and May of Manila sugar for shipment during the summer months. The effect of these inflated prices brought its own remedy; consumption decreased rapidly both in England and in America, and by the end of July Cuban prices had fallen to 16c. which was equal to a fall of 40s. per cwt. This fall continued until, at the end of the year, Cuban sugar was actually sold at 3½c. per lb., or equal to a total fall from the highest point of over 110s. per cwt. The result of these heavy fluctuations caused a financial crisis in the trade. Enormous losses were suffered by the American and Canadian refiners, who had bought and sold heavily for the autumn months, and these forward sale contracts were largely repudiated when the time came for delivery. The British refiners, being still under control, escaped these violent losses.

The values of refined sugar in 1910 varied from 17s. 3d. to 23s. 6d. per cwt. for Tate's cubes, and in 1911—the year of exceptional

drought—prices continued to advance to 27s. 6d., but towards the end of 1912 prices declined to 19s. 3d. and with slight fluctuations prices were further reduced at the outbreak of war to 17s. 9d. There was then a steady rise, and in 1914 cubes were sold at 35s., and granulated at 30s. per cwt.; in 1915 cubes were 50s. and granulated 33s., and then by gradual stages till, for domestic consumption, cubes in 1920 reached 116s. and granulated 112s., but, under the voucher system which was in vogue during control, the prices of sugar for manufacturing purposes were from 160s. to 164s. per cwt. Refined sugar produced by the British refineries from 1910 till the outbreak of war averaged about 45% of the total consumption, but after the war the production was about 74%. The British duty from 1910 till 1914 was 1s. 10d. per cwt., in 1915 9s. 4d. per cwt., in 1916 14s. per cwt., and in 1918 it was increased to 25s. 8d. per cwt., at which it remained in 1921. This was out of all proportion to the value of the sugar, and naturally checked consumption.

In 1913 the British Government withdrew from the Brussels Convention, which had been adopted in 1903, after many years' endeavour on the part of Great Britain to counteract the effect of the system of continental bounties on beet sugar. The adoption of the Convention had undoubtedly saved the British West Indian sugar trade from extinction, and British sugar refiners were able to compete on more equal terms. At the same time there was still strong opposition in England from the Free Trade party, who were anxious to have sugar at any price, whatever injustice might be inflicted on the British colonies and the home refiners. In 1912 there was a serious falling off in the European beet crop, and there was a large deficiency in the world's supply, so that an inevitable rise in price took place. Russia, however, had large stocks on hand, which, under the Convention, could not be imported into England owing to the fact that prohibition was in force instead of countervailing duties. Had there been countervailing duties the sugar would have been shipped to England and the difference in duty paid. Giving way to pressure from those who were anxious to get cheap sugar irrespective of the reason for the cheapness, Mr. Asquith's Liberal Government gave notice in Aug. 1912 to withdraw from the Convention. The curious feature was that, as the result of this notice, Russia was permitted to send a considerable quantity in excess of the limit laid down by the Convention, but the quantity she sent had very little effect in making up the shortage of about 1,700,000 tons of the world's production.

In 1919 Mr. Lloyd George's Government (with Mr. Chamberlain as Chancellor of the Exchequer) took a further step in accordance with the views of the British West Indian planters, and agreed to give preferential treatment to sugar produced within the British Empire, in the form of a reduction in its case of one-sixth off the import duty on sugar. The British preferential duty on raw sugar at 96° polarization is equal to a preference of about 3s. 9d. per cwt., and on white sugar of a polarization over 98° 4s. 3 3/4d. It was too soon in 1921 to know what permanent effect this concession would have upon the production of sugar in the British colonies, but it was hoped that it would enable their planters to compete with Cuba and other countries where costs are considerably less, and consequently secure a larger share of the sugar trade of the United Kingdom.

Since 1910 serious attempts have been made to grow beetroots in England for the manufacture of sugar. A factory was erected in 1911 in Cantley, in Norfolk, but was worked only one season, and was closed during the war. It was purchased by a private Liverpool firm in 1920. A fair quantity of beetroots was grown in the immediate neighbourhood, but the high price which was given for the roots made it impossible for the purchaser to make a profit on the sugar produced. As a matter of fact a loss of from £60,000 to £70,000 was incurred. A further and more ambitious attempt was in 1921 being made at Kelham, Notts, where a large factory was erected, considerable quantities of beets having been planted in the neighbourhood. The British Government not only subscribed £250,000 of the capital, but also guaranteed interest on the amount of public capital raised at 5% for 10 years, and took £125,000 of second debentures. See also FOOD SUPPLY AND RATIONING. (L. A. M.)

SUKHOMLINOV, VLADIMIR (1848-), Russian general and war minister, was born in 1848. He passed through the cavalry school in St. Petersburg, and in 1867 was given a commission in the Guard Ulans. He graduated from the Academy of the General Staff in 1874. He took part in the war with Turkey in 1877-8 as an officer of the general staff, and was awarded the St. George Cross of the fourth degree. From 1884 to 1886

he commanded a dragoon regiment and from 1886 to 1897 he was the head of the officers' cavalry school in St. Petersburg, having meantime in 1890 been promoted to the rank of general. His next appointment was as commander of the 10th Cavalry Division. In 1899, while commanding the troops of the Kiev military district, Gen. Dragomirov appointed him as his chief-of-staff and later as his assistant. His close connexion with Gen. Dragomirov, who enjoyed enormous prestige in the Russian army, ensured Sukhomlinov's future career. After the death of Dragomirov, he was appointed commander in Kiev.

From 1900 to 1916 he was Russian war minister, and it was under him that two Russian orders for mobilization were given at the outbreak of the World War. Self-confident and ambitious Sukhomlinov played a disastrous rôle in the administration of the Russian army. Notwithstanding the discovery, even in Oct. 1914, that there was an insufficiency of shells, rifles and cartridges, he assured the Duma that everything was all right. It was only in 1916, under strong pressure of public opinion, that the Tsar Nicholas II dismissed him from office. Finally he was brought up for trial on a charge of treason. The court found him guilty of offences in office, and he was sentenced to penal servitude. Later Sukhomlinov was freed by an amnesty granted by the Bolsheviks and went to Finland. In 1921 he began the publication of his memoirs. (N. N. G.)

SUN YAT-SEN (1867–), Chinese leader of the revolutionary movement which ended in the abdication of the Manchu dynasty in Feb. 1912, was born in Kuangtung province, the son of a native Christian. He studied at the College of Medicine in Hong-Kong from 1887 to 1892, and there took his degree in medicine and surgery. He practised his profession first at Macao and then at Canton, but from the outset of his career displayed more interest in politics than in medicine, being by temperament an iconoclast, an organizer of secret societies and a leader of conspiracies against the established order of things. Inspired by his semi-European training, with bitter resentment against the Manchus, whom he regarded as responsible for China's humiliation at the hands of Japan, he first raised the standard of rebellion and of Cantonese independence in 1895; but the *coup* failed and Dr. Sun was compelled to seek safety in exile. Henceforward all his energies were directed towards stimulating the anti-dynastic movement, first by the collection of funds from the Chinese communities in the United States, Hawaii and the Straits Settlements, and then by organized propaganda work conducted by secret agents throughout the Empire. He received considerable assistance and encouragement in Japan, where he founded a society known as the Tung Men-hui, which played a prominent part in Chinese politics after the establishment of the Republic. Although an exile, he was generally regarded by the "Western-learning" section of Young China as its leader, especially after the Chinese Government's attempt to kidnap him in London, in 1896. In 1911, when the revolution broke out prematurely at Wuchang, Dr. Sun was in England; but he hurried back to China and arrived at Shanghai on Christmas Eve, in time to be acclaimed as the originator of the Republican programme and elected Provisional President by the delegates to the National Convention assembled at Nanking. On Jan. 5, after having taken the oath of office, he issued a Manifesto (countersigned by Wu Ting-fang as Minister for Foreign Affairs) in which the purposes and policy of the Republican Government were proclaimed. On Feb. 12 an Imperial edict announced the abdication of the Emperor; it surrendered the reins of government to the representatives of the sovereign people and declared that henceforth the constitution should be Republican; at the same time, the organization of the new form of government was entrusted, "with full powers," to Yuan Shih-k'ai. On the 14th, Sun Yat-sen resigned the Presidency and in the name of the Nanking Assembly invited Yuan to accept the position of Provisional President. His action was applauded by Young China at the time as evidence of patriotic self-abnegation, but events proved that it was chiefly inspired by recognition of the fact that he and the Cantonese group of politicians who had joined him as leaders of the Republican movement, did not

yet carry sufficient weight to justify them in attempting to form a national government.

Relations between Sun Yat-sen and Yuan Shih-k'ai were never cordial, but until the ejection from Peking of the Kuo Min-tang Radicals by the President Dictator in 1913, they preserved the appearance of goodwill, and towards the end of 1912 Sun accepted a highly paid appointment as Director of National Railways at Shanghai. After the failure of the Kuo Min-tang's "war to punish Yuan," Sun wandered again in a wilderness of conspiracies. Eventually, after the death of the Dictator (1916) he became one of the Cantonese group of politicians which waged continual warfare against the party in power at Peking. Because of the futility and sordid intrigues which characterized the independent Military Government at Canton, he, whose reputation in 1912 had stood high at home and abroad, came gradually to be regarded as an irreconcilable conspirator, whose personal ambitions were largely responsible for the continuance of the senseless civil strife between the North and the South. By the vehemence of his rhetoric, by the fervour of his grandiose schemes for the remaking of China at the time of the revolution, he captured the imagination of considerable sections of the public, especially in the United States; but his subsequent career failed to justify his own belief in himself as a heaven-sent reformer. In April 1921, a special session of the Southern (Canton) Parliament elected him to be President of the Chinese Republic, his supporters declaring the Canton "Military Government" to be the only lawfully constituted government in the country; but the influence of these Cantonese "Constitutionalists" over the other southern provinces had then become almost insignificant, and the "Military Government," prohibited by the Foreign Powers from interfering with the revenues of the Maritime Customs, was confronted by financial problems of a kind which threatened not only its reforming activities but its continued existence.

SUPAN, ALEXANDER GEORG (1847–1920), Austrian geographer, was born at Innichen, South Tirol, March 3 1847. He was educated at the Laibach gymnasium, and in 1870 took his doctor's degree at Graz, afterwards becoming a teacher in the Oberrealschule at Laibach. In 1872 he left Laibach and studied geography at Vienna, Dresden and Halle, returning in 1877. In 1881 he was appointed professor of geography at the university of Czernowitz, and in 1884 became editor of *Petermanns Mitteilungen*, retaining this post until 1909, when he accepted the chair of geography at Breslau. Under Supan's editorship *Petermanns Mitteilungen* was more concerned with reports and accounts of geographical work in every sphere than with original papers and records of discovery, and a feature in which the editor was much interested was the publication of supplements to the *Mitteilungen*. An account of the economic produce of N. America, 1880–5, appeared in this manner in 1886, and *Die Bevölkerung der Erde*, founded 1872 by Hermann Wagner and Behm, was continued by Supan as a supplement from 1890 to 1910. In 1889 he became editor of the statistical calendar of the *Almanach de Gotha*. His original contributions to geographical science are chiefly concerned with climatology and oceanography, and his published works include *Lehrbuch der Geographie* (1873); *Statistik der unteren Luftströmungen* (1881); *Grundzüge der physischen Erdkunde* (1884), *Deutsche Schulgeographie* (1895, latest ed. 1915) and *Die territorialische Entwicklung der europäischen Kolonien* (1906), besides many papers in *Petermanns Mitteilungen*. He died at Breslau July 6 1920.

SUPPLY AND TRANSPORT, MILITARY (see 26.113).—During the World War, the administrative services—i.e. the management of transport, supply, welfare and salvage—became of vastly increasing importance. The struggle was between groups of nations bending to the task of war the whole of the resources of a highly complex scientific civilization, and using in its prosecution every material and moral factor at their command. Some note of the working of the administrative machinery (especially at the culminating point of the struggle) is necessary to give a true picture of the war. Attention will be given here in the main to the British organization in 1918—with illustrative references

to other armies and to prior dates. For the feeding of the British army, see FOOD SUPPLY.

When the armies first took the field in 1914, Germany was at a clear advantage in administration. That was to have been expected. It was her war, and she had prepared for it with meticulous care. The equipment of the German soldiers comprised several novel ideas for greater comfort and efficiency. Examining some of the German dead who had fallen in the early reconnaissance affairs in front of Tirmont on Aug. 14, the writer had the first uneasiness that Germany might win, so strong was the evidence their equipment gave of a patient and thoughtful preparation. The impressive sweep of the German host through Belgium showed, too, that the German railway organization was superb, and the way the guns kept up proved that there had been a clear thinking out in advance of the new problems of ammunition-supply which the free use of heavy artillery as field pieces had brought to the fore. German staff documents published since the war by Gen. Ludendorff indicate that these matters of administration had been studied from 1910 onwards and that the German staff were confident that their inferiority in numbers would be compensated by a superior organization in supply. The French administrative services in 1914 appeared much weaker if examination were confined to plans and *matériel*. The troops were not as well provided for, the transport organization not so well planned. But if the human factor were taken into consideration much of the handicap was made up. The French showed a genius for improvisation on the actual battle field, and an astonishing faculty for "getting there" with inferior means. Their food scales for man and beast (to give an example) spelt scarcity in German or in English eyes; but they sufficed. In the battle the French soldier was never inferior in energy and endurance, and the French transport was generally up to time. The national *elan* overcame material deficiencies; and a genius for quick improvisation showed constantly, never more dramatically than in the mobilization of Gen. Gallieni's "Taxi-cab Army" which moved out to the defence of the capital at a critical juncture. The British administrative services in 1914 were lavish both of supplies and transport. But the British force was a small one, and though its scale of transport was extravagant compared with the French, the total was only 250 motor cars, 950 motor lorries and 40,000 horses. With railway transport it then had no concern; the French managed its railway transport. Indeed the British force in France in 1914 did not completely "administer" its own affairs. Though it was a distinct army in command it was dependent on the French organization for essential services of transport.

The Trench War.—A long period of trench warfare followed the battle of the Marne, and the administrative systems of the three armies were adapted to new conditions, the chief of which were an enormous increase of ammunition expenditure, the introduction of poison-gas as a weapon, calling for entirely new supplies of offensive and defensive material, and a simplification of the problems of transport, which in a stabilized warfare could follow almost a civilian routine, disturbed only by the chances of shell fire. The trench war was, of course, punctuated by heavy attacks on both sides, but the shift of ground was never great. Administration, whilst it had to cope with the enormous progressive increase in the scale and variety of supplies per division, was thus given ample time as a rule to increase its transport facilities. It could add to its broad-gauge railway tracks, supplement them by light railways and tramways as well as by motor-roads, and develop the canal systems as useful adjuncts.

In this period of trench warfare the Germans suffered from a steady deterioration as compared with the French and the British. The war had become a contest of *matériel* in which Germany could not keep up. The French were able to develop their supply on more generous lines with the help of British and American resources. The British transformed their system completely. The nation took the view that "money was no object" in securing for the troops the best possible chance of victory and the best possible comfort in the trenches. The

growth of supplies (and therefore in transport) was almost incredible. The British force in 1914-5 suffered from a shell and gun shortage as compared with its enemy, because it had been trained and equipped for a different type of warfare. It had very little H.E. shell, and what it had was not really "high explosive" owing to poor fuzes. The patient search for a "fool-proof" fuze had been so successful that what little H.E. shell they had spluttered off rather than shattered off. The production of high explosive in 1914 was almost negligible. The whole year's supply would not keep the guns of 1918 going for a day. In 1915 Britain began to produce high explosive on a large scale. In 1916 she had increased the 1915 amount sevenfold. In 1917 she had increased that 1916 amount fourfold. From March 1915 to March 1917 the increase was twenty-eight fold. With the increase in the production of high explosive went a corresponding increase in big guns and in field pieces. The expenditure of ammunition in time reached to huge figures. The following are the biggest day records in tons:—July 1 1916 (Somme) 12,776; April 9 1917 (Vimy) 24,706; June 3 1917 (Arras) 17,162; June 7 1917 (Messines) 20,638; July 31 1917 (Ypres) 22,193; Sept. 20 and 21 1917 (Polygon Wood) 42,156; Aug. 8 and 9 1918 (general attack) 15,508 and 23,706. Ordinarily the British depots in France kept a reserve of 258,000 tons of ammunition, and the issues in a normal month ran to about that figure, though it varied a good deal month by month. Thus the average daily expenditure during the last months of 1918 was:—May, 5,478 tons; June, 4,748 tons; July, 5,683 tons; Aug., 9,046 tons; Sept., 8,576 tons; Oct., 4,748 tons; Nov., 3,158 tons. (See also MUNITIONS.)

Gas Warfare.—The introduction of poison-gas was, after the growth of ammunition expenditure, the chief factor in the increase of supply. It was constantly presenting new problems for the administrative services. At first British and French work was solely defensive—the provision of masks, the wearing of which would give immunity, the detection of new gases so as to provide new means of defence. But in time the Allies took the gas offensive, and then their gases were more potent and more plentiful than the enemy's, and for lack of material he could not give his men perfect gas protectors. The last form of gas warfare was the introduction of mustard-gas, a powerful corrosive discharged from shells, which infected the ground on which it fell for many hours. The use of mustard-gas by the enemy raised many problems of supply. The disinfection of contaminated ground with chloride of lime, a prompt change of clothing and bath treatment for men affected, proved efficacious in dealing with mustard-gas. There was, too, safety in protective overalls of oilskin. Mustard-gas affected the veterinary service heavily, there being many casualties to horses and mules through passing over ground infected with the gas.

Big-gun ammunition and gas-warfare munitions were, however, only two items of supply. Rifle and machine-gun ammunition, food for man and beast, trench stores, engineering stores, were other items, all of which had a tendency to grow. In the total during a spell of intense fighting, the British administrative services would carry up to the battle-line 1,934 tons of supplies of all kinds per day per mile of front. The intense battle-front might stretch over 10 miles or more, calling for some 20,000 tons of munitions, food and equipment per day for that 10 miles, much of it passing through furious shell fire before reaching its objective.

The French administrative services never reached the same scale of supply as the British. They expended less ammunition, issued a ration of less weight to man and beast, and dispensed with much of the "comforts" equipment of the British force. But in facing such a German effort as the Verdun attacks of 1916 they had a tremendous problem of transport, which was met by a motor lorry mobilization, the success of which was one of the great feats of the war.

British System Reorganized.—From 1914 up to the date of the first battle of the Somme (July 1916) the British administrative services had had no very severe test (unless the battle of Loos could be so counted, and the organization then was not good).

But by the middle of 1916 the British force in France considered itself completely organized. In munitions it was better supplied than any other force in the field. It had taken over control of its own railway services, supplementing the French broad-gauge railway system, which it had taken over and increased, it had a system of light railways and a greatly increased scale of motor transport. But the Somme battle showed many serious weaknesses. Supply had been increased beyond the scale that transport could cope with. There followed in Nov. 1916 a reorganization of the system. One feature of this organization was good. The division of authority, which put the administrative services under two heads, one for the battle area and one for lines of communication, was done away with. The military railways, which had been hitherto starved, were reorganized, and were generously supplied with staff and material. But what proved in the result to be a mistake in organization was made: railways were separated from the control of the quartermaster-general (who kept control of other forms of transport), and put under an independent directorate of transportation. Thus the commander-in-chief had two separate transport authorities to deal with.

There followed after the battle of the Somme a period when the line was practically stable for a long period, and whilst the almost stationary trench warfare continued, the weakness of this division of authority, and the mistake of allowing any but the military idea to rule in an essential part of the army organization, were not apparent. When the Germans attacked in the spring of 1918 those errors showed very clearly, and the railways had to be brought again under the control of the quartermaster-general, after an interval during which they were under a committee of the staff. But the transport situation then was very critical. The German advance had brought the British front lateral line—St. Just—Amiens—St. Pol—Hazebrouck—under shell-fire at many points. The Germans, whose strategy under Gen. Ludendorff was dominated largely by transport considerations, sought to paralyze completely the whole railway system by continuous air-attack on the British rear lateral—Eu—Abbeville—Etaples,—especially at the points where it crossed the rivers Canche and Somme. Whole-hearted work in building “avoiding” lines and bridges, and the efforts of the motor transport, just kept the position in hand until a British advance in front of Amiens relieved the front lateral. It was a happy circumstance that a new quartermaster-general of the British army in France, Lt.-Gen. Sir Travers Clarke, had just brought to completion the building up of a G.H.Q. reserve of motor lorries. He thought in the winter of 1917-8 that the battle of Passchendaele had exposed a weakness in light railways—that they had to work along defined tracks which could be intensively shelled by the enemy. The British army therefore decided to trust more to the motor transport. There was effected a complete reorganization of it, with the central idea of doing away as far as possible with the “earmarking” of motor vehicles for particular units or particular tasks, and making its total strength completely mobile and liquid. Vehicles saved by this “pooling” were formed into a G.H.Q. Motor Reserve. This proved of great strategic benefit in the spring of 1918. The G.H.Q. Motor Reserve was able then to take up part of the traffic load, and was largely responsible for saving the situation. There were lorry drivers who held the wheel for 36 hours at a stretch, and were lifted from their seats fainting or asleep, a few—who carried on until no longer able to see through their bloodshot eyes—ran their cars into trees or walls or ditches. There were many casualties, but the situation was saved at a time when the railways could not meet the work of supply.

Passchendaele, terrible ordeal as it was for the British army, gave valuable hints as to the proper place of light railways in an administrative system. Light railways at one stage of the war were perhaps over-estimated. There was an inclination to regard them as all-sufficing. The British administrative services ultimately gave them their proper rôle, recognizing that they were most valuable when the line of battle was stabilized for some length of time, but tended to be less valuable as the war

became one of movement. In the spring of 1918, the British army had 920 m. of light railways in operation, in the summer 100 m. less. Its great advance was planned on the principle of concentrating labour upon pushing forward the broad-gauge railways and the roads forward from them, trusting to motor transport and to horse transport to carry on the load from broad-gauge railhead. Earlier in 1918 controversy on the subject was keen, and the French were inclined to take a differing view. The Germans, of course, were tied to light railways, for they had not the means to extend their motor traction. The position on Nov. 11 1918 seemed to justify the British view.

By the summer of 1918 the British administrative services were so confident of their machine that they were supporting strongly in favour of trying for a “knock-out blow” as against the alternative plan of devoting the winter to final preparation for an overwhelming campaign in the spring of 1919. “Administration” covered at this stage a wide scope. It arranged the supply, from England, and from its own workshops and local civilian workshops, of all the varied equipment of the forces, from a tank and a 15-in. howitzer to a tin of dubbin. There came to the ports of France every month for the B.E.F. about 800,000 tons of material. The men to be fed totalled over 2,000,000 and the animals about 500,000. The transport system in addition to half-a-million horses and mules, had about 20,000 motor lorries running over 9,000,000 motor miles per month, it carried on its light railways about 544,000 tons a month, and ran every day 250 trains on its broad-gauge lines. It was constantly building new railways and new roads, and developing new harbour facilities. It ran canal and sea barge services, forestry and agricultural services, and repair shops, on a gigantic scale. It supplied the medical stores for wounded and sick, the veterinary services, the laboratories for the defence of men and animals against poison-gas and for the gas counter-offensive. In the last year of the war it produced timber from French forests for four-fifths of its total needs. It grew vegetables and other food and fodder stuffs, and helped as tiller and harvester in the French fields (in 1918 it saved the crops on 18,000 acres, harvesting at night, the soldiers having to work sometimes in gas masks). It was its tailor, bootmaker, laundryman and even ragpicker. The soldier on going out of the line had clean underwear waiting for him at his divisional baths; his soiled garments were disinfected, cleaned and repaired for reissue, his socks darned, buttons replaced, rents patched, and the garment beyond repair was shipped away as rags for the shoddy mills of Dewsbury.

This administrative army was caterer for men and horses. The civilian world throughout Europe might be suffering from scarcity of food supplies, but to the very last the British soldiers and horses enjoyed good rations. This was only made possible by an organization that eliminated every form of waste.

As banker this administration dealt with every currency and note-issue of the world. It had savings banks and an investment organization for British troops, and even special savings banks for the Chinese. It insured its civilian labourers against death and accident, it negotiated the payment of *octroi* to towns where its troops were stationed, and paid compensation of French property owners for the leases of their lands and buildings and the war damage to their property.

The Complexity of Administration.—This wide range of activities, though it had to be carried on under conditions which varied from day to day, fell with minor variations into three main categories. (1) *Maintaining a stabilised position.* This was comparatively easy. The traffic demand was known. Wastage of horses and material could be calculated with some certainty and replaced by a routine process. (2) *Preparing a big attack.* This made the greatest strain on transport and supply, and the necessary conditions of secrecy added complications. In preparing an offensive the traffic tonnage more than doubled per division. This was due to the necessity for making new railways and new roads, and the accumulation of defence material to fortify a new line. But the accumulation of ammunition was also a factor. On a quiet sector two divisions could be

served by three trains daily. For the preparation of a big attack ten divisions might be concentrated on that sector, and those divisions in the preparatory stage of the attack would need about 33 supply trains a day, and during the offensive about 27 trains a day. And these trains would carry material only to broad-gauge railhead. After that most of it had to go farther forward by light railway, motor and horse traffic, and in some cases even by the "Yukon pack," i.e. by man portage. (3) *Resisting a big attack.* The difficult element here was its unexpectedness. The amount of supplies per division necessary to go up from base would be 25% less than in the case of the preparation of a big offensive. There was always carried a good reserve of ammunition, food and engineering stores, close behind the line, and a further reserve of ammunition already loaded on trains at appropriate railway centres. In case of emergency, ammunition could start to move up as soon as a locomotive could be coupled to a standing train. The German offensive in 1918 showed that the British carried near the front line too great reserves, and there were unnecessary losses in food, stores and ammunition, as a consequence. Forward "dumps" were thereafter reduced.

The organization at the front in 1918 to cope with this work in the British army, had at its head the quartermaster-general (Lt.-Gen. Sir Travers Clarke) and two deputy quartermaster-generals (Maj.-Gen. Ford and Maj.-Gen. May). The headquarters staff consisted of about 40 officers, and the detailed work was divided under the following departments.—Director of Agricultural Production (Brig.-Gen. Earl of Radnor), Director of Army Postal Services (Brig.-Gen. Price), Deputy Controller of Canteens (Col. E. Benson), Director of Engineering Stores (Brig.-Gen. Sewell), Director of Forestry (Brig.-Gen. Lord Lovat), Director of Hirings and Requisitions and President of Claims Commission (Maj.-Gen. L. B. Friend), Controller of Labour (Brig.-Gen. Wace), Director of Ordnance Services (Maj.-Gen. Sir C. M. Mathew); Paymaster-in-chief (Maj.-Gen. Sir C. A. Bray); Director of Remounts (Brig.-Gen. Sir F. S. Garrett); Controller of Salvage (Brig.-Gen. Alexander Gibb), Director of Supplies (Maj.-Gen. Carter), Director of Motor Transport (Maj.-Gen. Boyce), Director-General of Transportation (Maj.-Gen. Crookshank); Director of Veterinary Services (Maj.-Gen. Moore); Vice-Chairman Imperial War Graves Commission (Maj.-Gen. Fabian Ware), Director of Works (Maj.-Gen. Sir A. M. Stuart). Subsidiary directorates under the Director-General of Transportation were.—Director of Construction (Brig.-Gen. Stewart), Director of Docks (Brig.-Gen. Wedgewood); Director of Inland Water Transport (Brig.-Gen. Luck); Director of Light Railways (Brig.-Gen. Harrison), Railway Traffic (Brig.-Gen. Murray), Roads (Brig.-Gen. Maybury).

A comparison of this organization with the French administrative services would suggest that the British was over-elaborate. But consideration must be given to these important facts: that the British army was operating in a foreign country, and moreover in the country of an Ally where there must be the least possible friction with the inhabitants, that by custom both men and animals in the British force required a particularly generous ration, that the British force expended far more ammunition than the French, and in its campaign methods kept up a permanent minor offensive even on quiet sectors, as was not the custom with the French. When in the course of the operations early in 1918, French and British troops were intermixed in the battle line, it was found by experience impracticable to supply British units through the French system, and, except as regards such items as hay and petrol, which were kept in a common pool, the supply and transport had to be duplicated, a British system being set up side by side with a French.

Salvage.—An account of the administrative system in the World War would be incomplete without some reference to the salvage activities of 1917-8. The submarine war began to have its cumulative effect just when there came the most peremptory reminders that supply was going to be the determining factor of the final struggle. Munitions, food, equipment, railways, roads, ships—these had become the most important factors, and victory would incline to the force which could best concentrate the means to maintain an

overwhelming force at some particular point, and could best develop, conserve, and transport its material. From 1915 to the middle of 1917 it was only necessary for the British army to ask and it received. Later in 1917, and in 1918, there came requisitions which could not be met. Just before the German attack in 1918 (to give one example) there were desperate calls for barbed wire, to make up an actual shortage of 8,000 tons in the minimum requirements for safety; but it was not available. In food, forage, clothing, timber, metals, the world-shortage had now become acute. The administrative services of all armies sought to better their position, in Europe, by the organization of a department of salvage. As the British salvage department explained, "the shortage of almost every kind of raw material used for war supplies makes salvage an important administrative service. Without a well-organized and thorough salvage system, the full maintenance of our force in the field would be made difficult."

The salvage organization is not intended to take the place of, or in any way discourage, a consistent effort on the part of every supply department to recover for repair and re-issue its own articles and its own empties. It is intended to supplement that effort; to collect and put to use what would otherwise become derelict, to insure that nothing utilizable is allowed to go to waste. There is nothing of the debris of the battlefield which we cannot put to some use. Some of the items of salvage values taken from a monthly return show the wide range of the department—swill for piggeries, £600; solder from old tins, £300; cotton waste, £500; tin-plate (won by unrolling old biscuit tins, etc.), £2,500; old lead, £400; various by-products £200,000. The old rags collected did a great deal to help the cloth shortage at home. The old bones collected made glycerine for explosives. In Sept. 1918 the British army saved £4,000,000, and the American army £3,000,000 by salvage.

The Animals of the Force.—The administration of the animals of the British force—the largest mobilization of animals known to history—calls for a special note. The worst difficulty in their case was mud. From early in autumn until late in spring the mud season lasted. Off the *pavé* roads all the fighting area of Flanders was semi-liquid, and the problem at horse-lines was first to secure a solid "standing," next to secure a solid road in and out to that standing, and finally to secure a solid road to and from a solid watering-place. Standings were usually made of bricks, and the army requisitioned all the brick yards in the occupied area. Shell-ruined villages were another source of brick supply. The bricks had to be set properly; rubble was lost in the soil within a week. Losses from enemy action were not very high among the animals until the last phase. There was little cavalry work except at the end of the campaign and at its very beginning. But horses and mules suffered greatly when the enemy began to use mustard-gas (1917-8). The ground where a mustard-gas shell had fallen was infected for long afterwards. If horses were picketed on it, or even passed over it, casualties were high. The irritant poison of the gas attacked their hoofs and their skins wherever the hair was thin and caused sloughing wounds. An effective curative treatment was found in a dressing, the chief ingredient of which was chloride of lime. From the spring of 1918 the animals suffered severe attacks from the air. The enemy devoted much of his air-force to bombing attacks on horse-lines, with a view to lessening British transport strength. At first these attacks had serious effects. Then horse-lines were camouflaged, the animals were separated into small groups, the lines were protected by bomb-proof traverses of earthwork, which localized the effects of explosions. In the summer of 1918 the wastage of animals by sickness had been cut down to a very low rate (7.7%), as the result of skilful horse-mastership. At this time forage difficulties were acute, but there had been close organization for grading fodder in army and line-of-communication areas, and the animals always had sufficient rations. British administration was able to take a considerable part of the burden of horsing the American units which arrived in France in 1918. Nearly 25,000 animals were made available by reductions of the horse-strength of artillery units. A further 14,000 were saved by giving 6-in. howitzer and some 60-pounder batteries mechanical transport. Another means of economy in horse flesh was the setting up of a "category B" for animals which were not quite fit for arduous work with a fighting unit, and were withdrawn to units whose demands on them were less exacting.

Some Comparisons.—As between the three administrative machines, the French, the British, and the American in the autumn of 1918, certain points of difference may be noted. Both French and American systems still kept a dividing line as regards administration between the base and the fighting line. The British system had abolished this (together with the post of Inspector-General Lines of Communication) in 1917. The French divided the zone of the armies into the zone of the advance and the zone of supplies (with sometimes an intermediate zone). In the zone of their advance administration was in charge of the *Aide major-général chargé de la direction de l'arrière* at G.H.Q. But his administration had no functions of procurement, only of distribution. In some points of administra-

tion the dividing line between the zone of advance and the zone of supplies was abolished, e.g. all motor transport and all light railways, wherever operating, were under a D.A. at G.H.Q. The French system of supply and distribution was fashioned for war in the home-country or near to it, when it was transplanted (for instance, to Salonika) it had to be modified somewhat on the lines of the British system. The American system put administration in the fighting line under an assistant chief-of-staff (G.4) at G.H.Q.; and on the lines of communication under a general commanding S.O.S. (corresponding to the former British I.G.C.). Under the American system the chiefs of the supply services were not at G.H.Q. but at the I.L.Q. of S.O.S. With both the French and the American systems evacuation and hospitalization of casualties were purely "Q" services: in the British army they were under the adjutant-general assisted by the quartermaster-general. Some other differences came from geographical reasons. France itself was really the supply-base for the Americans, whereas the British had the United Kingdom for this purpose, so the Americans held great stocks in depots—15 days of supplies in advance depots, 30 days supplies in intermediate depots, 45 days supplies in base depots. The American army naturally relied more largely on local purchases (from the Allied armies and from European civilian sources) than did the armies with their home bases nearer at hand. General Pershing founded a general purchasing agency to control these purchases. In 1918, out of 17,600,000 ship-tons used by the American army only 7,600,000 tons came from the United States and 10,000,000 tons were purchased locally, and to the end of the campaign the American army drew largely upon British and French supplies.

The British administrative machine in one particular point was inferior to the American machine in 1918. Under the British system the navy had control of all supplies by ship until they left the transport. The navy could put a supply-ship into any port it pleased, and naturally was guided chiefly by shipping considerations. Thus supplies for the southern area might go to a northern port. The American system put the supply ships under army direction when they came within the three-mile coast limit, and they could be directed to the port of supply which was most convenient from the army point of view. The French and the Americans used the railway regulating stations as depots; the British used them as sorting stations only. The British used the base-ports for sorting goods to a great extent; the Americans did not. In the autumn of 1918 the Americans found their one great depot, and sorting and regulating station, at Is-sur-Tille insufficient for the needs of their growing army, and they were proceeding with the organization of another station when the Armistice came.

The general staffs of the various combatant nations were in 1921 still working out the lessons of administration as taught by the World War. One principle seems to be generally accepted, that it is wise to centralize as far as possible all administration under one staff officer over the whole war area, trusting to him to devolve and coördinate. That was the final principle of the organization of the administrative services in the British army in 1918. In the first phase of the war the French organization did a large portion of the work of transporting the British army and its supplies. As the British force grew in strength, and the problem of its administration grew in complexity, the experiment was tried of dividing responsibility between the quartermaster-general of the force and the G.O.C. lines of communication. "Q" tasks were under different control in battle areas and at the base. This did not work satisfactorily, and the next experiment was to divide responsibility between the quartermaster-general and the director-general of transportation (the latter having control of the broad-gauge railways, the former of all other transport). This arrangement broke down in the spring of 1918, when the British army was put into serious jeopardy through the transport situation; retirement south of the Somme had to be contemplated, at one stage as probable, and the details were actually arranged for the destruction of the ports of the Pas-de-Calais so as to deny their use to the Germans. In the

summer of 1918 the British administrative services from the coast line to the trench-line were put under one head, the quartermaster-general, for experience suggested that the commander-in-chief should have one man to whom he could confide the responsibility of the administrative side of his army's operations: to divide the responsibility was not to simplify but to complicate the task. (F. F.)

SURVEYING (see 26.142*).—The most striking feature to be recorded in connexion with surveying generally is the greatly increased importance which it acquired during 1910–20 from a military standpoint. This was chiefly due to the stationary character of the World War on the western front, but other factors contributed, notably the introduction of air-photography. The use of photographs, taken from aeroplanes, to determine the position of enemy trenches and other detail inside the enemy's lines, made a considerable difference in the technique of modern war and reacted upon the methods of peace-time surveys. But not only photographs from the air, but also photographs taken on land have been pressed into the service of surveying, and the applications of photography to surveys of mountainous regions such as the higher Himalayas have been greatly extended.

In exploratory surveying the conditions have been changed and simplified by the introduction of wireless telegraphy, for the determination of longitude; the accurate fixing of his longitude, long the explorer's bugbear, is now no more difficult than taking a latitude. In the more regular branches of the subject the principal matter demanding attention is the development (in which many countries have taken part) of accurate methods of levelling, particularly of precise or geodetic levelling.

Surveying in War

Geographical and topographical surveys are well known adjuncts to military operations. The war of 1914–8 showed that all other classes of land surveying, i.e. geodetic triangulation, levelling, and large scale surveying may be called upon to assist in the development of scientific and mechanical warfare. It is not possible to forecast whether future developments may demand an enhanced accuracy of survey, or whether the increasing importance of aviation, amongst other factors, may not prevent a recurrence of the stationary operations which prevailed over the western front for four years. A description of the more important duties of the Survey battalions on the western front, offers the best record of an intensive large scale military survey.

The Trigonometrical Control.—The extent of the line, liable to periods of intense activity throughout its length, and the constant changes of army and corps fronts made it necessary to provide a homogeneous and complete system of triangulation upon which to base the maps and the local surveys called for.

Five separate and distinct triangulations already covered this area before the outbreak of war, viz.—

1. The French main arcs and subsidiary triangulations of 1800–50.
2. The new French Paris meridian and Amiens parallel and their subsidiary orders of 1890–1900.
3. The French Admiralty coastal triangulation.
4. The Belgian national triangulation.
5. The German national triangulation.

All these triangulations were eventually combined into a single coherent system, but not until just before the Armistice and too late to assist in operations. The surveyors of the various armies kept in the closest touch with each other, but discrepancies arose nevertheless, and time was wasted in fresh observations and recomputation. It was realized somewhat late that the adjustment of the discrepancies of local triangulations is the best preliminary to military surveys.

Many of the stations of the triangulations enumerated had been destroyed or built over before the war and many were destroyed during its progress. Numbers of new stations had, therefore, to be established and the trigonometrical observer was employed in intersection and interpolation, rather than new triangulations.

This patched and reconstructed triangulation stood then as a basis for all the military surveys of the western front.

Provision and Issue of Maps.—The British Expeditionary Force took the field equipped with the 1/80,000 *carte de l'état major* of France and the British 1/100,000 maps of Belgium. Topographical maps of this sort were accurate enough for mobile operations in which no heavy guns were employed. Directly the operations tended to become stationary first on the Aisne, and then in Flanders, staff, gunners, and infantrymen demanded a map of such accuracy and

* These figures indicate the volume and page number of the previous article.

scale that administrative arrangements, lines of fire, and trench systems could be shown upon it. Such a map did not exist except in the Belgian area, and elsewhere had to be made. The earlier war surveys were made upon the plane table on a scale of 1/20,000 and were completed up to the British trench lines. The subsequent development of air-photography, and the discovery of the manuscript sheets of the cadastral communal surveys, made it possible to compile reliable maps, not only of territory in British occupation, but of all that portion of north-eastern France occupied by the German armies.

The trench zone was mapped on a scale of 1/10,000, and forward and back areas at 1/20,000. In all 6,000 sq. m. were surveyed.

A reliable map of the physical and artificial features of the country is not sufficient in itself. The positions of defensive works of the enemy batteries, of the points of administrative importance, and of many other objects must be shown on frequently recurring editions. From 12 to 20 editions embodying such information on various scales were kept up for the actual area of operations, whilst during the progress of a battle daily editions were brought out.

To cope with this volume of printing it was found necessary to provide for the rapid reproduction of trench maps at the Ordnance Survey Office at Southampton and for small but complete lithographic establishments in each army and at G.H.Q. Zinc plates were prepared by the Vandyke process or by helio-zincography, and flatbed printing machines, preferably motor-driven, were used for printing in the field. The French and German armies had well-equipped printing trains which were used for increasing printing facilities in important areas. The French, for example, dispatched a printing train to Italy in 1917. Towards the end the Americans employed a well-designed printing plant in lorries.

A scale of issue of about two copies per officer engaged, of each important map, was maintained, but experience showed that this scale should be increased. During the whole period of operations about 34,000,000 maps were printed for issue to the British troops, of which about two-thirds were printed by the Ordnance Survey in England and a third in France.

For the use of large scale maps in trench warfare a well-thought-out system of coordinates, based on a suitable projection, was needed.

It must be possible to read off at sight the coordinates of any desired point from a "grid" or network of lines printed on the map. All the armies had such systems. Experience proved that for ease and accuracy of reference the "grid" should be in squares, the sides of which can be divided decimally by eye. The artillery often desired coordinates of the same accuracy as the surveyor—i.e. on the scale of nature. The system adopted should therefore be based upon the coordinates used by the surveyor, with an easy form of abbreviation to be used by all arms to define map positions. Accuracy of bearing from any one position must be maintained together with as near an approach to linear accuracy as possible, whilst the system must allow of extension over the whole area of operations.

The considerations which influence the choice of a reference "grid" have already pointed to the desirability of an orthomorphic projection. For the conduct of surveys constantly in progress it is equally important. Computations must be cut down to the minimum, and this is best secured by working on a projection in which the position on the ground and the position on the map can be calculated in one process without sensible error.

From the cartographic point of view the question is not so important, and there are many projections which would provide a sensibly accurate map over large areas.

It was decided late in the war to adopt an orthomorphic projection with two standard parallels which had recently been adopted in the French armies, but the decision came too late, and the Bonne projection continued in use in the British army until the Armistice.

Surveys for Artillery Purposes.—Other things being equal, that artillery will dominate its adversary which has the quickest and most accurate knowledge of hostile battery positions and which can open most quickly an accurate and unexpected fire upon them. The construction and calibration of guns and howitzers, the homogeneity of ammunition, and the measurement of those atmospheric elements which affect ballistics are involved; but accurate survey of the relative positions of gun and target is essential.

The positions of British heavy batteries were, therefore, fixed with a theodolite, each battery was supplied with a chart or "artillery board" on which the map was pasted down, in sections, upon a zinc or three-ply wood surface, and special "bearing pickets" were inserted in numbers in the battery zone. The bearings from these pickets to surrounding objects, suitable as reference objects, were tabulated and distributed.

The positions of hostile batteries were also surveyed with as much dispatch and accuracy as possible by one or other of both of the following methods:—

(a) Intersection of three or more rays observed upon the flash of discharge, the reflection in the sky of this flash, or, upon the smoke puff from the muzzle. This operation, commonly known as flash spotting, was carried out by units, each of which manned four survey observation posts, or instrument stations, and one headquarter post. Each section had its own internal telephone system and was in direct communication with an artillery headquarters.

Observations were directed by an ingenious controlling exchange upon hostile guns in succession. This method, independent of the

map, gave very good results but depended for success upon good visibility. Flash-spotting units could survey the positions of the bursts of our own shell and were, therefore, also used extensively for ranging and for calibration.

(b) **Sound-ranging.**—A sound, in still uniform air, spreads outwards from its origin with an equal velocity in all directions, and the sound waves may therefore be likened to the ripples spreading outwards on a pond from the point at which a stone has fallen into it.

If we now imagine a row of surveyed pegs, more or less tangential to a ripple, projecting from the surface of the water, if we measure the times at which the ripple strikes each peg and know the velocity of the advance of the ripple we shall have all the data necessary for fixing the position of the origin of the disturbance. All armies engaged on the western front had some system for determining the position of a gun from the sound of its discharge, embodying the above principle. It is unnecessary here to describe the British system, except in so far as the survey of the sound-receiving stations is concerned. A sound-ranging base was generally, though not invariably, laid out on the arc of a circle, the centre of which lay in the zone of the enemy's heavy artillery. There were usually six sound-receiving stations about 1,000 metres apart. The coordinates of the selected spot for each station were computed in the office, and the surveyor had to find and mark the corresponding points on the ground. Errors of more than one metre in position resulted in sensible errors in sound-ranging.

Sound-ranging is naturally unaffected by bad visibility, but is put out of action by a moderate wind blowing from base to gun and is interfered with by any high wind. As in the case of flash spotting, a good telephone connexion to the artillery headquarters is essential.

Surveying by Air-photography

Air-photography, or, to be more precise, photography of the ground from the air, has been recognized as a possible method of survey since the middle of the 19th century.

Experiments in photographing the ground from balloons had been made by Col. Laussedat, Major Elsdale and others from 1859 onwards, but air-photographs played no part in any important survey before the outbreak of war in 1914. During the course of the war the difficulty of producing maps on medium scales was enhanced by the inaccessibility of the most important areas. It was due to this fact, and to the development in 1915 of photography from aeroplanes, that large areas in many theatres of war were mapped by the aid of air-photographs. But no full examination of the possibilities was made, and for peace surveys the method still remains in the experimental stage.

Optical Principles.—Provided that the optical axis of the camera is vertical at the moment of exposure, the resulting photograph of a flat level area will be an accurate plan at a scale determined by the equation

$$\frac{f}{h} = s$$

where f is the focal length, h is the height of the camera above the ground at the moment of exposure, s is the representative fraction of the scale.

Such photographs will be called vertical photographs. As a rule, however, the photograph is not exactly vertical, but the axis is tilted at an angle to the vertical. The photograph then becomes an inclined perspective view. (See Fig. 1.)

FIG. 1.

If the direction and magnitude of the tilt of the axis were recorded at the moment of exposure it is obvious that the photograph could be projected optically or photographically on to the plane of the map, although it would remain unfixed in position and orientation. If the direction and magnitude of tilt are unknown then the projection on to the required plane, or "rectification," is secured by comparing the relative positions of four surveyed points on the

ground and on the photograph, which is then also fixed in position and orientation. Where the tilt is known, approximately three points common to map and photograph will furnish a solution. Two further points of importance are that (1) straight lines upon a plane remain straight lines upon any perspective view of that plane; (2) at any point on an inclined perspective view the scale is not the same in directions parallel to and perpendicular to the axis of tilt.

In plotting detail from vertical photographs certain errors, due to instrumental imperfections, may arise but are seldom of sensible magnitude. These are due to (1) a change in the relative position of plate lens and area photographed, due to the shutter moving so comparatively slowly that the movement of the aeroplane becomes noticeable on the plate; (2) distortion due to optical imperfections of the lens.

Construction of the Map.—In order to explain how a map is built up, wholly or partly, from air-photographs it is advisable to take some illustrative cases. The simplest case is where it is desired to produce a map of an area in which a sufficient trigonometrical control already exists and of which there is available a complete collection of cadastral plans, which are, however, much out of date. Ground features are low and gently undulating, extreme difference of altitudes being two or three hundred feet only.

In such a case topography can be brought up to date from air-photographs taken with the axis as nearly vertical as possible, and fitted upon the cadastral framework by one or other of the methods described below. When this is complete the map is contoured in the field, names are added and the topography examined for omissions or mistakes.

The most difficult case arises when the area to be mapped is rugged and mountainous, and the inhabitants hostile—the positions and heights of a few peaks in it, visible from accessible ground, have been fixed trigonometrically, but no reliable map exists.

As a preliminary measure oblique photographs are taken from a variety of points of view. The positions of the camera in space are calculated, and from measurements on each photograph a number of rays are drawn to noteworthy points in the valleys and on the hills. Positions and heights are thus determined for a subsidiary control. With the axis vertical a series of photographs of valleys and of watersheds are taken, pasted together, and fitted to the control. When the map has been thus built up, form-lines are added from the oblique photographs and upon the fixed heights. In the majority of surveys difficulties will be of an order intermediate between those of the foregoing two cases.

Applications of Air-photography.—In any particular survey air-photographs may be used then for any or all of the following processes, viz.:—(1) Air-photo control, (2) Air-photo-topography, (3) Air-photo contouring.

In taking vertical photographs for air-photo control, exposures are so regulated as to ensure a substantial overlap, generally amounting to 50% at least. Each successive photograph may therefore be fitted to its predecessor, and lines or traverses of photographs may be mounted and scaled between fixed points. Any two or more traverses of different and independent lines may be made to intersect over some topographical object, the position of which may be determined as the simple, or weighted, mean of the individual positions from each traverse. Traverses may also be made to converge and end upon some prearranged and hitherto unfixed object. This method has given fairly accurate results in flat country on the scale of 1/10,000, and is dependent upon the ability of the pilot to maintain an even keel and a constant height.

In broken and hilly country no method can be regarded as trustworthy which does not take into account differences of altitude. We must then be content to limit the use of each photograph to the measurement of horizontal and vertical angles and to fix the positions of new points by intersection from two or more photographs. Where this principle is decided upon there remains no advantage to be derived from the vertical photograph, and oblique photographs are used in preference as covering larger areas and allowing greater refinement in the measurement of vertical angles.

The first stage of this photo-topography from the air is to inter-point the position of exposure in space from three or more points, the positions of which on the earth's surface are known, and which appear on the photograph. If we consider the pyramids whose apices are the lens and the bases of which are the triangles formed by the three fixed points respectively on the ground and on the photographic plate (see fig. 2), we see that (a) the angles at the apex are a function of the lengths ab , ac , bc (which can be measured upon the plate), and of the focal length, (b) the inclination of the ground pyramid to its base is determined by the direction and magnitude of tilt; at the present time there are no means of measuring accurately the tilt of the plate at the moment of exposure, and calculation follows by successive approximations from a preliminary estimation, (c) the position of O in space can be calculated and plotted in its correct projection on the plane of A , B , C ; (d) angles may be measured upon the plate and rays drawn to additional points from O .

From the nature of the case air-photo control must be limited to the position of a few supplementary points.

Where the area to be mapped contains a sufficiently close control the filling in of topographical detail is more easily done from vertical than from oblique photographs, providing that the area in question

is not markedly hilly. The scale on which photographs are taken may be larger or smaller than that of the map, but it must be sufficiently large to allow of clear identification of detail.

The area to be mapped is photographed from a prearranged height in strips allowing for an overlap in all directions. Much depends upon the training of the pilot in maintaining his height and his overlap. It is usual to arrange for a mechanical control of exposures regulated according to the ground speed of the aeroplane.

FIG. 2.

The plotting of detail from these photographs would be simple if the axis of the camera could be maintained in a vertical position. It would then be necessary only to bring the photograph to the scale of the map. No means of ensuring this verticality has, as yet, been evolved. It often becomes necessary, therefore, to fit photographs individually upon the control points. This can be done graphically, or optically by the *camera lucida*, or by the enlarging camera.

The graphic method depends upon the principle that as straight lines on one plane remain straight lines on any perspective of that plane the position of a point which lies upon the intersection of two lines common to the ground and to the photograph may be readily determined. Within narrow limits the proportional compass set to the difference of scale between map and photograph at this point may be used to fix additional points. It is more accurate, however, to maintain the straight line principle and to cover the map and photograph with a "grid" of corresponding lines, as in fig. 3.

FIG. 3.

The photograph is mounted on a sheet of paper— a , b , c , d and A , B , C , D are four points the positions of which are known and are also identifiable on the photograph. Subsidiary common points at o are established by drawing the diagonals, and four subsidiary quadrilaterals may then be formed by drawing lines through o from v and w —the intersections of the prolonged sides of the quadrilaterals. The same principle may be applied to any polygons formed by joining up any number of points (more than four) which are fixed on the ground and identifiable on the photograph. Detail may be sketched in by eye.

A useful method of plotting, known as the four-point method, is as follows (fig. 4): It can be proved that the cross ratios of four points which lie upon a straight line are the same upon any perspective view of that line, hence we can readily plot the position of a fifth point (S) if we know the positions of four points A , B , C , D .

Let A , B , C , D be four known points on the photograph and a , b , c , d their positions on the map, and let S be a point on the photograph the position of which on the map is to be found.

Join A B , A C , A S , and A D , a b , a c , and a d .

Lay a piece of paper with a straight edge, in any position cutting the lines $A B$ in B' , $A' C$ in C' , $A S$ in S' in $A D$ in D' and mark these cutting points on the paper.

Now lay the paper strip on the map and fit it upon the lines $a b$, $a c$, and $a d$, so that B' , C' and D' lie upon these lines.

Mark on the map the position of a point s' opposite the mark S' on the paper strip. Join $a s'$. Then s , the position of point S , upon the map, lies upon the line $a s'$.

FIG. 4.

Repeat this proceeding from B , C , or D , and another line $b s'$, $c s'$, or $d s'$, will be secured, the intersection of which with $a s'$ will define the position of S .

The camera lucida (see 5 104) has been used extensively for plotting. The upright carrying the prism is mounted on a stand upon which are also mounted two boards roughly at right angles to each other called respectively the map and photograph boards. Movements are added to allow of rotating the photograph in its own plane, of tilting the map (or tracing of control points) around an axis parallel to a marked horizontal line on the photograph board, and of increasing or decreasing the distance between the prism and the photo board (fig. 5).

FIG. 5.

Graphic and optical methods are tedious and lengthy compared with a photographic rectification. The ordinary enlarging camera can be made to answer the purpose with little modification. It must provide, in addition to its focusing movements, as follows—

1. The negative must be capable of rotation in its own plane around its centre.
2. The copying board and negative carrier must be capable of rotation around parallel axes which are at right angles to the optical axis of the lens.
3. The copying board and negative carrier must be capable of movement along the line axis of the lens.
4. The negative carrier must be capable of a movement bodily at right angles to its axis of rotation.

By means of these movements a coincidence can be obtained between the four control points on the map and on the photograph, and a "rectified" print may be obtained.

Little contouring has as yet been based on air-photographs. It must be recognized at the outset that it is impossible to calculate relative heights from measurements taken from a single photograph; for the accurate determination of relative heights we must have at least two photographs taken from different places. An outline of photogrammetry from the air has already been given and mention has been made of interpolation in space, and of the survey of new points by intersecting rays. A short additional step—the measurement of vertical angles on the plate—makes it possible to calculate the height of these new points.

Stereo-photogrammetry from the air may develop in the future, but has not been made use of hitherto. On the other hand much use has been made of the stereoscopic effect visible on two photographs of the same area taken from different positions. Such information is not of an exact nature but gives a valuable indication of ground forms and brings out the system of drainage.

Until 1920 mapping from air-photographs had been confined almost entirely to war time, and to areas already covered by a trigonometrical control, hence there had been little opportunity of comparing the cost of this method with that of any other, or of laying down definitely its possibilities and limitations. Clearly its greatest value lies in the mapping of inaccessible country.

So far as can be judged, the chief fields of usefulness open to air-photo-topography are, the surveying of native towns on scales of about 1/10,000, or 6 in. to 1 m.; the surveying of deltas and intricate water channels, and the surveying of ancient sites, on which the indications of a former civilization become far more evident in the air than on the ground. Topography on ordinary small scales, and accurate large scale cadastral mapping are, so far, ruled out. But it appears that developments may very well be looked for in each of these directions.

Photographic Surveying

The idea of applying photography to surveying was originally due to Col. Lausselat (1810-1907), who made some experiments in the matter in 1850, and continued during his long life to expound and develop the method. Although the system originated in France not much was done in that country in the way of its practical application, and, if we except some minor work by M.M. J. and H. Vallot in the Mont Blanc region in 1892 and some similar mapping by M. Flusin in 1905, it is to Canada that we must go for its first use on any considerable scale.

In 1895 Mr. E. Deville, surveyor-general of Dominion Lands, published his important work on photographic surveying, which remains a complete exposition of the subject if we exclude some recent departures. Between 1886 and 1892 photographic surveys were confined to the Rocky Mts. in the neighbourhood of the Canadian Pacific railway, but in 1893-4 the method was used by Mr. W. F. King in the survey of the Canada-Alaska frontier. In 1901-2 Mr. A. O. Wheeler carried out a very successful photographic survey of the Selkirk range, British Columbia, on the scale of 1/60,000, this was published, with an interesting account of the range, in 1905.

In the U.S. photo-topographic surveys had been made use of on the International Boundary Survey and reports made by Mr. M. A. Flemer of the U.S. Coast and Geodetic Survey in 1897-8. Stereo photo surveys (see below) were employed in the survey of Tutuila, Samoa, by the U.S. Hydrographic Office in 1916, and an innovation in the shape of a panoramic camera was first used by Mr. C. W. Wright in Alaska in 1904 and extended by Mr. J. W. Bagley who wrote an important treatise on the subject in 1917 (Washington, Government Printing Office).

In 1907-8 Lt. M. Weiss, of the expedition commanded by Duke Adolphus of Mecklenburg, made a photo-survey of the volcanic Mfumbiro Mts. to the N. of Lake Kivu. Other fragmentary surveys in various parts of the world have been carried out by the aid of photographic methods; most of them, as well as those mentioned above, were in mountainous country.

Outline of the Method.—Assuming that a photograph is a true perspective view, that the plate was vertical when exposed, and that the horizon-line and focal length of the lens are known, it is clearly possible to determine the horizontal and vertical angles from the point where the camera was set up to all objects represented in the photograph, the horizontal angles being measured from some known, represented object. If two such photographs are taken from two points, at known distance apart, we have the means of determining the distance and height of all points shown on both photographs. It will therefore be necessary in planning a photographic survey, to arrange for a triangulation to fix the relative positions of points at which the camera will be set up, and the first stage in the office work will consist in the plotting of the triangulation. A camera

station need not, however, be a trigonometrical point, provided that its trigonometrical position can be measured from the photograph. To use the photographs for plotting the detail, from each camera station A draw, at its correct angle, the central line of view. Along this line draw A x, equal to the focal length of the lens, through x draw a line at right angles to A x and plot from x the projections of the distant points, as measured on the horizon-line of the photograph. The intersection of rays from A to the points so obtained, with rays to the same objects from other stations, will give their positions.

It is an almost universal rule of photographic surveying from the ground to maintain the photographic plate in a vertical position, because any inclination of the perspective plane of the plate adds difficulties to the plotting.

A supplementary order of triangulation is usually added contemporaneously with the field work of photogrammetry, both to fix camera positions and to add a few bearings and vertical angles from which the photographic data may be checked.

For many years cameras specially designed for surveying work have been available, a good example being the Bridges-Lee photo-theodolite. The essential features of these are, that the focal length should remain constant (for which purpose the sensitized surface of the plate should be pressed firmly against the frame of the camera), that the position of the optical centre, and of the horizon and principal planes should be deducible from marks on the plate, and that the lens should be free from distortion and aberration. It is also important to provide levels by means of which to ensure the verticality of the plate. The later photogrammetric cameras are either interchangeable with transit theodolites on the same portable stands, carry eccentric telescopes, or else combine the two instruments by substituting a telescopic lens for the usual photographic lens, and by inserting an eyepiece in the back of the camera. The field work demands a high standard of topographic training, for it is not easy to select the minimum number of views sufficient to cover the country whilst leaving no gaps. Valleys and low-lying areas constitute the main difficulty. One or two stations *per diem* are all that have been occupied by the same party in the photogrammetric surveys of the Canadian N.W. frontier, whilst a supplementary triangulation was carried on concurrently.

The office work takes two or three times as long as the field work and consists in plotting positions, calculating heights, and drawing contours from data measured on the developed plates.

The picture trace will naturally assume the form of the arc of a circle if a panoramic camera is used such as that employed during 1910-6 by Mr. J. W. Bagley in Alaska.

There are several plotting devices on the market, such as the perspectograph, but they have not been largely employed. On the other hand vanishing scales and perspectometers (grids showing the perspective on a vertical plane of a series of squares on a horizontal and lower plane) can be readily constructed.

Stereo-photo Surveying.—The most recent development of photographic surveying consists in the employment of the stereoscopic principle. The stereoscope as a toy has long been known, but Dr. Pulfrich of the firm of Zeiss of Jena, and Col. von Hübl of the Austrian military geographical service, conceived the idea of applying the stereoscopic principle to the service of exact surveying. Other pioneers in 1907-8 were the late Capt. F. V. Thompson, R.E., and Mr. Conrady. In 1913 Mr. G. Müller carried out a successful stereo-photo survey for part of the proposed Hankow-Ichang railway. In order to carry out a normal photographic survey successfully it is necessary to arrange for stations far apart and for intersections of some 30 degrees or so. But in stereo-photo surveying two stations can be occupied on the same hill-top and their distance apart need only be some 50 to 300 feet.

In the simplest case let two vertical photographic plates be exposed from two points, say 100 ft apart, let the plates be in the same plane and their centres on the same level. Then if these plates are put into a stereoscope provided with a system of lenses and prisms such that the eyepieces are brought to a convenient distance for seeing, we shall clearly get a very much magnified stereoscopic effect as compared with what is obtainable with the naked eyes. In the diaphragm of each eyepiece let there be a similar movable mark, or line on glass. On looking through the eyepieces the marks in question will appear as a single mark floating in space, and by vertical and horizontal adjustments this mark can be made to touch any given object in the picture. We have, thus, a means of measuring small parallaxes and vertical angles, and these can be read off graduated micrometer heads.

A stereo-comparator as above described gives angles from the centre of the plate, distances and vertical angles; but the reading is laborious and the map has to be constructed point by point.

In 1907 Lieut. von Orel, of the Military Geographical Institute of Vienna, attempted the construction of a machine which should quasi-automatically draw the map, and in 1909 such an instrument was made by Zeiss of Jena. A further model of 1911 permitted the automatic drawing of contours and the outline of detail. The instrument is called the stereo-autograph; several have been made and are in existence in Austria, Germany and France. A stereo-autograph is, of course, an expensive instrument and requires a skilled operator and good plates of even density. But, given these conditions, practical results have been obtained and the method is one

to be reckoned with in the future. Generally with stereo-photography we are not limited to a country with marked features, as is the case with normal photo-topography. Provided that the view is clear, gently undulating or flat country can be as well surveyed and contoured as a mountainous region. The method has some obvious applications, but it is useless in forest-clad country or in towns and its value largely depends upon good view points. The old, photographic surveying has as its chief field of usefulness a well-marked mountainous region. The new is not so limited but its rôle has not yet been fully determined.

Bibliography of Photographic Surveying.—In 1895 Mr. E. Deville was able to quote the titles of 26 works on photographic surveying; in 1911 Dr. Pulfrich in his *Stereoskopisches Sehen und Messen* mentions 276 works, chiefly in German, on stereo-photography alone! The following books may be recommended: *Photographic Surveying*, E. Deville, Ottawa, 1895; *Hints to Travellers*, vol. 1 R.C.S., 1906; *The Use of the Panoramic Camera in Topographic Surveying*, James W. Bagley, Washington, 1917; *Revue Générale des Sciences*, March 1914, Paris, for stereo-photo-topography.

Longitude by Wireless Telegraphy

The chief technical difficulty which explorers and surveyors in new countries have hitherto experienced has been in the determination of longitude in regions unprovided with a telegraph system. This applies to almost all the unexplored, or little explored, parts of the world. Since 1910, however, the great advance made in the transmission of signals by wireless telegraphy has completely done away with this source of difficulty and error. Wireless "receiving" sets are now made of a very portable character; so much so, that one mule or one porter can carry the whole apparatus. Frequent practical use is being made of this method of obtaining time signals, as the following instances will show. In the year 1912 Comm. Edwards fixed positions during the Bolivia-Brazil boundary commission by wireless signals from Washington and intermediate stations; in 1913-4 Cav. Dr. Filippo de Filippi in an expedition to the Karakoram used wireless signals from Lahore and from Italy; Major A. J. Woodroffe in 1913-5 determined longitudes on the Peru-Brazil boundary commission by wireless signals sent from Senna Madureira, Brazil; in 1914-7 the French explorer, Lt.-Col. J. Tilho, used wireless signals from Paris to determine longitudes in his explorations of Tibesti, Borku, Erdi, and Ennedi; in 1917 Capt. A. J. Bamford determined the longitudes of Bagdad and Kermanshah by wireless signals from Fao, which had previously been connected with Basra; in 1919-20 the American traveller, Dr. A. Hamilton Rice, made use of wireless signals from Annapolis, Washington and Darien, to determine longitudes during his Amazonas expedition. Fig. 6 illustrates the wireless receiving set used by Dr. Hamilton Rice in 1919-20; it was designed by Mr. J. W. Swanson and Mr. P. F. Godley, and was found quite satisfactory and very portable.

It is safe to say that, in future, no properly equipped exploring expedition will be without its wireless receiving set. The designs of these sets will change from time to time and, no doubt, improvements will be made, but the method has proven to be thoroughly practical, and the extra amount of transport required is already of a negligible character. One of the greatest difficulties of the explorer has thus been removed.

Levelling

Since 1910 much progress has been made in the development of a sound system of levelling, especially with regard to precise, or geodetic levelling, i.e. that levelling which provides the framework on which all national levels depend. The now defunct International Geodetic Assn. laid down some wise rules on the subject of the precision of work of the highest standard. The admirable treatise of M. Ch. Lallemand, *Nivellement de haute Précision*, marked a great advance on previous text-books, and the production of the modern geodetic levelling instruments of France, the U.S. and Switzerland afforded the means of greatly increasing the accuracy of observation. To this should be added the introduction, by the Ordnance Survey of the United Kingdom, of a specially devised kind of permanent bench-mark, which did away with a weak element in the old levelling, the instability of the ground marks.

Levelling Instruments.—As a type of the instruments in use for levelling of high precision the level designed by Dr. Wildt, and made

Set packed for transport

Receiver and Loop set up ready for use.

Receiving Signals.

FIG 6.—Portable Receiving Set

by the Carl Zeiss optical works of Jena, may be taken. Levels of this kind are also manufactured by Messrs. T. Cooke & Sons of York and Messrs. E. R. Watts & Son of London. The instrument includes the following modern improvements which distinguish it from the levels used for rougher surveys or engineering work; the bubble is read from the eye end of the telescope, so that it is not necessary to disturb the instrument by walking to its side and bending over to read it; the final levelling of the instrument is effected by means of a slow-motion screw which slightly tilts the telescope; and the level is provided with a micrometer attachment in the form of a plate of glass with parallel faces in front of the object glass and this attachment can be tilted by means of a screw, the amount of the tilt being read on a graduated drum. The use of this micrometer attachment enables readings to be made by the intersection of graduations on the staff, instead of by estimation. It is essential in using this attachment that the sights should be of equal length. Various patterns of staves have been used by different survey departments. The Ordnance Survey, for the new geodetic levelling of England and Wales, used staves manufactured by the Cambridge Mathematical Instrument Company. These staves are 10 ft. long and the graduations are marked on a strip of invar (an alloy of steel and nickel which has a very low factor of expansion); fixed to each staff is a circular level, for the staff-holder to keep it vertical.

Ground Marks.—The ground marks to which the observations are taken in the field are of various kinds and are known in British surveying as bench marks. The bench marks in use on the Ordnance Survey are: first class or fundamental, second class, which consist of flush brackets made of bronze let into a wall or other vertical surface, and fixed with cement, rivets, let into horizontal surfaces, such as pavements; and, third class, bench marks cut with a chisel in brick or stone walls, of broad-arrow shape.

The fundamental bench marks are new. It is well known that bench marks of the ordinary type are in general unstable; walls or houses are pulled down, or are subject to settlement, bench marks on isolated stones have been known to be moved and set up in new positions, marks on pavements or kerbs are shifted. None of the old types of bench marks is satisfactory as constituting permanent records of height and position. Moreover, in certain localities, such as mining areas and clay hillsides, the ground itself is unstable. It was therefore decided in planning the geodetic levelling of England and Wales that fundamental bench marks would be devised which should be of a very stable nature. These are established at intervals of about 25 m. from each other, the sites are carefully chosen and no bench mark of this kind is placed on loose soil or rock liable to local disturbance. In constructing such a mark a pit is dug through the soil, sub-soil and loose rock, until sound rock, or hard chalk, is found. The bottom and sides of the pit are lined with concrete, and two reference marks are placed in the bottom concrete, one of bronze and one of polished flint; these are covered with removable caps of metal. When the observations have been finished the pit is filled with sand or other suitable dry material. The internal marks described are those which are used for departmental purposes; but, for the public, an external mark is also provided. It is hoped that these marks will last for many hundreds of years and will, in the future, afford valuable information with regard to vertical movements of the crust of the earth.

Method of Observation.—The system of carrying out the observations in the field is based on the following principles. In order to minimize the effect of systematic error the levelling of any line is carried out once in each direction; the interval of time between successive levellings should be as short as possible; to minimize the effect of inclination of the line of sight the distances from the instrument to the fore and back staves should be as nearly equal as possible; to

enable the graduations on the staves to be read easily the length of a space between the two staves is not in precise work to exceed 100 yds., to reduce the effect of refraction, no reading is allowed even with the lower stadia hairs nearer than 6 in. from the lower end of a staff; observations are not allowed in bad or windy weather; the level is to be shielded from the direct rays of the sun.

It is on the observance of these and other common sense rules that the accuracy of the work will largely depend, and great attention must be paid to details, such as keeping the staves truly vertical or not letting the staff fall heavily on the picket or bench mark.

Errors.—The errors to which levelling is subject may be divided into those due to the staff, those due to the level, those due to the staff-holder, those due to the observer, and those due to the state of the ground, atmospheric conditions and unknown causes. The system of observation above described is directed towards eliminating, as far as possible, all errors not purely personal. Ultimately, when everything is done to evolve a sound system, it is the human element which tells most in the result, and the observer should possess excellent eyesight, a good stock of patience and be scrupulously honest; for in this, as in all scientific measurement, there must not be the least bias or wish to obtain a particular result. If the errors were all accidental and subject to the ordinary law, the probable error should increase as the square root of the distance levelled. There is, however, in levelling, a factor known as the "systematic error," by which the far end of a line constantly tends to appear the lower. If this systematic error were quite uniform, then double levelling would completely eliminate it; but this is not quite the case, and in the result, we are left with errors mainly accidental, plus an unknown amount of error not strictly subject to the law of accidental errors. A careful investigation by the Ordnance Survey has shown that the safest course, and that most in accordance with the conditions of the case, is to treat the whole error as accidental and as accumulating in proportion to the square root of the length of the line levelled. This is contrary to French practice. The probable error of 1 m. of double levelling is usually calculated from the formula $e = 0.67 (\sum d^2 / M)$, where $\sum d^2$ is the sum of the squares of the discrepancies between the forward and back levelling from mark to mark, and M the length of the line in miles. The value of the probable error so obtained will usually be less than that obtained from a consideration of the closing errors. In recent Ordnance Survey precise levelling the value of e , from the above formula, is found to be somewhat less than .003 ft., whereas the value found from a discussion of the actual errors of closure of the level net-work is .0077. The probable error accumulated in the net-work between Newlyn in Cornwall and Dunbar in Haddingtonshire, two places separated by about 700 m. of levelling, is 0.16 ft., or about 2 in. This figure will serve to give an idea of the accuracy of modern precise levelling.

AUTHORITIES.—See Close & Cox, *Text Book of Topographical and Geographical Surveying*, (H.M. Stationery Office, London, 1913); Middleton & Chadwick, *A Treatise on Surveying* (1911), chiefly of value for engineering surveys; W. Norman Thomas, *Surveying* (1920). (C. F. CL.; H. S. L. W.)

NAUTICAL SURVEYING

Although the World War restricted hydrographic surveying work, it led to improvements in methods and in instruments.

So far as the British Naval Surveying Service was concerned, it had generally been considered before that a marine survey need not be carried out with the degree of accuracy which is rightly considered necessary in purely land surveys; it being

contended that so long as a marine survey was graphically correct very little attention need be paid to topographical details. Before the war the delineation of topographical details was but a secondary consideration in a hydrographical survey, and it was limited to the accurate fixing of objects conspicuous from seaward, contouring, except in large harbour plans, was generally sketched in by form lines. The experiences in the World War showed that in localities of possible strategic value accurate topography is of great importance. Where no land surveys are in existence or contemplated, the delineation of the land features must be included in the hydrographical survey. The lack of information due to the neglect of this important subject was much felt during certain operations of the war, particularly as affecting long range naval bombardments. The necessity for this accurate work on the part of the hydrographic surveyor has resulted in the adoption of new methods and of new instruments and the more general use of the land surveyor's instruments, all of which undoubtedly tends towards the more accurate charting of the seas. The elaborate methods and rigid accuracy of a triangulation on shore have been recognized by marine surveyors, although the refinement necessary for so-called first-class triangulation work does not often present itself.

Instruments.—Theodolites in current use (1921) are 4 in., 5 in. and 6 in. The majority of these, formerly graduated to one minute, read to 20 sec. by Vernier, and micrometer theodolites read to 10 seconds. The use of the theodolite for astronomical and tachometer work largely increased. Sextants for observing, with stand and artificial horizon, continue in use, but improvements in the sextant such as an endless tangent screw and electric light for night work have been adopted. More portable folding stands with slow-motion screws for movement of the sextant in azimuth and altitude are also supplied, and in addition amalgamated troughs, consisting of gold-covered plates on which a thin film of mercury is floated, have superseded the old artificial horizon consisting of a mercury bath, the new pattern is far less sensitive to earth tremors caused by surf, traffic, etc.

The Astrolabe à Prisme, a very precise instrument for finding position, enables altitudes of any stars at the exact altitude of 60° to be observed (see John Ball and H. Knox Shaw, *A Handbook of the Prismatic Astrolabe*, published by the Egyptian Government, Cairo Government Press, 1919).

Measuring chains have been almost entirely superseded by 100-ft. and 500-ft. steel measuring tapes, which are supplied with standardization certificates. The "10-ft. pole" has been supplemented by a "20-ft. pole" operated by two men and consisting of two boards connected by a wire 20 ft. in length and used in conjunction with a sextant. This method of measuring distance is, however, being gradually superseded by the use of tachometers and tachometer staves marked according to the Admiralty pattern, with which distances up to over 2,000 ft. can be very accurately measured.

One-metre base range-finders are useful in measuring short bases for plans of harbours, etc., when time or circumstances do not permit of a more accurate method.

Of the various forms of heliostat the Galton sun signal has proved a most excellent instrument, and fitted to theodolites it allows of the sun's rays being expeditiously and accurately directed to, and kept on, the station desired, whether the latter is visible or not.

Ship sounding has been greatly improved by the introduction of the Douglas Schafer sounding gear, which enables ship sounding to be carried out under way in any depth up to about 40 fathoms with great speed; other methods of sounding such as the "Somerville" gear have also been adopted, and, in addition, far greater attention has been paid to sweeping for rocks, shoals, etc., the method used for mine-sweeping having been adapted to this purpose.

Other entirely different methods of sounding were also due to experience gained during the war. The most popular method under trial in 1921 was "Acoustic Depth Sounding" which depends on the principle of the acoustic echo, the depth being measured by the time taken for the shock of an explosion or other impulse produced in a ship to reach the bottom and be reflected back as an echo to a receiver on board the ship. By this device it was hoped to obtain either a single indication of the exact depth at any moment or a continuous indication of the depth registered automatically at any selected position. The importance of this method of sounding from a ship under way at any speed, without the necessity of casting the lead, needs no insisting upon.

Taut wire measuring gear was in 1921 fitted or being fitted to all British surveying ships. This method of measuring distances at sea in comparatively shallow depths had proved most successful and was adopted after having been extensively used in connexion with mine-laying during the war. The ship preserves a steady course and at a constant speed over the distance to be measured and at the same time runs out a thin piano wire from a drum which carries many miles of the wire. It is laid taut by means of a special brake

device, the amount of wire out being registered on a dial. A correction (always subtractive) must be made for errors. This varies from 1,000 to 3,000 ft. in a distance of 100 m., and is governed by the contours of the sea bed upon which the wire has been laid. The dial registers 1,000 rev. for a mile of 5,280 ft., consequently when plotting in sea miles a second correction, for latitude, is necessary. This method of determining distance is specially useful when surveying out of sight of land, and is used in combination with astronomical observations and moored beacons.

Fixing Positions of Ships, Buoys, etc., by Subaqueous Sound-ranging.—This new method of accurately fixing the positions of buoys, etc., is carried out by dropping an explosive charge at the position it is required to fix. The sound of the explosion travels through the water to a number of hydrophones suitably placed, and the positions of which are accurately known. The differences between the times at which the shock reaches the various hydrophones are recorded photographically by a galvanometer on shore, to which the instruments are connected by cables. From these observations it is possible to calculate a position line for each pair of hydrophones. Three or four such lines from hydrophones suitably placed will give a cut, which is the position of the explosion.

As in all surveying problems, the accurate fixing of a point from two others depends on the length of the base, that is, the distance between two known points, so does the accurate fixing by sound through the water depend on the hydrophones, or groups of hydrophones being such a distance apart, commensurate with the distance at which it is required to fix the buoy, etc.

Chronometers.—Surveying ships are now supplied with from 8 to 12 chronometers of the box type, with pocket chronometers for use outside the chronometer room. The chronometers supplied are selected instruments which have successfully passed most exhaustive tests at the Royal Observatory, Greenwich. For astronomical work on shore, the portable Lindqvist chronograph is employed. In this instrument, a chronometer fitted with special contact pieces automatically sends an electric current every two seconds through an electro-magnetic coil, and thus, by suitable mechanism records every alternate second as a perforation on a paper tape, which is kept moving at a uniform rate by means of clockwork. The closing of a switch by the observer operates a second coil, which records the instant of observation in a similar manner by making an additional perforation in the tape.

Wireless Telegraphy for accurate time and obtaining meridian distances has been adopted, and in this connexion the wireless Vernier time signals made by Eiffel Tower may be mentioned.

Amongst minor improvements introduced in surveying appliances since 1910 may be mentioned the standardization of the markings of leadlines, improved buoys for beacon work, light filters for fitting to the eyepieces of sextant and theodolite telescopes.

By 1921, platinum and stainless steel mirrors for sextants and sun signals were under trial, electrical lighting arrangements to sextants and theodolites; eye shields for use in observing to assist in perfect orientation of the head, sextant supports to facilitate observations at sea; the arcless sextant which enables angles to be taken and read off (on a drum) without the necessity of removing the eye from the telescope; wireless telegraphy outfit for use of detached parties, and the gyro compass, were all in various stages of experimental development. The Pillsbury current meter was entirely superseded by the Ekman current meter, and other meters such as the Daisy and Curley were in use.

In calculating triangulations considerable time is saved in correcting for false station by use of the station corrector diagram, by which the correction can be obtained very quickly to any accuracy required (generally about 5 sec. of arc) and the tedious trigonometrical calculation avoided. The slide rule has come far more into prominence for small rough calculations. As the result of modern inventions, it has been found necessary in recent years to produce special charts for the use of submarines and for other purposes in addition to the ordinary navigational chart. Charts for submarines indicate graphically the nature of the sea bottom, so as to indicate where vessels can rest with safety.

The introduction of wireless direction-finding stations as an aid to navigation has necessitated the production of charts drawn on the gnomonic projection, by the use of which positions can be more accurately determined. Additional charts are also required for testing range-finders and compass adjusting. Physical charts indicate the direction of prevailing winds and ocean surface currents at different periods of the year, localities and time where ice may be fallen in with, and the direction and force of the stream and drift currents of the oceans.

Considerable gain in accuracy has been obtained by printing charts directly on backed paper, whereby the distortion incidental to the old system of subsequently mounting them is largely eliminated. (H. P. D.)

SUTTNER, BERTHA, BARONESS VON (1843-1914), Austrian writer (see 26 171), who in 1911 became a member of the advisory council of the Carnegie Peace Foundation, died at Vienna June 21 1914.

See H. v. der Mandere, *Bertha Suttner* (1909).

SUTTON, SIR HENRY (1845-1920), English judge, was born Jan. 10 1845. He was educated at Rugby and Christ's College, Cambridge, where he graduated in 1868. He was called to the bar in 1870, in 1890 was made junior counsel to the Treasury, and in 1905 was raised to the King's Bench division, being knighted in 1906. He retired in 1910, and died in London May 30 1920.

SVENDSEN, JOHANN SEVERIN (1840-1911), Norwegian composer (see 26.175), died at Copenhagen June 14 1911.

SWAN, SIR JOSEPH WILSON (1828-1914), English physicist (see 26.179), died at Warlingham, Surrey, May 28 1914.

SWAYTHLING, SAMUEL MONTAGU, 1st Baron (1832-1911), British financier, was born at Liverpool Dec. 21 1832, and came of a Jewish family named Samuel, but afterwards took by royal licence the name of Montagu. Beginning in early life in a very humble way of business he gradually acquired great wealth by enlarging its scope, and he rose to the head of the most important arbitrage house in London. A strong Liberal in politics, he sat in Parliament for the Tower Hamlets from 1885 to 1900, he was a member of the Gold and Silver commission of 1887-90, being himself a bimetalist. He was created a baronet in 1894, and raised to the peerage in 1907. Throughout his life he was a zealous promoter of Jewish interests, founding the loan fund of the Jewish board of guardians, the Jewish working men's club and several synagogues, and for his work on emigration schemes for the persecuted Russian Jews he made many journeys in Europe and America, succeeding Sir Julian Goldsmid as chairman of the Russo-Jewish Committee. He also helped to establish a modern secular school for Jews at Jerusalem in 1875. He died in London Jan. 12 1911, being succeeded in the title by his eldest son, Louis Samuel Montagu (b. 1869). His second son, Edwin Samuel Montagu (b. 1879), entered politics, and, after having been Under-secretary for India (1910-4), Chancellor of the Duchy of Lancaster (1915), Financial Secretary to the Treasury (1914-6) and Minister of Munitions (1916), was made Secretary of State for India in 1917. His fourth daughter, Lilian Helen (b. 1873), became a well-known social worker and was appointed J.P. for the County of London in July 1920.

SWEDEN (see 26.188)—The Swedish census of 1910 showed an increase since 1900 of 7.5%, from 5,136,441 to 5,522,403 inhabitants. The pop. on Jan. 1 1920 was 5,847,037 (2,868,305 males and 2,978,642 females), of whom 1,701,219 were living in cities, distributed as follows. Norrland (northern division) 1,018,009, Svealand (central division) 1,879,146 and Götaland (southern division) 2,949,882. The density of pop. is rather low; in Götaland 34, Svealand 23 and Norrland only 4 inhabitants per square kilometer. The chief towns with a pop. exceeding 20,000 inhabitants (Jan. 1 1920) were Stockholm (415,201), Gothenburg (200,577), Malmö (111,931), Norrköping (57,377), Helsingborg (45,805), Gävle (36,092), Örebro (35,096), Eskilstuna (30,103), Västerås (29,530), Jönköping (28,875), Uppsala (28,041), Karlskrona (27,029), Luleå (26,300), Borås (23,941) and Lund (22,827).

The excess of births over deaths is low: 10.6 per 1,000 in 1910, 6.9 in 1915 and 5.2 in 1919. The birth-rate for 1919 was 19.6 per 1,000. There were 24,704 emigrants in 1906, 27,816 in 1910, 7,512 in 1915, 10,571 in 1916, 6,440 in 1917, 4,853 in 1918, 7,337 in 1919. During the war emigration was naturally difficult. The immigration figures were: 6,357 in 1915, 6,713 in 1916, 5,811 in 1917, 4,932 in 1918, 7,809 in 1919. The United States received the largest contingent of the emigrants, but Norway, Denmark and Canada also received considerable numbers. Swedes resident abroad number between 2,120,000 and 2,245,000, of whom 1,500,000 are in America and 370,000 in Finland.

Occupations.—Agriculture, fishing and forestry provided 48.4% of the pop. with their livelihood in 1910; in 1900 the percentage had been 54.4, and in 1890 61.51, the decline having been progressive since 1840, when the percentage was 80.9.

Those dependent on employment in industry, mining, trade and communications represented 45.8% of the pop. in 1910, as against 38.8% in 1900, 31% in 1890 and 10.7% in 1840. Those following the so-called "free crafts" (*fria yrken*) or engaged in the public service (*allmän tjänst*) represented 5.8% in 1910 (6.8% in 1900, 7.5% in 1890 and 8.4% in 1840). The most significant feature in this de-

velopment is the increased importance of the industrial section. The census figures for 1920 in this respect were not available in 1921, but this section now represents half the population.

Agriculture.—Cultivated soil included 3,723,000 hectares in 1915, 1,715,000 hectares being used for grain, 1,411,000 for fodder stuffs, 26,100 for root crops, 3,000 for other crops, and 333,000 being left fallow. Gardens in 1915 occupied 47,533 hectares. The total value of the harvests in 1914 was estimated at 1,112,000,000 kr. and in 1920 at 2,012,000,000 kronor. The annual consumption of wheat increased from 47.7 kgm. per person in 1891 to 87.8 in 1915. The consumption of rye diminished from 110.6 in 1891 to 98.1 in 1915. The country's own production of corn has not been sufficient, and large supplies have been imported. During the decade previous to the war about 50% of the wheat was imported, and from 10% to 15% of the rye. The ease with which corn could be imported militated against all attempts to make the country self-supporting in this respect, and efforts came to be concentrated on stock-raising. The number of horses in 1916 was 701,099, of cattle 2,913,159, and of pigs 1,065,396. It was the agricultural policy of the country before the war to import a considerable amount of the corn required and large supplies of maize, oilcakes and other fodder stuffs, and in their place to export live stock, butter and cheese. The balance was not in Sweden's favour if seen merely from an agricultural standpoint. In 1913 there was an exportation surplus for live stock of 16,500,000 kr. and for butter and cheese of 46,700,000 kr., but there was an importation surplus for other animal products of 25,400,000 kr.; for grain, potatoes and seed corn of 58,600,000 kr.; for fodder stuffs of 22,800,000 kr. and for manure of 14,810,000 kr. The balance showed an importation surplus of 58,300,000 kr. Some decades earlier the country was as good as self-supporting, but the great industrial population has come into being since then and conditions of life have been radically changed thereby.

A more intense cultivation of the soil has been carried out with great energy. The splitting up of the land for the most part into small holdings has been a disadvantage to a certain extent. The large farms lead the way, and in localities where modern methods of agriculture sufficiently prevail the small farmers join together in cooperative societies. The scientific study of plant-growing and of manures is carried on in different parts of the country under the guidance of a central institute in Stockholm. Seeds have been greatly improved under the influences of the seed society in Svalöv (in Skåne), which also exports seeds. The Swedish moss cultivation society, which has its headquarters in Jönköping, has taken the lead in the systematic cultivation of the country's wealth in bogland.

Fishing contributes considerably towards the support of the population. The value of a year's catch may be estimated at between 20,000,000 and 30,000,000 kronor. Export of fish provides a balance of gain to the country of some millions of kronor a year. During the years of the World War measures were taken to promote the consumption of fish in Sweden itself.

Forestry.—Out of Sweden's total land area, which amounts to 41,000,000 hectares, 21,400,000, or nearly 52%, constitute forest-bearing land, whereas about 4,900,000 hectares, or 23.1%, are public property. In 1913 the output of sawed or planed timber was estimated at 7,800,000 cub. metres, mechanical wood pulp 326,000 tons, chemical wood pulp 860,000 tons, charcoal 4,300,000 cub. metres, and other products 18,500,000 cub. metres. In the same year the exports of plain sawn and planed wood were valued at 186,900,000 kr., of partly worked wood at 28,600,000 kr., and of wood-pulp at 99,700,000 kr., or 315,200,000 kr. altogether. These exports amounted to 38.6% of the total exports of the country. In certain years the exports of the products of the forests have amounted in value to half the total exports of Sweden. The economic world crisis after the war naturally caused a great diminution in export.

Industry.—Sweden is also rich in iron ore, and her water-falls make her well equipped for industrial enterprises. But coal is to be found in only one province, Skåne, and she is obliged to import large supplies of both coal and coke. The great distances for transport, moreover, entail heavy freight costs. Workmen enjoy a correspondingly high standard of living.

In 1915 the products of manufactories and mines had a value of something over 3,000,000,000 kronor. The extent to which Swedish industries had developed may be seen from the fact that the amount of horse-power in machinery per 1,000 workers had increased to 3,532 in 1915, from 2,841 in 1911 and 1,980 in 1906. The most important wood-sawing industries are found on the coast of Norrland, notably around Sundsvall and Härnösand. The timber is floated down the big rivers from the forests. Paper pulp is one of Sweden's most important exports. Paper is another. The exports of mechanical wood-pulp (dry weight) in 1915 amounted to 150,103 tons, of which 80,783 went to Great Britain. In the same year Sweden exported 721,786 tons (dry weight) of chemical paper-pulp, of which 298,056 went to Great Britain. The iron industry is to be found within a broad belt of land nearly level with Stockholm and a little farther to the north. The use of charcoal has helped to make practicable the manufacture of Swedish high-quality steel. In 1915 there were 135 iron-works (with 28,868 workmen), of which 78 had in all 120 furnaces in use, producing 748,928 tons of pig-iron and 11,773 tons of castings. The exports of iron and steel in 1915 had a value of 97,600,000 kr., as compared with imports of 27,800,000

kronor. Foundries and mechanical engineering works in 1915 had an output of 339,600,000 kr.; exports were valued at 115,600,000 kr., as compared with imports of 41,400,000 kronor.

During the war some industries thrived exceedingly, as, for instance, those of iron, paper-pulp and paper, others suffered appreciably at times from the lack of raw materials, as, for instance, the textile industry. During the second half of 1920 and in 1921 industry was hit hard by the economic crisis.

Commerce.—Sweden's foreign trade in 1910-20 presented a curious picture, inasmuch as the value of her exports during the war period exceeded that of her imports. In 1910 her imports amounted to 669,200,000 kr. and her exports to 592,900,000; the corresponding figures for 1914 were 726,900,000 and 772,400,000. The figures for the subsequent war years were as follows: 1915, imports 1,142,500,000 kr. and exports 1,316,400,000 kr.; 1916, imports 1,138,600,000 kr. and exports 1,550,400,000 kr.; 1917, imports 758,600,000 kr. and exports 1,349,600,000 kr.; 1918, imports 1,233,300,000 kr. and exports 1,350,400,000 kr. After the war the picture changes. In 1919 the figures were, imports 2,534,000,000 kr. and exports 1,575,700,000 kr.; in 1920 imports 3,373,500,000 kr. and exports 2,293,600,000 kr. It will be noted how goods were regularly drawn out of the country during the war, while the imports were inadequate. The circumstance that home-grown wood was to a great extent used instead of imported coal also counted. When the war came to an end the country lacked reserve stocks and needed many articles of consumption. Importation increased, in part on speculative lines, from Germany and Russia, and with results which for the most part were unfortunate.

It may be interesting to give figures illustrating Sweden's commercial relations with the leading belligerent Powers. In 1913 imports into Sweden amounted to 846,500,000 kr.; exports from Sweden to 817,300,000. Her imports from Great Britain amounted to 206,800,000 kr. and those from Germany to 280,900,000 kr.; her exports to Great Britain amounted to 237,300,000 kr. and those to Germany to 179,100,000. Her transactions with Germany were somewhat in excess of those with Great Britain, but the latter country came first as purchaser of Swedish products. During the war a great reduction came. Imports into Sweden from Great Britain amounted to 183,800,000 kr. in 1914; 213,500,000 kr. in 1915; 164,400,000 kr. in 1916; 65,100,000 kr. in 1917; 148,700,000 kr. in 1918 and 668,900,000 kr. in 1919. Imports from Germany came to 238,600,000 kr. in 1914; 251,500,000 kr. in 1915; 420,200,000 kr. in 1916; 288,200,000 kr. in 1917; 447,900,000 kr. in 1918 and 269,100,000 kr. in 1919.

Exports to Great Britain amounted to 258,300,000 kr. in 1914; 329,600,000 kr. in 1915; 320,100,000 kr. in 1916; 216,100,000 kr. in 1917; 252,600,000 kr. in 1918; 509,900,000 kr. in 1919. Exports to Germany came to 174,800,000 kr. in 1914; 486,400,000 kr. in 1915; 437,500,000 kr. in 1916; 352,100,000 kr. in 1917; 292,800,000 kr. in 1918 and 130,800,000 kr. in 1919. During the war years British coal imports into Sweden declined, and Germany largely made good the deficiency, being naturally anxious to secure imports from Sweden. The figures for the Swedish importation of coal and coke, in thousands of tons, during the years 1913-7 were: from England, 4,916, 4,683; 2,816; 1,707 and 604; and from Germany, 431, 335; 2,174, 4,281 and 1,708. It will be seen how energetically Germany came forward in Great Britain's place as exporter to Sweden.

Shipping.—The Swedish commercial fleet in 1910 included 1,214 steamers and motor-boats, of 842,460 total tonnage dead-weight; in 1915 1,278 vessels, of 984,799 tonnage; in 1918 1,238 vessels, of 894,260 tonnage. The figures for sailing vessels were in 1910 1,635, of 204,624 tonnage; in 1915 1,422, of 161,650; and in 1918 1,295, of 141,306. The diminution was due partly to war-losses.

Communications.—The Swedish railway system had in 1910 a length of 13,829 km., and in 1919 of 15,154, whereof 4,418 and 5,496 respectively were State railways. Through the thinly populated inner region of Norrland there runs a State railway line which has been opened for traffic between Östersund and Vilhelmina. A single-line railway along the coast of Norrland has been planned out and begun with aid from the State. During the war the railways were sometimes quite overloaded, so that locomotives could not be repaired to the extent they needed, and lubricants and good coal ran short. The increased costs drove up passenger and goods rates.

During 1909-16 the Trollhätte canal was reconstructed and deepened to four metres. The Södertälje canal was in 1921 in process of reconstruction and of deepening to five metres. Through the former operation navigation was made possible to the great Lake Venner and thus between Gothenburg (Göteborg) and the Western mining district, and through the latter a good waterway was being created to the harbour of Lake Mälär.

Social Conditions.—Democracy has a strong hold on the Swedish people, owing to the high degree of education reached by the masses and to their inherited respect for the sanctity of law. Familiarized from an early date with self-government, Sweden had begun already in the closing decades of the 19th century to build up a kind of network of nonconformist religious associations, Anglo-Saxon in their character, temperance unions and friendly societies. When, as the outcome of advances in industrialism, the labour movement began to take shape, it was able to utilize these habits of organization and thus secure a position of considerable power comparatively quickly.

Now more than 60% of Sweden's wage-earners belong to trade unions; at the beginning of 1921 these had over 400,000 members, of whom 280,000 combined to constitute the so-called "Lands Organisationen," which may be translated as "The National Organization," while simultaneously the political side of the labour movement, Social Democracy, became a force of the first order. Swedish Social Democracy has relied more and more on parliamentary methods of reform, thereby awakening opposition on the part of the labour extremists, with the result that in 1917 a new Socialist party of the left came into existence, formed for the most part of young men, a large number of whom were strongly influenced by Russian Bolshevism. In the spring of 1921 these latter formed a Communist party connected with the Third International in Moscow. The bulk of Swedish workmen, however, hold aloof from revolutionary tendencies, thanks to the great extension which has been attained by cooperation. While workmen constitute a typical class party, another class party formed by the association of farmers and countryfolk, under the title of the "Böndeförbund," dated its origin from 1917.

In 1913 a law was passed instituting compulsory old-age and disablement insurance for the entire population. In 1916 a similar accident insurance law was passed. The law passed in 1919 for an eight-hour day was the most advanced of any in Europe. The national administration includes a special social department, as well as a number of boards for dealing with social questions.

The communes also, especially the large towns, have instituted important social reforms; for instance, by creating public labour exchanges, which have been State-endowed since 1907 and are under State guidance and control. In common with the State, moreover, the communes contributed to the general pensions insurance. The guardianship of the poor used to rest on the primary communes, but, through a new Poor Law, passed in 1918, this burden is now in certain cases transferred to the provincial assemblies (Landsting) and the State.

The first decade of the 20th century was marked by the creation and swift growth of employers' associations (notably that known by the name "Svenska Arbetsgivare Foreningen," whose members in 1920 employed nearly 300,000 workmen) and also of associations of landowners; and in several great conflicts, as, for instance, in a five-weeks' general strike in the summer of 1909, in which 300,000 workmen took part, the victory fell to the employers. For a long time the State's only action in the matter remained the passing of a law in 1906 for the intervention of a Conciliation Court in labour disputes. By reason of the high standing, however, of the trade-union organizations, and as the result of frequent collective agreements on both sides, certain conventional methods of treaty came into vogue in the field of labour disputes. In 1920 the Riksdag passed a law instituting a central State conciliation and arbitration court, as well as local courts of the same kind, to pronounce judgment in labour disputes on the basis of their collective agreements.

The Liquor Question.—For close on a century past the alcohol question in Sweden has been a subject for the most serious consideration and for constant measures of reform. The unhappy results of the excessive consumption of gin at the beginning of the 19th century called forth an energetic temperance movement, led by a clergyman named Peter Wieselgren (1800-1877), a "donipröst," or dean, of the Lutheran Church, and in 1855 a law was passed which abolished the right to manufacture gin for home consumption and which granted concessions to companies, with no financial interest in the traffic, to sell alcoholic drinks under public control. This "Gothenburg System," as it was designated, brought about considerable improvements in many respects, and the great temperance societies, with a total membership of 450,000, have worked in the same direction. It was, however, only by the new law regarding the sale of liquor which was passed in 1917, and which came into force in 1919, that the underlying principle ("disinterested management") of the Gothenburg System was consistently put into general practice. By this law the selling to individuals of drinks containing more than 3.6% of alcohol was confined exclusively to the so-called "systembolag" ("system company"), with about 150 branches, over the management of which the State authorities have decisive control and which pays over all its profits to the State Treasury except for 5% interest on the capital invested. The controlling of this "system company" is entrusted to a central institution known as "Kontrollstyrelsen." All persons who wish to purchase such liquors for home consumption are registered and receive a pass-book; the total amount of liquor allowed to them being limited to a maximum of four litres a month. The abuse of alcohol is attended by further restrictions or by the absolute withdrawal of the right to purchase. The amount of liquor which may be sold to a customer in a restaurant is also strictly limited and confined to meal-times. This system of liquor-dealing, which was set on foot in Stockholm in 1913 and organized by Dr. Ivan Bratt (coming to be known as the Bratt system), was supplemented by a special measure regarding the treatment of alcoholists. The system had remarkable results, proportionate in large degree to the activity of the leading members of the various companies. The consumption of spirits decreased in many places, for instance in Stockholm, by nearly 50%. The number of cases of drunkenness, which was formerly somewhat high, was reduced throughout the country—in Stockholm and in cer-

tain other places by 60%—and so was the number of persons suffering from alcoholism. Much opposition from the side of those who regard the restrictions introduced as altogether excessive was brought to bear against the system; on the other hand, a tendency arose among the temperance associations to believe that total prohibition was the only way towards the solution of the alcohol problem. Smuggling and illegal manufacture of spirits developed to a disquieting degree in the years 1917-8. There were signs, however, in 1921 of a return to a better state of things.

Finance.—In 1910 the state budget amounted to 265,200,000 kr., in 1915 to 415,400,000, in 1920 to 929,400,000, and in 1921 to 1,131,100,000. For 1920 and 1921 the so-called "tilläggsstater," i.e. supplementary military budgets, are included. The tax revenue in 1921 amounted to 579,200,000 kronor. The consolidated national debt amounted at the end of 1920 to 1,280,600,000 kr.; in 1910 it had been 543,400,000 kronor.

Apart from the national bank, the Riksbank, which alone issues bank-notes, there were in 1910 17 private and 63 joint-stock banks, which in 1920 had decreased to 11 and 30 by amalgamations. Their total paid-up capital and reserve funds amounted in 1910 to 562,600,000 kr. and in 1920 to 1,084,000,000 kronor. At the end of 1920 the Riksbank balanced its revenue and expenditure at 1,017,500,000 kr. and the other banks' balance stood at 7,662,300,000 kronor. The leading private bank is Stockholm Enskilda Bank; the largest joint-stock banks are Skandinaviska Kreditaktiebolaget, Svenska Handelsbanken (formerly Stockholms Handelsbank) and Aktiebolaget Göteborgsbanken.

The circulation of paper money increased from 206,500,000 kr. in 1910 to 790,900,000 kr. in 1920. During the war years the Riksbank was relieved from its liability to meet notes with gold, and also to receive gold in ingots (see EXCHANGES, FOREIGN).

The Swedish savings banks in 1919 numbered 477; their deposits amounted to 1,870,800,000 kr. and their capital to 107,100,000 kronor. The post-office savings bank, a State institution, had deposits amounting to 84,400,000 kr. at the end of 1920.

Constitution.—The Swedish Parliament, the "Riksdag," consists of two elected Chambers, the First Chamber being composed of communal representatives. A constitutional change of a radical kind took place in 1907 and was confirmed by the Riksdag of 1909. The communal suffrage was on a scale proportionate to income, the graduation was now limited so that no person could have more than 40 votes, the bulk of the middle classes thus acquiring a preponderance. Absent voters could delegate their voting rights to others. Women had the communal suffrage in proportion to the degree in which they themselves were liable to taxation. Proportional representation was introduced in the case of both Chambers. Members of the First Chamber, in common with those of the Second, were paid. The suffrage in the case of the Second Chamber became universal and remained, as before, equal for all.

By Riksdag resolutions in 1918, 1919 and 1921 the constitution was further developed in a markedly democratic direction. Under these reforms the First Chamber consists of 150 members, elected by proportional representation by the provincial assemblies, i.e. either by "Landstingen" or by specially formed bodies of electors, chosen also by proportional representation by those possessing the communal suffrage. The communal suffrage is universal and equal; it is no longer graduated and it is personal. When it was graduated in proportion to income, business companies possessed the communal suffrage. Anyone who fails to pay his taxes for three successive years forfeits his right to vote. Women have the same voting rights as men. The age at which the voting right is acquired is 23, but the age is 27 for the right to vote for the members of the provincial assemblies which elect the First Chamber. The right to vote by proxy is abolished, but a husband may deliver a wife's vote in a closed envelope, or a wife a husband's. Similarly, in the case of both the communal elections and the elections to the Second Chamber, soldiers on active service, absent seamen and fishermen, and employees of railways, ports, customs and pilot services may send in their votes by post.

The number of the voters in the communes has been more than doubled. After the reform the communes' lists of voters contained nearly 3,300,000 names, i.e. more than 56% of the pop., and of these about 1,600,000 were men and 1,700,000 women. In March and April 1919 took place the new communal assembly elections. In two 'Landsting' out of 25, and in 20 towns out of 107 (among them Stockholm), the Social Democrats and Socialists of the Left together won absolute majorities. In ten 'Landsting' and 38 towns the Social Democrats were the strongest party. The election periods are eight years for the members of the First Chamber, one-eighth of whose number are elected each year; and four years for the Second Chamber's 230 members, who are all elected at one time. Women as well as men are eligible as members of both Chambers. The age at which a person becomes eligible for the First Chamber is 35, for the second 23. To be eligible for the First Chamber a person must have a certain specified income or property. If a member can no longer perform his duties, his place is taken by a substitute elected at the same time as himself. The Riksdag is called together every year on Jan. 10 for its ordinary meeting.

In 1921 the Riksdag passed an Act to provide that a consultative referendum shall be had recourse to when the Government and the

Riksdag think it desirable to take the opinion of the people direct by plebiscite on some important question before its decision by the Riksdag. The proposal decided on must be submitted once again after a new Second Chamber election before it becomes binding. Another constitutional change was involved in the creation of a foreign affairs committee, which the Riksdag shall elect every year, and with which the Government shall take counsel regarding foreign affairs. The Riksdag's right to share in decisions regarding agreements with foreign countries has been extended. Yet another constitutional novelty is the right given to women to hold office under the State where no special hindrance lies in the way.

HISTORY.—On the death of King Oscar on Dec. 8 1907 he was succeeded by his eldest son Gustav V. Rear-Adml. Arvid Lindman had been at the head of the Government since May 1906, with Erik Trolle, former Swedish minister at Berlin, as Minister of Foreign Affairs; Carl Swarta, a manufacturer, as Minister of Finance; Maj.-Gen. Lars Tingsten as chief of the Department of National Defences, and Alfred Petersson i Påboda, a landowner, as Minister of Agriculture. In 1907 this Ministry had carried a measure of constitutional reform, embodying universal suffrage in regard to the Second Chamber and proportional representation in regard to both Chambers; and this measure, in accordance with statute, was confirmed by the Riksdag of 1909 after the election of members of the Second Chamber in the autumn of 1908. Owing to a divergence of opinion within the Ministry upon an important point bearing upon the extent of the Riksdag's powers, Trolle, Petersson and one other minister resigned in 1909. The new Foreign Minister was Count Arvid Taube, who had succeeded Trolle as representative of Sweden at Berlin. Some time afterwards Maj.-Gen. Tingsten also resigned. Moderate Conservatism was the note of this Ministry. The ministerialist party in the Riksdag had a majority in the First Chamber and a minority in the Second.

The National Defence Question.—At this period the problem of national defence was in the forefront of Swedish politics, inasmuch as the foreign affairs of the country were in a condition calculated to arouse anxiety. The union with Norway had been dissolved in 1905 and Sweden now stood alone in respect to foreign politics. Finland, which in 1809 had been taken from Sweden and united to Russia, had been having its autonomy more and more reduced, and Russia's foreign policy seemed to show a forward tendency westwards. A great variety of new military measures in Finland seemed to point to something more than a desire on the part of the Russian Government to prevent a German invasion of Southern Finland in the event of a Russo-German war. Right up to the north of the Gulf of Bothnia a network of railways was being spread out for military purposes, and new strategic lines were constructed of a kind necessitated neither for purposes of defence against Germany nor for purposes of trade. Barracks sprang up at the railway junctions. In Sweden Russian spies were ubiquitous, and a Russian military attaché had to be recalled on the ground of having pushed inquisitiveness beyond all limits. A handbook was produced for the use of the Russian military service containing information about the conditions of life in Sweden, and with Swedish maps in it, as well as a short vocabulary of military terms in Russian and Swedish. Swedes had an uncomfortable feeling that the attention of Russia was being directed altogether too closely upon their inadequately defended country.

A careful enquiry into the question of national defence had been undertaken in 1907. The Liberal members of the committee of investigation which was appointed were dissatisfied with its estimate of the defence expenditure required, and signified their attitude by withdrawing from it in 1910. This militated somewhat against the efforts of the committee, and it proved to be impossible, as had been intended, to submit a new scheme of national defences to the Riksdag of 1911. Instead of this, the Government brought forward a proposal for a new naval programme, and, in the face of opposition from the Liberals and Social Democrats, carried a bill, as a first step, for the construction of a powerful new battle cruiser.

Liberals in Office.—In Sept. 1911 the general election for the Second Chamber of the Riksdag, under the reformed methods which had almost doubled the electorate, resulted in increasing

the strength of the parties of the Left. The Liberals elected numbered 101, the members of the Right numbering 65 and the Social Democrats 64. Admiral Lindman's Ministry resigned, and in Oct the King entrusted Karl Staaff, who had been prime minister in 1905-6, with the task of forming a new Government. This Ministry remained in office until Feb 1914. Count Albert Ehrensvard, previously Swedish minister at Washington, became Minister of Foreign Affairs, and both of the departments of national defence were placed under civilians, in accordance with the Liberal view that there should be greater civil control. Alfred Petersson, who had gone over to the Liberals, became once more Minister of Agriculture. The question of national defence again came up for treatment, but upon different lines and almost exclusively at the hands of the members of the Left. It had not been possible to proceed further with the projected new ironclad than the making out of the designs. The Government proposed to the Riksdag of 1912 that the project should be abandoned and the Riksdag agreed. This cancelling of a previous decision of the Riksdag, on account of the new elections having altered the composition of the Second Chamber, evoked strong dissatisfaction. Within a brief space of time a sum of 17,000,000 kr. was raised by voluntary subscription for the building of the ship, and since the Government was unable to decline to use this fund the keel was laid down on Dec. 1. The whole country was now stirred up, and further sums were subscribed in the same way to furnish machine-guns for the Landsturm and to provide aircraft. Towards the end of 1913 things had come to such a point that the prime minister was able in the course of a speech to advance arguments in favour of a forthcoming proposal for a winter training for the army, the establishment of reserve forces, the levying of a higher war-tax on the more well-to-do, the amelioration of the laws governing war, etc. But in view of the election promises to which the Liberal leaders had committed themselves during the contest of 1911 this programme was not to be submitted all at once; its most important item alone, that of the training of the infantry, would in the first place be submitted by itself on the occasion of the Second Chamber elections of 1914 before being proposed to the Riksdag. The public discussion of the matter became very lively, and although no thoroughgoing defence programme was in fact submitted to the Riksdag of 1914, violent feelings were aroused and expressed.

At last even the small farmers and peasantry, usually anything but enthusiasts for defence measures owing to the heavy personal taxation entailed, were drawn into the movement. On Feb. 6 1914 there was a great meeting in Stockholm of more than 30,000 representatives of this class from all parts of the country, assembled for the purpose of bringing home to King Gustav their anxiety at not seeing the question handled promptly and in its entirety. They were received by the King in the great courtyard of the Royal Palace, and their spokesman declared that the Swedish people were willing to bear the burden of whatever measures of defence were necessitated by the gravity of the time. The King answered that he, too, was of opinion that the problem called for treatment in its entirety and without delay.

This demonstration had important consequences at once. The Ministry had had no previous intimation of what the King was going to say, and matters were brought to a head by the resignation of Staaff and his colleagues. On Feb. 17 a new Ministry was formed, with Iljalmr Hammar skjöld as its head.

Policy of Reform.—In connexion with foreign affairs during this period it may be added that, by arbitration at The Hague, the sea boundary between Sweden and Norway was fixed in accordance with Sweden's claim, and Sweden became a party to the North Sea and Baltic Agreement of 1908. By dint of close co-operation between the Government and the Riksdag a large number of important reforms were instituted. Among those carried through during Adml. Lindman's administration may be mentioned (in addition to the franchise measures above noted) the creation of a supreme administrative Court of Justice (*Regerings rättsen*), together with a legal council, formed of some members of the Supreme Court, as advisers to the Government in legislative matters. Civil marriages were made permissible

for all members of the State church. New laws were introduced as to farmers' tenancies and the leasing and letting of houses, flats, etc., and the speculative operations of the big companies dealing in land in Norrland were restricted and placed under control. A new company law was passed by the Riksdag and also a new banking law. A progressive income and property tax, based on the taxpayer's own statements as to both, was also introduced, together with a progressive inheritance tax. Custom-house duties were remodelled and the sugar-tax modified. An arrangement was come to with the Grängesberg Co. in regard to its iron-ore business in Lapland, by which the complicated question of proprietorial rights was so settled that the State joined in as part owner, receiving preference shares to the value of 40,000,000 kr., a specified royalty on the proceeds of the mining at Gellivara and Kiruna and the right of redemption after a specified period. Large grants were made to the electric power stations at Trollhättan and Älvkarleby in central Sweden, as well as to that at Porjus in an uninhabited region of Lapland, and a widening of the Trollhätte canal was put in hand. A new law regarding insurance against illness was passed. Night work in certain occupations was forbidden for women. Improvements were made in higher technical education. In 1909 a sharp conflict arose between employers and workmen, and the latter organized a general strike in which nearly 300,000 took part. There were, however, no disturbances, thanks both to the discipline maintained and to the wise measures adopted by the Government. Social life was not brought to a standstill, as the workmen expected, and after a lapse of two months the conflict was brought to an end.

While the reforms introduced by Adml. Lindman's Ministry lay mainly in the sphere of economics and industry, the Staaff Ministry devoted its energies more especially towards social questions. A new social department was instituted, as a centre for the State's activities in this direction. The law bearing on the protection of workmen was extended, and various forms of workmen's unions were placed under control. A law was passed regulating the methods of dealing with alcoholists. The profits of the sale of spirits by the communes were allocated to the State, compensation being allowed therefor, the object of this being to free the communes from all economic interest in the liquor trade. After long preliminary planning, an illness and old age pensions insurance law was passed, enacting obligatory insurance, with payments in three degrees, for all, except pensioners of the State, between the ages of 16 and 66, the pensions to be given in case of illness, or on the completion of the 67th year.

The War Years, 1914-8.—In the ministry which Herr Hammar skjöld formed in Feb. 1914 Herr K. A. Wallenberg, the banker, was Minister of Foreign Affairs; Herr Dan Brostrom, shipowner, Minister for Naval Defence, and Herr Oscar von Sydow was Minister of the Interior. The Second Chamber was dissolved, and after a very sharp contest the advocates of active defence measures were returned in increased numbers, but without having secured a majority, polling 86 seats out of 230, while the Liberals numbered 71 and the Social Democrats 73.

The Riksdag met again in May, and the outbreak of the war brought with it a solution of difficulties, inasmuch as all parties recognized that there must be no disputing as to details of defence at a moment when the whole surrounding world was aflame. Universal military service had already been introduced, but now the training time for infantry was increased to 340 days, of which 250 were to be spent in recruit classes beginning in the autumn and continuing throughout the winter, followed by the usual training courses during three years. In order to secure non-commissioned officers of the right kind it was judged well to impose a longer training time, extending to 485 days, on students and other young men of similar standing, while for cavalry and artillery the period was fixed at 365 days. Large sums were allotted for the provision of war materials and for the strengthening of the coast defences. A programme was drawn up for adding new vessels to the fleet. Simultaneously with these steps towards increasing the defences of the country, measures were introduced for modernizing the existing code of punishments for military

offences, this being accompanied by the creation of a special official, to be appointed by the Riksdag, whose duty it would be to inquire into all allegations regarding abuse of power or other derelictions on the part of superior officers in the army or navy—an appointment designed to act as a protection for soldiers and sailors against injustice.

An official declaration of neutrality was published without delay, and all the ministries holding office during the war, with the Riksdag's expressed approval, aimed at remaining absolutely neutral. Neutrality involved the duty of preventing any of the belligerent Powers from using Swedish territory as a base for operations against enemies. Throughout the entire war the Swedish fleet remained on guard along the coasts of the country and on several occasions it had to take active measures. During the summer of 1916 there were many violations of neutrality in Swedish waters. In order to elude the observation of foreign battleships, trading vessels, flying the flags of belligerent countries, or carrying dangerous freights, sought to get through a channel called Kogrundsranan within Swedish waters in Öresund, and apparently frequent attempts were to be expected on the side of belligerent countries at both ends of this channel to seize enemy vessels even at the risk of this occurring within Swedish waters. This channel was closed therefore against all but certain known Swedish vessels. The Allied Powers considered this action incorrect and protested, but the channel remained closed until Dec. 1918. A number of trading vessels belonging to the Allied Powers, which, owing to the closing of the channel, were confined in the Baltic, were, however, allowed egress on the condition that the Swedish population received a certain measure of necessary supplies from the west.

The stagnation produced by the outbreak of the war as regards foreign trade and shipping did not last long. Sweden became for a time, like Holland and Italy, an intermediary in the American trade with Germany, quite in accordance with international law as it stood before the war. When, however, the Allies proceeded to employ more and more stringently their weapon of blockade against the Central Powers this business as intermediary came quickly to a stop. The intensifying of the war at sea brought with it great obstacles in the way of neutral commerce. Its most painful feature was the sinking of neutral vessels by the German submarines, with its accompanying loss of lives. The mines which were spread about by other groups of belligerents also claimed many victims. The proceedings of the submarines called forth much indignation, and protests were made, but without much effect. The measures of the Allies were of a different order, but their control over shipping presently became so oppressive that protests against this also were made, the weightiest protest coming from the three northern kingdoms acting together. Sweden's geographical position and the commercial conditions which existed before the war necessitated the maintaining of relations with both sides. Trade transactions with Germany were in 1913 somewhat in excess of those with Great Britain, but Great Britain was the larger purchaser of Swedish products. During the war one great displacement in trade resulted from the diminution of Sweden's imports of coal from Great Britain and the consequent necessity of making good this diminution by imports from Germany.

Despite all the difficulties to be encountered it proved possible to maintain importation into Sweden from the west of raw materials, grain and other necessities down to well on in 1916, but from this time onwards there was an increasing scarcity. When the Allies intensified their blockade, and Sweden could not break off trade relations with Germany, the blockade-line was drawn not between Sweden and the Central Powers but west of Sweden and the other Scandinavian countries. All goods which had to pass the blockade-line in the North Sea on the way to or from Sweden were subjected to sharp control. As regards goods from Sweden certificates of origin and ownership had to be furnished, to make sure that they were not in reality disguised exports from Germany, while in the case of goods for Sweden guarantees were required to the effect that they would not be forwarded to Germany. Suspected goods were unloaded in

British seaports. Black lists caused serious losses to conscientious tradesmen as well as to others. Both groups of belligerents set on foot elaborate systems of trade espionage in neutral countries. In order to regulate the undertakings which the belligerents demanded from merchants, manufacturers and shipowners, the so-called War Trade Law was passed in 1916 to give legal value to officially recognized undertakings to foreign Powers, while at the same time it was laid down that undertakings not thus recognized lacked all legal value. A special trades commission was created to investigate all questions connected with this matter. The international goods exchange came to be worked like an enormous system of compensation, controlled by State officials by means of agreement. Every neutral country had to offer some equivalent in return for its imports. During the first years of the war it was to the interest of the Allied Powers that goods should go through Sweden to Russia. The great consignments caused inconvenience to the Swedish railways, but they made things easier for Sweden in the matter of imports.

Negotiations were set on foot for a commercial agreement between Sweden and Great Britain and her Allies, but they led to no result during the time of Herr Hammarskjöld's Ministry, and this fact was turned to account against him in the political conflict which went on over the internal affairs of the country. After this Ministry resigned on Mar. 1 1917, and Herr Carl Swartz formed a new Government, the Foreign Minister, Adm. Lindman, brought about a temporary agreement by which the Swedish people were allowed the right to import nearly 92,000 tons of grain and about 40,000 tons of other goods, on the condition that certain vessels belonging to the Allies then confined in the Baltic should be allowed egress through the closed channel of Kogrund.

After Herr Eden's Ministry succeeded to that of Herr Swartz in the autumn new discussions were entered upon in regard to imports. In Feb. 1918 a so-called *modus vivendi* agreement was come to, enabling Sweden to import about 75,000 tons of maize, feeding-stuffs, raw phosphate, mineral oils and coffee, and in June a more comprehensive agreement was reached, in accordance with which it was possible to import larger quantities of grain, feeding-stuffs, coal, oils, india-rubber, cotton, wool, hides, etc. In this connexion Sweden placed at the disposal of the Allies a portion of her commercial fleet. In addition, Sweden guaranteed to the Allies a certain share in her iron-ore exports, and also undertook to allow a certain amount of credit for goods bought in Sweden. In this way Sweden's most essential import was made sure of until the end of the war. In consequence of the universal scarcity the three Scandinavian countries came to an agreement as to the mutual exchange of commodities.

The hard conditions which prevailed during the war brought Sweden and Norway closer together again. After the severance between Sweden and Norway in 1905, and the election of a Danish prince as King of Norway, the relations between the Scandinavian countries had been somewhat cold. King Gustav, who at one time had been the Norwegian Crown Prince, himself took the initiative, and in Dec. 1914 invited the Norwegian and Danish monarchs to a meeting at Malmö, at which the affairs of the three countries as affected by the war came under discussion. Other such consultations followed, for instance at Christiania in Nov. 1917, and the prime ministers and foreign ministers of the three kingdoms also came together, while on some occasions of importance there were meetings at which special delegates were present.

In Jan. 1918 Sweden gave her recognition to the new Finnish State. When, shortly afterwards, the Red outbreak occurred in Finland, there was a strong movement in favour of Sweden's joining in on the side of the newly formed Finnish Government, but when the Russian troops began to take part in the struggle on the side of the Reds, Russia continuing to be a belligerent Power, the Government and the Riksdag agreed that it would not be wise to intervene. Swedish volunteers fought on the side of the Whites, and a couple of Swedish ambulances were sent over. Swedish refugees were brought back from Southern Finland. While the civil war in Finland was still in progress a petition came from the inhabitants of the Åland Is. for Swedish

protection against aggression on the part of Russian troops which were stationed there. Troops were sent from Sweden to maintain order on the islands, and they achieved their purpose. When Germany, however, came to the support of the Whites and landed forces on the Åland Is., the Swedish troops were withdrawn.

Economic Measures—At the very beginning of the war period the Swedish Government carried through several special administrative measures. The exportation of a number of commodities of great importance was prohibited, partly in order that they might be kept for home consumption, partly in order that they might control the exportation by export licences. This system was gradually developed until at last the export of *all* important goods was prohibited. An Industrial Commission and an Unemployment Commission were set up to decide on the measures which should be taken to maintain industrial work and to mitigate the serious condition of unemployment which threatened. A Food Commission was appointed to study the development of the market, and a National War Insurance Commission was charged with the task of dealing with insurances against loss of life and property through the war on the seas, as the private insurance companies were unable to undertake all the risks. The Riksdag's legislative powers were also called into play. A financial Moratorium was instituted at an early date. The Riksbank's obligation to meet its own notes with gold was suspended, and new laws were introduced giving the Government new powers, which were employed when necessary, to effect the compulsory purchase of goods from individuals and to fix maximum prices on commodities. Swedish vessels could not be sold to other countries without the Government's sanction, nor could they carry freight from one foreign country to another. All this accumulation of legal measures, which presently had added to it the law against unreasonable increases in rent, the law against "profiteering" and several others, did not come about at once but grew out of the needs which were created by the conditions of the war period. New organs for war-time administration were formed in the Trade Commission (June 1915) and the Food Control Commission (autumn 1916), the former of which had to apply the War Trade Laws and to supervise exports and imports, while the latter, as the successor of an earlier Food Commission, took in hand the food rationing of the country.

Rationing.—Before the war Sweden produced about four-sevenths of the cereals which she required; the rest had to be imported. On the other hand, she exported live cattle, pork and butter, the production of which was made possible by the importation of feeding-stuffs. The fodder harvest of 1914 was so scanty that it necessitated a reduction of live stock. The importation of cereals was undertaken by the State through the agency of the Food Commission. When there began to be a scarcity in some of the animal foods, and prices suddenly rose, recourse was had to the fixing of maximum prices for the first time in Nov. 1915. In the course of the year also the exportation of animal foods was restricted and producers were obliged, in return for the granting of export licences, to allot a certain proportion of their goods ("compensation goods" so-called) to the State for sale by the communal authorities at low prices to those who were less well-to-do. In the autumn of 1916 the scarcity of animal foods became so serious that rationing had to be decided on, and, even so, anxiety was occasionally felt lest the supplies should fail. The situation was aggravated later by the bad harvest of 1917. In Oct. 1916 it was decided that nobody should obtain sugar without presenting a sugar-card. These sugar-cards gave a person the right to purchase 13 kgm. of sugar a year, with an additional amount for preserving purposes to each family. In Jan. 1917 bread-cards were introduced. Farmers were allowed to retain a certain quantity of corn but had to sell all the surplus to the State. All such stores, whether bought by the State or imported, were rationed out to the rest of the population, who were given bread-cards providing at first allowances of 250 grammes a day to each person, later only 200 grammes, but again 250 in Nov. 1918. Persons engaged in particularly arduous work were allowed extra rations. The bread-cards were used also on journeys. The carrying out of this work of rationing needed very

thorough supervision, and this evoked dissatisfaction and annoyance, especially among the farmers. The system was changed in the food control year of 1918-9, each farmer being called upon to supply a certain specified quantity of corn and being allowed to do more or less as he pleased with what he had left. Rationing ceased at the end of Aug. 1919.

The supply of bread was scantier than in normal times, and it had to be supplemented with other food-stuffs, especially potatoes. The consumption of all these rose enormously and a great scarcity began to be felt, most severely in the late winter and in the spring of the year 1917 and 1918. People had to have recourse to the eating of turnips. In the spring of 1917 there were food riots in various localities. In 1918 the danger of famine became worse, but calm prevailed. In the autumn of that year potatoes also had to be rationed, but this expedient did not work well. In densely inhabited localities milk was so rationed that the needs in the first place of small children, then of pauper children and the old and the sick were supplied. The exportation of meat, including bacon and pork, ceased altogether in the first half of 1917. The scarcity of fodder became at times so intense that moss and heather and even pine-needles had to be employed as substitutes in the cow-sheds. The selling of bacon and pork was placed under strict control, but only with the result that both disappeared almost altogether from the open market. The rationing of butchers' meat was considered, but it was not thought safe to take this step. Among other things rationed was coffee. The scarcity of food generally caused the Government to do what it could to intensify production by the putting of new land into cultivation, etc.

The Fuel Question.—The fuel question was beset with difficulties although Sweden is so rich in wood. Before the war about 5,000,000 tons of coal and coke were imported, for the most part from England. When, during the war, the importation from England ceased, and Germany was unable to supply as much as England used to do, the country was faced by a very serious scarcity of fuel. This was at the beginning of 1917. The regulation of the business of the wood supply was then entrusted to the Fuel Commission, which put wood-cutting operations in hand on an enormous scale. In Nov. 1917 56,000 workmen were in employment at wood-cutting. Down to May 1918, when the work ceased for the most part, 19,400,000 cub. metres of wood had been cut. Forest owners were allowed to make provision for their own needs. Other households had certain specified quantities allotted to them, according to the number of persons in each, special wood-cards being provided and the price of the wood being fixed at figures which did not quite cover the cost. Those persons who wished to buy more could do so but at higher figures. Factories and railways had to pay higher prices. The result was that fuel was always available in sufficient quantities, but that the wood supply involved a loss to the State of over 100,000,000 kronor.

Industry during the War.—The importation difficulties reacted also upon industries. There was a great scarcity of lubricants. This was partly met by the use of substitutes. The textiles, rubber and leather industries, as well as several branches of the chemical industry, suffered from the lack of raw materials. The scarcity of copper and certain other metals and metal alloys had injurious results on the working of electrical machinery and generally throughout the whole sphere of mechanical engineering, but, on the whole, Swedish industries were kept going under favourable conditions. To deal with the importation of raw materials, which was controlled by the Allies, import associations were formed by the manufacturers who needed the raw materials in question. These associations furnished the guarantees required by the Allies and imposed corresponding guarantees on the delivery of the small quantities thus dealt out. The associations were controlled by the Trade and Industry Commissions. In cases where the supply of certain goods was exceptionally small the State laid claim to the whole, and a system of rationing was sometimes carried out by Raw Material Associations, formed by the manufacturers and craftsmen who were in need of them. In 1916 steps had to be taken in regard to regulations for the sale of

lubricants, iron pyrites, German iron, and hides, skins and printing paper. The first article to be appropriated by the State was linseed oil, next came hemp and india-rubber. In 1917 hides and skins were appropriated, as well as lubricants, leather shoe-soles, several metals, rails, paraffin, etc. Tickets for the purchasing of benzene for motor-cars and motor-boats were provided through the agency of the Industry Commission. All fat from the bones of mammals and all offal, etc., were turned to scientific or technical account. The use of carbide lamps increased swiftly, as carbide is a Swedish product. The Swedish iron-works and factories were constrained to supply iron goods at reduced prices to cultivators of the soil. In April 1918 rationing of wool began, as well as of cotton yarn, woollen or cotton stockings and woollen or cotton textiles and underclothing of these materials. Purchasing cards were supplied only where the need of them was genuine and "controlled." In Nov. 1918 the rationing ceased.

There was actually no very serious unemployment during the war. A great number of men who lost their work in the building and textile industries were employed in wood-cutting, clearance work in the forests, executing orders for supplies of stone for the communes, etc.

High Cost of Living.—High prices were the combined result of scarcity and the inflation of paper money. The prices of goods rose higher than in Great Britain, for example. Official investigations show that if a family which had an income of 2,000 kr. in 1914 sought to keep up the same kind of living its expenditure would have been increased to something over 3,000 kr. a year according to the prices which prevailed in May 1917, and to over 4,850 kr. according to those which prevailed in Oct. 1918. Wages had to be raised considerably. The State granted war bonuses which amounted in all to a sum total of 100,000,000 kr. a year. The State and the communes expended large sums also in subsidies. From Dec. 1916 down to the middle of 1920 the sum of 112,500,000 kr. was used for lowering the prices of food, clothes and fuel and, in some exceptional cases, rent, for the poorer classes. Of this amount the State provided 77,000,000 kr. During the first half of 1918 389,000 families, or 1,344,000 persons, benefited by purchasing goods at these lowered prices. The building industry was at a standstill almost entirely. The State took steps to help it but without much success.

Changes of Government.—At the beginning of the war all the burning questions of internal politics were put on one side, and all efforts were concentrated on solving the problems presented by the new condition of affairs. In the autumn of 1914 the new elections for the Second Chamber took place. The party of the Right remained unchanged in numbers, 86, the Liberals numbered 57 and the Social Democrats 87. Dissatisfaction with Herr Hammarskjöld's Ministry increased gradually, the Government—as always happens—being held to blame for the hardships of the times. The Opposition contended that the ministers showed a lack of diplomacy in their negotiations with Great Britain and that they had not paid due regard to the opinions of the Riksdag—certainly the cooperation between the Government and the Riksdag was not what it might have been. In March 1917 the Ministry resigned. In an address with 600,000 signatures Herr Hammarskjöld and his colleagues were urged to continue in office, but they persisted in their desire to withdraw. Herr Carl Swartz, who previously had been Financial Minister, formed the new Government, which was Moderate Conservative in character.

The Swartz Ministry, in which Adml. Arvid Lindman was again Foreign Minister, lasted only into the autumn. From the start it had borne the stamp of a stop-gap Ministry, inasmuch as the new elections were to be held in September. These went against the Right because, among other reasons, the prevailing hardships and the various measures of State interference were laid to their blame. The Right polled 59, the Liberals 62, the Social Democrats 86, while two new parties, the "Bondeförbund"—a league of farmers and countryfolk—and the Socialists of the Left came in with 12 and 11 respectively. The Ministry resigned and the King tried to arrange for a Coalition Government representing all parties. This effort proving un-

successful, the Liberal leader, Prof. Nils Eden, undertook the task of forming a Liberal-Social-Democratic Government. The prime minister himself, the Foreign Secretary, Herr J. Hellner, and five other members of the Government were Liberals; Herr Hjalmar Branting, the leader of the Social-Democratic party, was for a short time Finance Minister, Baron Erik Palmstierna, a former naval officer and a Social-Democratic member of the Riksdag, was Minister of Marine; there were two other Social-Democratic members of the Government, which adopted a Liberal-Radical programme.

After the War.—The Riksdag of 1918 passed, among their legislation, a new Poor Law and a new Education Law, reflecting the increased influence of the wage-earners. The wind of reform blew more and more strongly in the autumn. An extraordinary meeting of the Riksdag was called and very noteworthy decisions were come to, which were ratified by the Riksdags of 1919 and 1921, involving (see under *Constitution*, above) an immense democratizing of the administration. The consequences for the First Chamber showed themselves at once, when the Government dissolved it in the autumn of 1919 and the new election took place. The Chamber had been made up of 86 Conservatives, 43 Liberals, 19 Social Democrats and two Socialists of the Left. This was now altered to 38 Conservatives, 40 Liberals, 19 members of the "Bondeförbund," 49 Social Democrats and four Socialists of the Left. The greatest novelty lay in the women's vote and in their eligibility for both chambers of the Riksdag.

After the termination of the war in Nov. 1918 the emergency measures were almost entirely abandoned. The regulation of the bacon-and-pork-selling business ceased in Jan. 1919 and the rationing of potatoes in May. In Aug. bread-cards disappeared and the rationing of sugar also stopped on Aug. 1. Most of the industrial regulations came to an end during the first quarter of 1919. The Fuel Commission administration of the rationing of fuel terminated on March 1 of the same year. With the close of May the War Insurance Commission ceased its operation. The Riksdags of 1920 and 1921 renewed in modified form some of the emergency laws, but at the end of the first half of 1920 all that remained of the various Commissions were some small committees of liquidation.

When the League of Nations was still in process of formation the Governments of Sweden, Denmark and Norway appointed committees for the purpose of considering together their attitude towards it. The Swedish Government laid its proposal to join the League before the Riksdag of 1920. Opinions were divided; the decision was given in favour of accession by 86 votes against 47 in the First Chamber and by 152 against 67 in the Second. The Riksdag incorporated in this decision an expression of approval of the basic principles of the League, but formulated also its conviction that the Government should avail itself of every opportunity for urging that the States not invited at first to join the League should be incorporated in it as soon as possible; that a more satisfactory arrangement should be come to for the representation in it of the smaller States; that more definite rules should be framed for the meetings of delegates and for their methods of work, that the standing international tribunal should be constituted as soon as possible, and that its procedure in regard to mediation and arbitration should be more clearly defined and further elaborated, and also that efforts to bring about a universal and effective reduction of armaments should be set on foot without delay and vigorously pursued.

Sweden was represented at the International Labour Conference in Washington in 1919 and at that in Genoa in 1920, as well as at the League of Nations' first meeting at Geneva in 1920, when the Swedish delegates acted on the lines indicated in the Riksdag's utterance. In May 1921 the question between Sweden and Finland as to the sovereignty over the Åland Islands was settled by the League of Nations in favour of Finland (see *ÅLAND ISLANDS*).

Sweden did not formally recognize the Soviet Government in Russia, but at first a Russian representative was allowed to reside in Sweden to maintain the *de facto* relations between the two countries. In Jan. 1920 he was obliged to leave (but not until

Swedish residents in Russia had been enabled to return home) because of oppressive conduct in Russia towards Swedes and in regard to Swedish property. All trade relations were for a time broken off, but to an enquiry from the Allied Powers as to whether Sweden would take part in a blockade of Russia a reply in the negative was given. In 1920 permission was accorded to a Russian trade delegation to visit Stockholm. From the Russian side large orders for railway engines were placed with Swedish manufacturers, and much Russian gold passed through Sweden, mostly destined for America.

The Eight-Hour Day—Within the ranks of the Eden Ministry there was from the beginning a fundamental divergence of view between the Liberals and the Social Democrats, but for some time it was possible for them to work together. Moreover, this Ministry was the only one for a long time past which had a genuine majority, though a very heterogeneous one, in the Riksdag. The most important measure introduced in 1919 was for a legalized eight-hour day, but when first proposed it was rejected by the First Chamber. The Government dissolved the Chamber, and after the new elections an extraordinary autumn session was called at which the eight-hour day proposal was accepted. The Right had retained only 38 seats, the Bondeförbund coming back with 19, the Liberals with 41, the Social Democrats with 49, and the Socialists of the Left with three. According to this law, which was to hold good provisionally until the end of 1923, 48 hours in the week constitute work-time in industrial and other businesses in which at least four employees work at an employer's expense, agricultural work and forestry work excepted. As a general rule over-time must not be instituted to a greater degree than 150 hours in the year. A newly founded institution, the Labour Council, decides questions concerned with the carrying out of the law. A number of flaws were soon discernible in the law, and in the Riksdag of 1920 this Council applied to the Government to effect certain improvements. A proposal was laid before the Riksdag of 1921 and was in the main accepted. The modifications left the main principles of the law unchanged. Sweden subsequently declined to ratify the draft of the Washington Convention of the League of Nations on hours of labour, partly because it conflicted with the Swedish measure already passed, and partly because adhesion would be binding for 11 years, while the Swedish law held good provisionally for a shorter period.

The Social-Democratic Ministry—It was over the communal taxation question that the Eden Ministry went to pieces. This question had for a long period been under discussion, and it was intended to submit some proposal in connexion with it to the Riksdag of 1920. The Social-Democratic members of the Government asked for a definite settlement, while the Liberals wanted only a provisional solution. The end was that the entire Ministry resigned, and that the King invited the Social-Democratic leader, Herr Branting, to form a new Government. In March 1920 he did so. Baron E. Palmstierna, formerly Minister of Marine, became Minister of Foreign Affairs. All the ministers were Social Democrats. The new Government could only count on minorities in both Chambers as a regular Ministerial party. The discussion of the communal taxation question ended in a victory for the Liberal standpoint, a provisional arrangement. In the meantime the Ministry awaited the result of the general elections to the Second Chamber in the autumn of 1920. A comprehensive programme was put forward by means of commissions of inquiry into projects of socialization, industrial democracy, and the control of trusts and other great combinations.

Change of Ministry.—Dissatisfaction with the eight-hour day and with the socialistic projects brought a good many electors over to the party of the Right. The strength of the Social-Democratic party in the Second Chamber went down from 86 to 75, and the number of the Liberals was reduced from 62 to 47, while that of the Right went up from 59 to 70 and of the Bondeförbund from 10 to 29. The Socialists of the Left were reduced from 11 to 7, a result of their sympathies with the Russian Communists. Two members of the Chamber were "independents." The more than usually complex party conditions led the King to invite Baron Louis de Geer to form a non-political Ministry. Count

Herman Wrangel quitted the post of Swedish minister in London, in which he was succeeded by Baron Palmstierna, to become Minister of Foreign Affairs. The new Government began at once to occupy itself seriously with industrial, commercial and financial matters. Among other bills which it put before the Riksdag of 1921 was one for increasing the duty on coffee. On this being rejected Herr Tamm, the Finance Minister, resigned, and the prime minister, too, then resigned. He was succeeded by Herr Oscar von Sydow, former Minister of the Interior.

The Economic Crisis of 1920-1.—During the latter half of 1920 Sweden had entered on a grave economic crisis—her share of the general economic difficulties which prevailed after the war. The period from the dissolution of the union with Norway in 1905 down to 1914 has been characterized as one of great economic development. During and after the war cost of production rose swiftly, not least because the workmen, after the passing of the Eight-Hour Day Act, in most cases obtained higher rates of wages so that they could earn as much as when working longer hours. Compensation had already been allowed them for the increase in prices. As soon as importation possibilities became increased after the war, goods began to be imported to an extravagant degree, so that the country became flooded with them to the detriment of home industries. Finally the Swedish exchange, which stood somewhat higher outside than inside the country, facilitated importation but hindered exportation. When the international crisis came, with its swift fall in prices, it became necessary to lower wages again, but this brought the country up against great difficulties. In April 1921 about 60,000 industrial workmen were unemployed; in June about 90,000.

The Swedish Red Cross—Some account of the activities of the Swedish Red Cross must have its place in an outline of Swedish history during and after the war. King Gustav's brother, Prince Carl, played a leading role in this connexion, and also the Crown Princess Margaret (daughter of the Duke of Connaught), whose death in 1920 was sincerely mourned. The work of the Swedish Red Cross was directed more particularly to relieving prisoners of war in the various countries, above all in Russia on the one side and Germany and Austria-Hungary on the other. During 1915-8 a great number of invaded prisoners, including 3,617 Germans, 22,123 Austro-Hungarians, 428 Turks and 37,295 Russians, were brought homeward through Sweden by means of the Swedish Red Cross, specially equipped trains travelling between the Swedish-Finnish frontier in the north and Trälleborg in the south. Across Sweden, moreover, there went a stream of parcels by post, in both directions, for prisoners. The Swedish postal service dealt with 12,700,000 parcels of this kind. The Crown Princess was specially interested in collecting books to despatch to the prisoners' camps. Important work was also done in the inspecting of the prisoners' camps in Russia, Germany and Austria-Hungary. Delegates distributed gifts from home among the prisoners: 1,016 railway waggons packed with such gifts passed through Petrograd en route eastwards, and from Russia 1,012 travelled into Germany and 304 into Austria-Hungary. The delegates drew attention to various shortcomings in the German camps and in most cases this resulted in improvements being effected. The conditions in Russia and Siberia were found to be much worse. Delegates' records of what they saw revealed a terrible condition of things in many camps. In some there were 30 deaths a day among the prisoners. Under the guidance of the Swedish delegates new hospitals were established in many places or old hospitals improved, kitchens and baking-rooms being constructed, drains put into order, and large stores of medicines and bandages, etc., being supplied. In Jekaterinburg, for instance, the authorities threw all care for the prisoners entirely on the Swedish delegates within a region of 1,200 sq. miles. Thirty-three hospital buildings were erected in this region, and at some periods a Swedish Red Cross Kitchen established there was able to distribute food to 1,200 men a day. This work was attended with risks. Two delegates were murdered and several died in hospitals for infectious cases. During the Finnish civil war two ambulances were sent to Finland in 1920, and one ambulance was sent to Poland to help in coping with the epidemic there.

The grave privations in many countries after the war due to the scarcity of food aroused deep sympathy in Sweden. Among other steps taken to afford help may be mentioned the welcoming of 20,000 children from Germany and Austria (and in some degree from the Baltic Provinces) to stay in Swedish homes with a view to their regaining health and strength. The homes of both the well-to-do and the poor were thrown open for this. The total amount of money devoted to such acts of helpfulness (including the cost of the children's visits) is estimated at more than 25,000,000 kr., of which the State was responsible for 1,500,000 and the rest was collected by private subscriptions. A detailed report was laid before the International Red Cross Conference in Geneva in 1921. (K. H.)

SWEET, HENRY (1845-1912), English philologist, was born in London Sept. 15 1845. Educated at King's College, London, Balliol College, Oxford, and Heidelberg University, he was a recognized authority on the subject of phonetics (see 21 460-61, 9 507), and a readership in phonetics was specially created for him in 1901 by the university of Oxford. His published works include an *Anglo-Saxon Reader*; a *Student's Dictionary of Anglo-Saxon*; an *English Grammar*; *The History of Language*, and many editions of Old and Middle English Texts. He died at Oxford April 30 1912.

SWETE, HENRY BARCLAY (1835-1917), English theologian, was born at Bristol March 14 1835. He was educated at King's College, London, and Caius College, Cambridge, and in 1858 was ordained. After some years of work in various curacies and livings he became in 1869 theological lecturer and tutor at Caius College. In 1881 he became examining chaplain to the Bishop of St. Albans, and the following year was appointed professor of pastoral theology at King's College, London. In 1890 he succeeded Westcott as regius professor of divinity at Cambridge, and retained this position until 1915, when he retired with the title of emeritus professor. He was in 1911 appointed an hon. chaplain to the King. Swete's works on Biblical texts are of the highest importance. In 1887 he published the first volume of his edition of the Greek text of the Old Testament, completing the series in 1894 (3rd ed. 1901-7), while in 1898 appeared the Greek text of the Gospel of St. Mark, with notes and introduction (2nd ed. 1902) and in 1906 that of the Apocalypse of St. John (2nd ed. 1907). He was the editor of *Cambridge Theological Essays* (1905) and *Cambridge Biblical Essays* (1906), and was a contributor to Smith and Wace's *Dictionary of Christian Biography* (1882-87) and Hastings's *Dictionary of the Bible* (1899-1900). He also produced many historical and critical works, including *The Apostles' Creed in Relation to Primitive Christianity* (1894, 3rd ed. 1899); *Church Services and Service Books before the Reformation* (1896); *Patriotic Study* (1902); *The Appearances of Our Lord after the Passion* (1907; 2nd ed. 1908), and *The Last Discourse and Prayer of Our Lord* (1913). He died at Hitchin May 10 1917.

SWIMMING: see SPORTS AND GAMES.

SWINFEN, CHARLES SWINFEN EADY, 1ST BARON (1851-1919), English lawyer and master of the rolls, was born at Chertsey, Surrey, July 31 1851. He was educated privately, and in 1874 was admitted a solicitor, but in 1879 he was called to the bar, having been during his period as a student a pupil of Cozens-Hardy. In 1893 he became a Q.C., and in 1901 was raised to the bench of the Chancery division and knighted. In 1913 he became a lord justice of appeal, and in 1918 master of the rolls in succession to Lord Cozens-Hardy. He retired in 1919 and was raised to the peerage only a few weeks before he died in London Nov. 15 1919.

SWITZERLAND (see 26 238).—Before dealing with the affairs of Switzerland during 1909-21, a note may be made on a curious theory recently put forth, especially in Romance Switzerland, that the Swiss Confederation is "the oldest republic or democracy in the world." Now certainly a "king" has never ruled in Switzerland (save in the case of Neuchâtel before 1857), nor since 1648 has any emperor ever had any claim on the allegiance of the Swiss. But then we must recollect that till 1798 Switzerland never had a *single* head, whatever he might be entitled. If we take the term "republic" to mean a "democratic Government," it is quite true that there were (and are) "republics" of that kind in various regions of Switzerland (e.g. Schwyz), but what is true of a part is not true of the whole. Again, before 1798 there was no Central Government at all in Switzerland, while it was only in 1848 that it first possessed a "President" (with very limited powers). But there was a president already in 1787 in the United States of America, while the "free communities" or "republics" of Andorra (in the Pyrenees) and of San Marino (Italy) are far older than any such in Switzerland. Naturally the use of the word "*Republik*" by certain cantons before 1798 (e.g. the "*Stadt und Republik Zürich*") referred to the rural districts of each, and these by no means enjoyed "democratic government"

at the hands of their respective towns. The fact that in 1848 the first "democratic Swiss Constitution" (still in force so far as regards the practical details relating to the Central Government) was avowedly based on that of the American republic is sufficient to disprove the quaint theory that Switzerland is the (in any sense) "oldest Republic in the world." The reverse is really more nearly the case. In neither of the two ordinary senses of "republic" is this theory even approximately accurate.

Population.—As regards resident population, the results of the last two Swiss censuses, Dec. 1 1910, and Dec. 1 1920 (only the provisional results, published in Feb. 1921), were as follows:—

	1910	1920
Total	3,753,293	3,861,508
Languages		
German	2,594,298	.. 1
French	793,264	.. 1
Italian	302,578	.. 1
Romansch	40,122	.. 1
(Other languages)	23,031	
Religions		
Protestants	2,107,814	2,218,589
Roman Catholics	1,593,538	1,586,826
Jews	18,403	20,955

¹ Figures not published up to Jan. 1 1922.

The decrease in the number of the Roman Catholics is mainly due to the fact that in 1910 the "Christian Catholics" (Old Catholics) were reckoned among them, whereas in 1920, for the first time, they were counted separately, the number given, however (56,250), being greatly exaggerated, since in Tessin (where there is none of this sect) many Roman Catholics described themselves as such under some error. It is noteworthy that the Jews were in 1850 only 3,145 in number, but in 1910 already 18,403, and in 1920 20,955.

In five cantons the population has diminished (Outer Rhodes of Appenzell, St. Gall, Tessin, Vaud and Neuchâtel). In recent years there has been much fear expressed in Switzerland that the non-Swiss were increasing too rapidly for the welfare of the land. This no doubt was due to the vast immigration of German, French, and Italian workmen, who asked lower wages than the Swiss, and, when settled down, became exempt from military service in their native land. During the World War many returned home, and so the figures are not so alarming as was feared at one time. Here is a complete list:—

1860	114,983, of which 1,202 were British subjects;
1870	150,907 (British subjects 2,297)
1880	211,035 (British subjects 2,812)
1888	229,650 (British subjects 2,577)
1900	381,424 (British subjects 3,535)
1910	552,011 (British subjects 4,118)
1920	410,983 (British subjects, figures not available).

Thus the percentage rose from 57 per thousand in 1860 to 79 in 1888, and to 116 in 1910, the culminating point being reached in 1900 with 147, so that the 1920 figures of 106 show a distinct decrease, largely due, like the diminution of the Roman Catholics, to the greater number of French citizens who have gone from Geneva back to France. In 1920 the 12 most populous towns in Switzerland (number of residents) were: Zürich, 205,892 (190,733 in 1910); Geneva, 138,034 (123,153 in 1910); Basle, 135,134 (132,276 in 1910); Berne, 103,990 (90,937 in 1910); St. Gall, 69,651 (75,482 in 1910); Lausanne, 67,852 (64,446 in 1910); Lucerne, 43,696 (39,339 in 1910); La Chaux de Fonds, 37,591 (37,751 in 1910); Winterthur, enlarged, 49,491 (46,384 in 1910); Bienne, enlarged, 34,414 (32,401 in 1910); Neuchâtel, 22,951 (23,741 in 1910); and Fribourg, 20,468 (20,293 in 1910). No other Swiss town has a population attaining 20,000, though Schaffhausen is not far off with 19,930 (18,101 in 1910). There are also 14 Swiss towns with populations below 20,000, but over 10,000. The increase in the case of Berne is due to its absorption of the suburb Bümpliz, etc., and in the case of Bienne to increased prosperity, while the decrease in the cases of St. Gall, of La Chaux de Fonds and of Winterthur are to be accounted for by industrial depression, and the departure of many workmen.

As the "Conseil National" is elected in the ratio of one member for 20,000 of the total population or fraction surpassing 10,000, the new census will increase its members by eight, so that henceforth it will have 197 members.

Politics.—The members of the Swiss Federal Executive (*Bundesrat*) were almost all changed in the period 1910-20, so that in 1921 the seniors were G. Motta (first elected in 1911), and E. Schulthess (first elected in 1912). The five other actual members had all entered the Council since 1917—R. Haab in 1918, Karl Scheurer, E. Chuard, and J. Musy, all in 1919, and H. Hüberlin in 1920. E. Chuard was the oldest in years (b. 1857), while J. Musy was born in 1876. Thus the Council had been

greatly rejuvenated. Six members were Radicals, Signor Motta being the only Conservative and Roman Catholic.

The recent presidents of the Swiss Confederation (little more than the chairmen of the Federal Executive) have been A. Deucher (1900), R. Comtesse (1910); M. Ruchet (1911), L. Forrer (1912), E. Müller (1913), A. Hoffmann, (1914); G. Motta (1915), C. Decoppet (1916), E. Schulthess (1917), F. L. Calonder (1918), G. Ador (1919), and G. Motta (1920), while the president for 1921, E. Schulthess, would in 1922 be succeeded by the vice-president, R. Haab. Of late years the Political Department (*i.e.* the Ministry of Foreign Affairs) has become specially important. A resolution of the Federal Executive in 1917 decided that this important department should *ipso facto* be attributed to the president. But, as the president changes annually, this plan was soon found very inconvenient, and so in 1920 a return was made to the older system that each councillor should retain the department assigned to him. Hence G. Motta would be Foreign Minister till Jan. 1 1923, when the date of fresh election came round again.

The Swiss people adopted by a popular vote the principle of proportional representation for elections to the "Conseil National" in Oct. 1919. But though it was expected that the Socialists would win many more seats they only won much fewer. The Radical majority was reduced from 102 to 60, in the Assembly of 180 members, thus losing its absolute majority over all other parties combined, but remaining the strongest single group. Forty-one Socialists (in 1917 but 19) and as many Conservatives were elected, and the new "Citizens and Peasants" party (a split from the Radical party) obtained 28 seats.

Proportional representation was also winning its way in the cantons, Aargau and Fribourg adopting it in 1920, followed in 1921 by Berne and the Valais. Thus 18 of the 22 cantons approved it. Indeed in 1920 the canton of Fribourg, hitherto reckoned one of the most backward as to the recognition of popular institutions, made a great advance, accepting in one day the facultative referendum, the initiative, the election of the Executive by the people, and that of the Legislature by proportional representation. A number of Federal votes have been taken in recent years. The constitutional amendments related to infectious diseases (1913), the creation of an administrative court (1914), the levy of a war tax (1915), the imposition of a stamp tax on certain business papers (1917), regulations as to waterways (1918), a renewed war tax (1918), entry of Switzerland into the League of Nations (1920), and regulations as to hours of work (1920). A law (facultative referendum) as to sick insurance was also accepted in 1912. But of the "Initiatives" two were rejected (proportional representation in 1910—accepted, however, in 1918), and a Federal tax in 1918, but in 1919 the detailed regulations as to the working of proportional representation in the "Conseil National," and a law abolishing gaming houses were accepted. Of four later votes, all in 1921, those relating to popular approval of international treaties of a certain length, and new regulations as to motor-cars and to aviation were accepted, but a fourth relating to military courts of justice was rejected.

At the very beginning of the World War (Aug. 3 1914) the Federal Parliament handed over to the Federal Executive certain extraordinary (emergency) powers of acting, and these powers, excluding all obligatory popular votes, were found to be very convenient by the Federal Executive.

The entry of Switzerland into the League of Nations was accepted by a popular vote on May 16 1920, the majority in favour (mainly from the French-speaking cantons) being 97,051 votes and by 11½ to 10½ cantons. But in Feb. 1921 the Federal Executive declined to allow the passage through Switzerland of troops, raised to act as police in the case of the Vilna plebiscite.

Some of the members of the former Austrian Empire have sought a nearer connexion with Switzerland. Liechtenstein was indeed admitted into the Swiss postal, telegraph, and telephone system. But the Vorarlberg (and for similar reasons the Tirol) had not up to Aug. 1921 succeeded in being admitted as Swiss cantons, there being great fear felt in Switzerland of increasing the German-speaking population, and particularly of augmenting the number of strict Roman Catholics.

Finance.—The finances of the Swiss Confederation were in 1921 (so said M. Musy, the Swiss Finance Minister) in a difficult position. Their backbone, in the matter of receipts, even in the pre-war period, was the amount of the customs' duties. But even at that period these produced less than heretofore. The last year when they showed an increase was in 1912 (£3,500,000). After that time the decline was pretty steady, and the deficits higher and higher. It has been estimated that, while in 1913 they sufficed to defray about 84% of the total expenses of the State, in 1919 the amount met only 28% of these expenses (in 1913 £3,360,000, and in 1919 only £2,520,000). And these expenses steadily increased after the outbreak of the war, though, of course, Switzerland was not one of the belligerent Powers. The deficits since 1914 are as follows—1914, £901,000; 1915, £862,000; 1916, £665,000; 1917, £2,000,000; 1919, £2,475,000, and 1920, £3,980,000—in 1920 the receipts were £13,740,000, and the expenses £17,720,000. Despite the formal assurances of neutrality received from the principal combatants, the War Minister of Switzerland thought it essential to guard all its frontiers with a strong military force, and to erect costly new fortifications (as at Murat), so that at the end of 1920 the total "mobilization expenses" amounted to no less than £47,500,000, while the military expenses in the accounts for 1921 were £2,880,000, and that only an estimate far inferior to the demands of the military authorities. Large loans (nine in number, to the total amount of some £31,200,000) have been contracted, but on these heavy interest has to be paid. Exchequer bills for two to five years at 6% were also issued in order to assure the supply of necessities of life. Special taxes were imposed, first a war tax (which produced £4,400,000), then a tax on war profits (which produced £11,120,000), next a "renewed" war tax (to last 16 years). The increased salaries and wages of the army of federal officials (including the railwaymen) were a further burden, and, naturally, as the cost of living increased, there came a fresh rise of salaries and wages to meet it—a vicious circle. Even the telegraph and telephone rates had to be raised, not to speak of the postal charges, so that while formerly a letter within Switzerland cost only 1d. it cost 2d. in 1921 and a post card 1d. in lieu of ½d. The charges on foreign correspondence have also been raised, so far as regards the transit from Switzerland to the outer world, for a letter from 2½d. to 4d., and for a post card from 1d. to 2½d. As Switzerland produces very little in the way of raw materials, such as coal, these had to be bought at high prices, a fact which further raised the cost of travelling, hotel prices, and of all articles of home consumption. The only persons who have not felt these raised prices are the self-sufficing (or nearly so) peasants, who, in some cases, have even made large profits by the sale of their milk, cheese, butter, etc. Naturally the towns felt this rise to an extraordinary extent, and great distress and lack of employment resulted. The only cheering symptom, from the Swiss point of view, was that the currency exchange was almost everywhere favourable to Switzerland, save as regards American money. An attempt has been made (Feb. 1921) to raise provisionally certain customs duties but at Protectionist rates, so that the interests of the consumers are being sacrificed to those of certain trades, as well as (also provisionally) to limit imports to a certain extent. In 1912 the customs duties amounted to 6% of the value of the goods imported, but in 1920 not even to 3 per cent.

Hence the deficit in the Federal budget for 1921 was put at five or six million pounds, a huge amount for a country with under four million inhabitants. If the Federal finances were in this state, the cantonal and communal finances were no better.

It must be borne in mind that the direct taxes are paid by a very small minority of Swiss. In the case of the direct taxes the total amount, from 1914 to 1920, was about £70,000,000, while the indirect taxes only brought in some £18,000,000.

Switzerland is still predominantly an agricultural country, so that the majority of voters are peasants, with very narrow views. The industrial population is very much weaker politically, and is regarded with great disfavour by the Agrarian party, which desires, for its own objects, to set up a "Chinese wall" round Switzerland. But the land must have other manufactures than chocolate, condensed milk, cheese, etc., and thus must import much which has to be paid naturally by its exports. Yet the narrow "Cantonal spirit" is still widely diffused in Switzerland.

The annual deficits on the Swiss State railways are especially great. It was officially reckoned that in 1918 the total Federal debt had attained a height of about £33 per head of the population, whereas in 1912 it had only been £17.

Army.—Formerly detailed annual accounts as to the Swiss army (a purely militia force) were published. But since the outbreak of the war these accounts have no longer been issued. But an indiscretion of the semi-official Bernese newspaper, the *Band of Berne* (June 23 1920), tells us that in June 1920 the numbers were 337,282, of whom 71,993 formed the "second reserve," the rest falling into the "Auszug" or "Elite" and the "Landwehr." The "Elite" includes the younger men from 20 to 32, and the "Landwehr" or first reserve those between 33 and 40, while the "Landsturm" or reserve proper is composed of men between 41 and 48.

At the beginning of the war Col. Ulrich Wille was elected the "General," while Col. A. T. L. Sprecher von Bernegg became chief

of the staff. It was thought necessary to guard all the Swiss frontiers, a policy which cost £47,500,000, and disorganized industry and agriculture to a very great extent. The German-speaking troops were sent, as far as possible to the Jura or the French-speaking or the Italian-speaking regions, while the French-speaking soldiers looked after the German-speaking districts. The object was to prevent any fraternization with the troops of the belligerents. Much inconvenience was caused by this mobilization. The military organization was tightened up on the lines of the German army, and this greatly bothered the free Swiss citizens.

Naturally the military budget increased greatly, amounting in 1921 to £3,000,000, though this represented a reduction of about £250,000 on the demands of the military authorities. This great increase is to be explained in part, at least, by the increased cost of material. In 1910 the annual cost amounted only to £1,680,000.

Agriculture, Commerce and Railways.—(censuses of cattle have been frequently made. In 1866 there were 553,205 cows, in 1886 663,102, in 1906 785,950, in 1911 796,909, in 1916 849,011, but in 1919 738,896 and in 1920 only 729,999. The great fall in the numbers is commonly attributed to the huge purchases of milch cows made during the war by Austrian and Hungarian cattle dealers, for export to Germany. Hence came a milk famine, and milk had to be "rationed." Potatoes and other such produce were also rationed and each householder had to plant them on his land, however unsuited for this kind of cultivation.

In 1920 foot-and-mouth disease raged furiously in all parts of Switzerland, and even intercourse between neighbouring valleys was forbidden in order to try to stop the spread of the infection.

During the war certain branches of Swiss commerce flourished much, for, against the wishes and instructions of the authorities, there was much smuggling of all kinds of goods over the frontier, especially towards Germany and France, which, naturally enough, are Switzerland's best customers. The imports were often less than the exports. But in 1915 they were nearly equal in money value, the imports being slightly more than the exports. However, in 1916, the reverse was the case, the exports being £99,000,000, and the imports £93,000,000, but in 1917 the imports had again the best of it. In 1918 the imports amounted to about £96,000,000, and the exports to about £78,000,000 (Great Britain ranked third in each case). In 1919 the exports amounted to £136,000,000, the highest figure ever attained, and the imports to £143,000,000. But in 1920 the imports rose to the prodigious figure of £169,000,000, while the exports dropped to £131,000,000.

As coal is practically non-existent in Switzerland it must be imported, naturally at considerable cost. Hence the imported supply had to be strictly "rationed" during the war, and the price increased enormously, especially in the case of domestic consumption. Of course, the factories suffered much, and the railways even more. Hence the electrification of the latter was pushed on as quickly as possible. But it was not possible to do this all at once, and so one saw locomotives driven by means of logs of wood. The number of trains was reduced, at one time very much indeed, and the fares pushed up to a great degree, which much hindered communications, even within the country. The first electrically-driven train went through the St. Gotthard tunnel early in 1921. The Lötschberg railway was opened in 1914, just before the outbreak of the war, and thus its prosperity was greatly let and hindered, while on the Valais slope, above Brieg, the unstable nature of the ground has caused many landslips, and thus entailed many costly repairs. But the great scheme for connecting the two stations in Geneva has been indefinitely postponed, owing to its excessive cost.

Social.—In 1912 a vast scheme of insurance against sickness and accidents was accepted on a popular vote. But up to 1921 money was lacking to put it into operation, even though unsuccessful attempts had been made to " earmark " certain items of the revenue.

As everywhere else in Europe the unemployment problem was troublesome in Switzerland. The militia employed in the great mobilization came home, unused to work as before, while work was scarce owing to the lack of money, the higher cost of living, and the rise in the salaries and wages of nearly all classes. Naturally this want of employment was felt most in and near the great Swiss towns. And here came in a fresh complication—the lack of dwelling houses and flats. This was, in part, due to the rush from the country to the towns, and the crisis became very acute, so that in Berne, at least, all foreigners were ordered out of the town, so as to procure lodgings for Swiss workmen. In the rural districts neither unemployment nor lack of dwelling houses was felt to anything like the same degree, though, no doubt, they existed to a certain extent. But these rural regions are inhabited by peasants who do not easily move from their homes, and are occupied in the cultivation of their small bits of land. As in Switzerland there are few persons of means independent of a trade or a profession, the disturbance in social life was very great, while the high taxes and high wages limited the power of employing labour.

Ecclesiastical.—There were several welcome symptoms of the cessation of the " Kulturkampf," or religious strife following on the decrees of the Vatican Council. On Sept. 1 1920, a papal nuncio for Switzerland was named, for the first time since 1873, in the person of Monsignor Luigi Maglione, titular archbishop of Caesarea.

He was already favourably known in Switzerland by reason of his love for that country, and his devotion in the case of prisoners of war and sick children. In Feb. 1921, the canton of Berne at last resumed its full legal responsibility for the reconstituted diocese of Basle, after holding aloof for many years, and thus recognized the bishop as spiritual head of the diocese, thus allowing him full liberty of exercising his functions within the canton for an unlimited period (and no longer for five or 10 years, as heretofore). Again, in the census of 1920 the " Christian Catholics " (the Swiss " Old Catholics," who previously had been included among the Roman Catholics) were numbered apart, though by reason of some error in the case of the canton of Tessin their number was put at 56,250; the real number is believed not to exceed 35,000 to 40,000.

On the other hand the Pope laid claim to the direct nomination of the bishop of Sion in the Valais.

The new census has put an end to the topsy-turvy fact that in the canton of Geneva the Roman Catholics outnumbered the Protestants—so many French Roman Catholics have returned to France that the balance has been reversed.

Mention may be made of the fact that, in 1910, in the canton of Basle, the separation of Church and State was carried out, while in the same year women obtained the right of voting in the disestablished Protestant church of Geneva.

In the summer of 1920 reunion conferences were held both at Beatenberg and in Geneva, but almost wholly between various Protestant denominations.

The World War Period.—During the fateful days immediately before the war broke out in 1914, the uncertainty whether there would really be war or whether commonsense would prevail kept the whole of Switzerland in a state of feverish anxiety, and when the loaded dice fell, very many persons in Switzerland were seized with panic. A wild assault was made on all provision establishments which supplied the necessities of life, and these were bought in mad fashion and in quantities far above what was required. In many families stores of eatables were still found after the lapse of two years, and that quite apart from what had been spoilt. The banks and other establishments of a like kind had to withstand a regular siege, for everyone desired to get his property back. This haste had finally to be restrained by orders issued by the Government. As if by enchantment coins of small denominations disappeared from circulation. Not even at the post-offices was it possible to change Swiss banknotes for large sums. It was especially hard on the foreign tourists who were surprised by this sudden war. No one was any longer willing to change their foreign banknotes and cheques, formerly cashed so eagerly. Only the hotel keepers found themselves forced to receive cheques in payment for their accounts, and that despite the danger of incurring great losses by this act of friendship.

On the Swiss frontiers the blocking of all communications took strange forms. A typical case was that of Basle, close to the northern frontier. The tourists rushed in by thousands, and the railway trains were enormously delayed. With the keenest anxiety everyone sought for a carriage, a motor car, or some kind of cart so as to reach the frontier as easily and as quickly as possible. Many, whose cash had disappeared in consequence of the difficulties caused by the exchange, had to set out on foot, burdened with their luggage, to cover the great distance. These carts themselves were heavily laden with luggage, trunks and band boxes, while high up on these artificial mountains were perched travellers of every land, who to-day shared their common hard fate peaceably, but on the morrow were to oppose each other as enemies. Here was a German professor clothed in homespun, there an Englishman in tweeds, near by were some merry Belgian ladies with huge hats and elegant parasols, and, on top of all, countless schoolboys with caps of diverse colours. So was it all day long in the town. All this wild confusion was caused by the sudden interruption of international communications and the closing of the frontiers.

Thousands also were deprived at one fell stroke of their daily bread. Such were chiefly Italians, who desired to regain Italy over the St. Gotthard or the Simplon, often with only a little cash, sometimes quite penniless, and who were blockaded in Basle, and in incredible numbers, finally some 40,000 of them. All these unfortunates had to be cared for till it was possible for them to resume their journey. Quarters were found in private villas and other dwelling houses for the sick women and children. The Coöperative Society of Basle sent great carts filled with

bread and milk, private benevolence made gifts of tea and other eatables. School houses and gymnasiums gave shelter to these unhappy, homeless Italians as far as quarters could be found anywhere, but a great number had to camp out in the open. Only when the great rush had somewhat abated was it possible to facilitate their return to their own country.

Side by side with these arrangements military preparations were carried out in Switzerland. On July 31 1914 the entire Swiss army was warned to be ready, and as early as Aug. 1 the order to mobilize was given. The first day for this was Aug. 3, and two days later the mobilization was quite complete. The troops were ordered to the frontiers which till now had been guarded in part by the second reserve (Landsturm), called out first of all. At the same time (Aug. 3) the Swiss Parliament gave the Swiss executive unlimited powers, even in financial matters. Col. Ulrich Wille was named as commander-in-chief, and Col. Sprecher von Bernegg as chief of the general staff. As it was hoped that the war would not last very long, the mobilized troops went off joyfully to the frontiers. The belligerent States solemnly assured Switzerland of their intention of observing its neutrality, a declaration which brought about a certain amount of relief. When finally the principal operations of war were seen to be taking place far from the Swiss frontiers, the Swiss people were able to think of recalling the troops, in order to simplify matters, from the service on the frontiers, though some were later summoned to relieve those actually serving there. But if in Switzerland a sigh of relief arose, the sad fate of Belgium was felt to be a stern warning, and greatly embarrassed the Swiss authorities, military and political, and it was felt to be quite impossible to strip the frontiers of all watching troops. The fact of this monotonous service, and the conviction that the war might possibly last a long time, brought about a certain disinclination for further service of this kind. Besides, such protection of the frontiers threatened to become costly to an appreciable degree. Therefore much criticism was exercised, chiefly by the Socialists, who especially blamed what, from their point of view, were the mainly needless fortifications around Morat, which were regarded as simply a piece of military display and lavishness, and were considered as a partial measure directed against one only of the belligerents. Thus the Swiss authorities had to order certain alleviations and simplifications in this frontier service. In order to satisfy the agricultural interest the peasant soldiers were called out at a period which caused least disturbance in the cultivation of the land, etc.

Among the military war measures must be counted the abolition, from the beginning, of telephonic communications between the different Swiss towns. This caused all the greater rush to the telegraph offices, and yet even these were under the censor, at least so far as regarded foreign countries.

The equipment of the Swiss army in new, field grey, uniforms was carried out in 1915-6. The expense of these new uniforms amounted to about £800,000.

Most unpleasant for Switzerland was the "Affair of the Two Colonels" (Jan. 15 1916), Egli and von Wattenwyl. This pair of Swiss officers were in regular communication with the German and the Austrian military attachés, ostensibly only for supplying such information as affected no Swiss military matters. All the same this "affair" caused great amazement, especially in French-speaking Switzerland, and in the breasts of the Socialists, who saw in this action of two officers of the Swiss general staff an unneutral and unfriendly act as regards the Entente. They were court-martialed, but were acquitted of the charge of infringement of their official duties, and were handed over to the Swiss executive for "disciplinary punishment" because of their conduct against Swiss neutrality. By this they were each sentenced to 20 days' strict arrest, and to suspension as lending officials in the Swiss general staff. Col. Egli demanded his dismissal at once. The Socialists and a delegation of the Government of canton Vaud required the summoning of the Swiss Parliament in order to discuss the "Affair of the Two Colonels."

About the same time the war control of the Swiss railways was established, while a census of Swiss who were not liable to do

military service and of arms in private hands was decreed. A later appeal for well-qualified sharpshooters among Swiss citizens resulted in the volunteering of about 100,000 men, of whom, however, only a small percentage was accepted as being really fit for such military service.

Much bad blood was caused in the Socialist camp, and also among other citizens, by the Swiss Government's decision that punishments for certain purely military offences were to be purged in the penal establishments of Witzwil and of Orbe, while in the case of the officers' confinement in the fortresses of St. Maurice and St. Gotthard alone was directed. Complaint was also made of the alleged rigorous treatment of ordinary soldiers, and of the far lighter treatment of officers charged with offences.

All this occasioned the promotion of an "Initiative" for the total abolition of courts of military justice. Enough signatures were obtained for this "Initiative," but it was later defeated on a popular vote.

It is easy to understand that Switzerland was the special rendezvous of foreign spies, especially the frontier towns and even the capital, Berne. In this respect all the belligerents did their very best. So even the former director of the Bernese tourist bureau, for taking part in an intelligence service in favour of a foreign Power, was condemned to five months' imprisonment and a fine of £8.

As early as Nov. 1916, the Swiss executive resolved to recruit 250 volunteers out of the army to serve as army police, and this for the entire duration of the war mobilization.

Certain troops, especially those from industrial regions, had to be pacified by the Swiss Parliament by increased pay. This scheme did not find support as late as the end of the year 1916, but was adopted in April 1918, and then it was not merely the pay which was increased, but also the amount of food rations carried in the knapsacks, and emergency support in case of need (this in the case of soldiers' families).

The fact, too, must not be overlooked that in cases of discontent with the military service many unfortunate events contributed to this dissatisfaction. One example was the accelerated mobilization of the 3rd Division (May 1917), and the following endurance marches in great heat, in consequence of which many soldiers were made ill, and fell exhausted on the roads. This brought about an exceedingly vehement movement against all military service, and was utilized to the utmost by the workmen.

In June 1917 the Swiss Government had raised the amounts of the emergency family grants in the big towns to about 25 a head per day for grown-up persons, and to 8d. for children, while in the smaller towns the respective amounts were 15. 6d. and 6d. In the same year the length of the relief services was fixed at 2½ months for the younger and active men (Auszug), and at six weeks for the older men of the first reserve or "Landwehr."

Considerable discontent prevailed in French-speaking Switzerland with the chiefs of the Swiss army, who seemed to it too "Germanophile." This went so far that, in course of the discussion by the Swiss Parliament of a report on Swiss neutrality (Aug. 1917), a formal vote of want of confidence was proposed, and the compulsory retirement of the general and of the chief-of-staff demanded. All such proposals, however, were rejected, but they threw a lurid light on the disagreement between French-Swiss and German-Swiss. In the Assembly, however, the assertion of the supremacy of the civil power over the military power was approved, as was also greater economy in the matter of constructing fortifications, etc.

In consequence of the prolongation of the war, and the frequent calling up as reliefs of soldiers without much means, great distress was inflicted on them and on their families, and many could not find work on being released from active service, as their situations had been filled by Swiss citizens exempt from military service and sometimes even by women. In order to alleviate this crying distress a department for the promotion of the welfare of the soldiers was founded by the Swiss executive which gave this department a first contribution of some £18,000 (Aug. 2 1917). Later on came the "National Collection" (a voluntary contribution made throughout Switzerland), which brought in millions

of francs. To stimulate this collection specially large medals of copper, silver, and gold were struck, and also brooches made, all being sold to the people. The term and the institution "For the welfare of the Soldiers" must be understood to include also other benevolent institutes for the soldiers on active service, such as "Soldiers' Homes," some of which were splendid soldiers' institutes where refreshments were to be had cheaply, and which afforded opportunities for reading and for writing letters. We must not pass over the arrangements made for the washing of the soldiers' garments. Not merely was the soldiers' body-linen washed, but their clothes repaired, and in part replaced.

It would be most unjust to pass over the very prolonged occupation of the Swiss frontiers if we did not mention the exertions of the Swiss Red Cross Society. The Swiss Red Cross is managed usually by a board of directors. But at the very beginning of the mobilization (Aug. 2 1914) the Red Cross men were also called up, and a medical man placed at their head as chief. At that moment the Red Cross had at its disposal not quite £6,000. Hence it was resolved to organize a national collection, not merely for actual money, but also for gifts in kind (especially linen and woollen garments), and this idea was eagerly taken up. The money collected amounted to about £84,000, while the gifts in kind flowed in abundantly. As to the latter the Swiss women displayed great zeal. From all sides poured in shirts, socks, and other things, in huge quantities, including bed-linen and objects for use in hospitals. We must note the quaint fact that, over and above what is commonly used by soldiers on active service, many odd gifts were received, such as chemises for women, articles for female toilettes, and even children's toys.

If detailed figures were to be given for the useful objects collected from Aug. 1914 to June 1918 by the Swiss Red Cross Society, such as body-linen, shirts, sheets for beds, etc., the number would run up to several hundred thousands. The shirts, and the like, were specially welcomed by the poorer soldiers, who otherwise would have fallen victims to various diseases arising from the lack of such things, or in winter-time would have been frozen. For many, military service was thus rendered far more endurable.

One of the chief tasks which fell to the Swiss Red Cross was the creation of the so-called "Red Cross Squads." These were composed of men, exempt from military service, who placed themselves voluntarily at the disposition of the Red Cross, and were provided by it with uniforms and all things necessary for a regular "health service." The Red Cross Society itself has a great number of carriages at its disposal, and also sometimes commandeered motor-cars, and prepared them for the transport of the wounded. The troops on active service, like the Medical Corps, also used such vehicles in great numbers.

A further task of the Swiss Red Cross consisted in the training of well-qualified Red Cross women nurses (Red Cross sisters). Besides these there were other training establishments, either religious or lay (the latter are the mother houses which train nurses). At the very beginning of the war the Red Cross reckoned on the services of 960 sisters who could be employed in the care of sick soldiers. Many of these were employed in the huts for the wounded, set up at fixed distances behind the front, and in the military hospitals.

The Swiss army was severely tried by the influenza epidemic in the summer of 1918 and in the following winter, and that too during the general strike (see below). If the Swiss Red Cross had had many claims upon it previously, it was now scarcely able to meet the tremendous demands made upon it, first, by the army leaders, and later on (at first the plague was contemptuously termed "the Spanish grippa") when the epidemic spread to a totally unexpected extent among the non-military population, and the unceasing cries for help from this side resounded louder and louder. As the epidemic spread more and more widely, voluntary help had to be enlisted. Here stepped in the so-called "Sanitarian Associations" (St. John's Ambulance), already closely connected with the Red Cross, and encouraged their members, with a certain amount of training obtained in voluntary sick-nursing courses, to place themselves at the disposition of the afflicted families. The chief work, however, fell upon the Red Cross and its professional trained nurses, and it is amazing how much the Red Cross achieved in this department. About 10% of the professional nurses (sisters) died of their exertions.

In another respect too the Red Cross rendered excellent service. As is well known, the American Red Cross Society gave some £20,000 to the Swiss military nursing department. This sum was employed in creating convalescent homes for the Swiss soldiers who had suffered from influenza. The Swiss executive put this task also in the hands of the Swiss Red Cross, which, however, later on had to make considerable additions to this amount of money.

In consequence of the spread of the influenza epidemic it became necessary either to suspend or to delay the holding of the training

courses for recruits, the subsequent drill courses, and the education of the non-commissioned officers. The percentage of invalid soldiers was unexpectedly high, and as the epidemic was so rapid as to seem like an explosion, it could be combated only with very insufficient means. Hence very caustic criticisms were expressed without reserve. These demanded publicly the dismissal of the chief of the medical department of the Swiss army, who was said to be already overweighed with the care of the "interned" foreign soldiers, and so could pay too little attention to his own Swiss soldiers, and had ordered precautionary measures at too late a period. All kinds of military hospitals, if one can credit the accounts in newspapers of all shades of opinion, presented a very sorry appearance. The care of the foreign interned soldiers was taken away from this Swiss chief medical officer, and also, after an enquiry, he was acquitted of want of attention to his own Swiss soldiers.
